Any brand names and product names included in this manual are trademarks, registered trademarks, service marks, or trade names of their respective holders.

To the Holder of this Manual

The contents of this manual are current as of the date of publication. Adtran reserves the right to change the contents without prior notice.

In no event will Adtran be liable for any special, incidental, or consequential damages or for commercial losses even if Adtran has been advised thereof as a result of issue of this publication.

Be advised that certain security risks are inherent in the use of any telecommunications or networking equipment, including but not limited to, toll fraud, Denial of Service (DoS) attacks, loss or theft of data, and the unauthorized or illegal use of said equipment. Adtran OFFERS NO WARRANTIES, EITHER EXPRESSED OR IMPLIED, REGARDING THE PREVENTION, DETECTION, OR DETERRENCE OF TOLL FRAUD, NETWORKING ATTACKS, OR UNAUTHORIZED, ILLEGAL, OR IMPROPER USE OF Adtran EQUIPMENT OR SOFTWARE. THEREFORE, Adtran IS NOT LIABLE FOR ANY LOSSES OR DAMAGES RESULTING FROM SUCH FRAUD, ATTACK, OR IMPROPER USE, INCLUDING, BUT NOT LIMITED TO, HUMAN AND DATA PRIVACY, INTELLECTUAL PROPERTY, MATERIAL ASSETS, FINANCIAL RESOURCES, LABOR AND LEGAL COSTS. Ultimately, the responsibility for securing your telecommunication and networking equipment rests with you, and you are encouraged to review documentation regarding available security measures, their configuration and implementation, and to test such features as is necessary for your network.

Software Licensing Agreement

Each Adtran product contains a single license for Adtran supplied software. Pursuant to the Licensing Agreement, you may: (a) use the software on the purchased Adtran device only and (b) keep a copy of the software for backup purposes. This Agreement covers all software installed on the system, as well as any software available on the Adtran website. In addition, certain Adtran systems may contain additional conditions for obtaining software upgrades.

Conventions

Notes provide additional useful information.

Cautions signify information that could prevent service interruption.

Warnings provide information that could prevent damage to the equipment or endangerment to human life.

Service and Warranty

For information on the service and warranty of AdtranAdtran products, visit the Adtran website at http://www.adtran.com/support.

Export Statement

An Export License is required if an Adtran product is sold to a Government Entity outside of the EU+8 (Austria, Australia, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Poland, Portugal, Spain, Sweden, Switzerland and the United Kingdom). This requirement is per DOC/BIS ruling G030477 issued 6/6/03. This product also requires that the Exporter of Record file a semi-annual report with the BXA detailing the information per EAR 740.17(5)(e)(2).

DOC - Department of Commerce
BIS - Bureau of Industry and Security
BXA - Bureau of Export Administration

Table of Contents

REFERENCE GUIDE INTRODUCTION

This manual provides information about connecting your product, using the Adtran Operating System's (AOS) command line interface (CLI), and executing the commands available with the NetVanta series units and certain Total Access series units.

If you are new to the AOS CLI, please take a few moments to review the information provided in the sections which follow.

If you are already familiar with Adtran NetVanta and Total Access units and looking for information on a specific command or group of commands, please proceed to *Command Descriptions on page 27* of this guide.

AOS UNIT INTRODUCTION

External Parts

To connect and use your new AOS unit, first familiarize yourself with the external features of the unit. For products that have a serial port, it can be located on either the back or front of the unit. If available, this port is marked **CONSOLE** and connects the unit directly to your PC via a standard DB-9 serial cable.

Other features vary from unit to unit, but include power connections, physical interface connections, and status LEDs along the front that indicate the status of your unit. For a more detailed description of your particular product, please refer to the appropriate hardware installation guide available online at https://supportcommunity.adtran.com.

Internal Parts

In order to fully understand product operation and receive the full benefit of the included guides, you should be familiar with the unit's internal parts, which can be divided into five main categories.

1. ROM - Read Only Memory

Read only memory (ROM) is a permanent form of memory stored in chips within the unit and houses information used by the AOS unit on initial startup. Examples of information stored in ROM are the Power-On Self Test, which initializes upon boot up and checks the unit's functionality; the Bootstrap Startup Program, which actually starts the unit; and the basic form of the AOS software.

2. Flash Memory

Flash memory is memory located in a memory chip that is not only erasable, but also reprogrammable, allowing for software upgrades without chip removal. The flash memory in your unit contains the full AOS and can be used to house copies of the configuration files and application images that are used at initial unit startup.

3. CompactFlash® Memory

CompactFlash memory (where available) is memory located on a CompactFlash memory card that is erasable and reprogrammable, allowing software upgrades without chip removal. The CompactFlash memory in your unit can be used to house copies of the configuration files and application images that are used at initial unit startup.

