

## ATLAS Hunting Features

---

***What hunting features are available for switched calls in the ATLAS 800/550 series?***

*The normal hunting sequence for any channels programmed into the Dial Plan of an ATLAS product is to always hunt for the first available channel of the first interface listed in the Dial Plan for a particular Accept Number Criteria.*

*There is also a special hunting feature that is available on PRI and PRA interfaces, (Network or User Termination) called B Channel Selection. When this option is set to Circular on a particular Dial Plan Entry, the hunting sequence for that entry is to hunt for the next higher/lower B channel to the previously used channel. If several PRI/PRA interfaces have the same Accept # Criteria in the Dial Plan List, the calls will only roll over to the second interface if the first interface is completely filled with calls.*

*RBS T1s can be configured for NORMAL, CIRCULAR, or ALIGNED DS0 Selection in the Dial Plan under IFCE CONFIG.*
