

## AOS 13.15.00 Release Notes

Release Notes

Release Date: January 30, 2012

Notes Revision: February 8, 2012

### Resolved Issues

*These are issues that have been resolved since the previous AOS release (13.14.00)*

Under certain conditions, TCP sessions are not closed down properly due to the firewall dropping the TCP RST segment.

Attempting to configure ppp authentication through the web interface could cause a 503 server error.

In rare cases, a NetVanta 1224 could reboot due to a spanning-tree congestion issue.

Random text from an attached modem can eventually overload the buffer in the console port and cause a reboot.

Fixed a VPN issue with aggressive mode when connecting to Avaya VPN phones

Repeated attempts of connecting to a unit with SSH could cause a reboot.

Input and Output interface counters were not always displaying the correct values.

Using SNMP over a long period of time could eventually cause a unit to run out of memory and reboot