4. RAM - Random Access Memory

Random Access Memory (RAM) is the computer memory that functions as the working memory of your AOS unit. When the unit is on, the RAM provides memory for caching, packet buffering, holding routing tables, and housing the running operating system. When the unit is first powered on, RAM executes the application codes from flash memory and the startup configurations from nonvolatile random access memory (NVRAM), and when the unit is powered off or reset, RAM loses all data.

5. NVRAM - Nonvolatile Random Access Memory

NVRAM is the general name for any RAM that does not lose its information at power down (for example, flash memory). In this case, NVRAM has a separate memory function than the flash memory and is used to house the unit's startup configurations.

6. Interfaces

Interface is the term used to describe how your unit connects with its outside environment. There are a variety of interface categories, as well as interface types. Interface categories include line interfaces, physical interfaces, virtual, and wireless interfaces.

- Line interfaces describe the way you are communicating with your unit (for example, by console or Telnet).
- Physical interfaces describe the way your unit is physically connected to other units or devices (for example, via Ethernet, T3, serial, or asymmetric digital subscriber line (ADSL)).
- Virtual interfaces describe the way your unit receives information, whether by Frame Relay, Point-to-Point Protocol (PPP), virtual local area network (VLAN), or asynchronous transfer mode (ATM), to name a few.
- Wireless interfaces describe the way your unit receives or transmits information without a physical connection. The connectivity is provided through a radio transmission. There are multiple components to a wireless local area network (WLAN) which include access points (APs), radio interfaces, and virtual access points (VAPs).

The user can configure a unit's interfaces through the interface command sets (refer to *Configuration Command Sets on page 16*).

INTRODUCTION TO COMMAND LINE INTERFACE

The CLI is a method used to communicate with your AOS unit. While it describes the method used to communicate, such as by console or Telnet, it also refers to the way information is passed to the unit. As a text-based user interface, the CLI prompts you to input commands line by line when you interface with the AOS unit (hence the name command line interface).

Introduction to Commands

The most important part is understanding that your commands make the AOS unit function. The right commands lead to a fully functioning unit, whereas improperly entered or forgotten commands prevent the unit from functioning. To properly use commands, you must understand what function you want the AOS unit to complete and what syntax the unit understands as instructions. Each command has its own role within the operating system, and it is the responsibility of the operator to become familiar with specific commands and command sets.

How Commands Function

Commands are composed of two main parts. The most important part is the command itself, or the command word. Most command words are short and straightforward (for example, **do**, **exit**, or **configure**). Command words are entered immediately after the command prompt in the CLI.

The second part of a command is its argument. An argument is a specification that modifies the command. In the command **show flash**, **show** is the command word and **flash** is the argument because it modifies the command **show**. Commands can have any number of arguments, depending upon the action required of the unit, and in some instances you have a choice of arguments to use.

Optionally, some commands use variables with the argument to specify information relevant only to your AOS unit. These variables are identified with the greater-than (<) and less-than symbols (>). The description of the information required is contained within the symbols and displayed in *italics*. For example, the following command provides the command **clock**, argument **set**, and includes the variables <*time*>, <*day*>, <*month*>, and <*year*>:

clock set <*time*> <*day*> <*month*> <*year*>

AOS Command System

Adtran products, training tools, and manuals follow a specific system for entering and referencing commands. Items that are typed in **bold** are the required commands and arguments for a certain action. In the following documentation, you will see commands in bold after an example prompt. They look similar to this:

>enable
#configure terminal
(config)**#line telnet 4**
(config-telnet4)#

In the example above, the characters >, #, (config)#, and (config-telnet4)# are the prompts after which commands are entered. In this example, the words in bold (**enable**, **configure terminal**, and **line telnet 4**) are the entire commands and constitute what should be typed after the prompt. It is important to pay attention to the prompt you are given when communicating with your unit, because certain commands only work in certain modes, which are signified by the prompt. The different prompts and modes are discussed later in this guide.

In certain commands, you are given a choice of arguments. If this is the case, the manual or guide will place the argument in brackets separated by a vertical bar (|) between your choices as seen in this example:

#show [flash | cflash]

Again, remember the # is your prompt, the command word is **show**, and your choices of arguments are **flash** and **cflash**.

Certain commands require you to enter your own information which are called variables. Information within a command line that pertains to your personal unit is set off with the greater-than (<) and less-than symbols (>). The description of the information required is contained within the greater-than and less-than symbols and is displayed in *italics*. For example:

#copy <*file source location*> <*config-file*> **tftp**

In this case, # is your prompt, the command word is **copy**, the information needed from you is the source location of the file you want to copy (<*file source location*>) and the configuration file type (<*config-file*>), and **tftp** indicates the location to which to copy the file.

USING THE CLI

This portion of the Command Reference Guide introduces you to the basic concepts and strategies associated with using the AOS CLI.

Connecting the Unit

For the initial use, the unit should be connected to a PC with VT100 terminal emulation program. To connect the unit, simply connect a DB-9 straight-through male-to-female serial cable to the **CONSOLE** port and to your PC.

Accessing the CLI from Your PC

All products using the AOS are initially accessed using a PC with VT100 terminal emulation program (such as HyperTerminal or PuTTY) and console port cable. If you don't have a VT100 terminal emulation program, you can download PuTTY from the Internet.

Emulation Settings

Once you have connected to the unit, adjust the program settings as follows:

- 9600 baud
- 8 data bits
- No parity
- 1 stop bit
- No flow control

If you are using a VT100 terminal emulation program, name your new connection and set up the new connection. Verify **COM 1** is the type of connection you are using. Once you have entered the program settings and applied them, you should be presented with a terminal window with which to interface with your unit.

Unit Boot Up

After configuring your PC, provide power to the AOS unit and turn it on. The AOS unit begins the boot up process, which includes the following:

- The Power-On Self Test runs. This test checks the unit hardware for normal operation. The hardware includes the central processing unit (CPU), the memory, and the interfaces.
- The Bootstrap Startup Program (factory set in the ROM) runs.
- The Bootstrap Startup Program is read by the unit to discover the proper source for the operating system image.
- The operating system image is loaded into RAM.
- The configuration file saved in NVRAM is loaded into RAM, where it is accessed by the unit and then executed one line at a time.

If no configuration file is found in NVRAM (there will not be one found on initial setup), you are presented with the following prompt on your PC's VT100 terminal emulation screen:

```
Session Now Available
Press RETURN to get started
```

After pressing return, a prompt appears for communication with your unit.

Understanding Command Modes

As you begin communication, you should understand the command modes. Just as there are different levels of commands in the CLI, there are different modes for commands within AOS itself. Each command mode enables the user to access more commands, and make more changes in the unit's configuration.

The CLI has four command modes: Basic, Enable, Application, and Global. The four command modes are organized in a four-tiered hierarchy with Basic at the bottom, then Enable, then Application, and Global at the top.

Basic Mode

Interaction with your unit begins at the Basic mode. The commands supported at this command tier are limited, as is interaction with the unit itself. The Basic mode prevents users without access to the higher tiered commands from changing the preferred configurations of the unit. The following table describes the Basic mode.

Mode	Access By...	Mode Prompt	Accessible Commands
Basic	Beginning an AOS session	>	• Display system information • Perform traceroute and ping functions • Open a Telnet session

For more information on the Basic mode, please refer to *Basic Mode Command Set on page 45*.

Enable Mode

Enable mode is one step up from the Basic mode. Adtran suggests that a password be required to access the Enable mode. Refer to the quick start guides shipped with your unit and located online at https://supportcommunity.adtran.com for more information on configuring a password.

From the Enable mode, you can access the configurations of your product, as well as handle how your unit boots and runs, among other things. The following table describes the Enable mode.

Mode	Access By....	Mode Prompt	Accessible Commands
Enable	Entering **enable** while in the Basic mode as follows: **>enable**	#	• Manage the startup and running configurations • Enable and disable **debug** commands • View **show** command output • Enter any of the configuration modes

For more information regarding the Enable command set, refer to the *Enable Mode Command Set on page 94*.

Global Mode

The Global mode is the highest level tier within AOS. The Global mode allows the user to make changes regarding the entire product system. All of your system's configurations are accessed through the Global mode. From this level, you can access not only line configurations, router configurations, and interface configurations, but also any other configurations or parameters on your system. The following table describes the Global mode.

Mode	Access By...	Mode Prompt	Accessible Commands
Global	Entering **config** while at the Enable mode as follows: **>enable** **#** **#config**	(config)#	• Set the system's Enable-level password(s) • Configure the system global IP parameters • Configure the SNMP parameters • Enter any of the configuration modes

For more information on the Global mode, refer to *Global Configuration Mode Command Set on page 1149*.

Application Mode

The Application mode is accessed from the Enable mode. Enable mode access is necessary to access the Application mode. This mode is used to configure applications on the AOS unit, such as Y.1731 or network synchronization (Network Sync). The following table describes the Application mode.

Mode	Access By....	Mode Prompt	Accessible Commands
Application	Entering **application** while in the Enable mode as follows: **>enable** **#application**	(app)#	• Configure the Y.1731 application • Configure the Network Sync application

For more information on the Application mode, refer to *Application Command Sets on page 1991*.

Understanding Configurations

Configurations are the means by which you set up your unit and system according to your personal requirements and preferences. You must configure your unit to work within your network, based on your hardware and communication systems.

All configurations are accessed through the Global Configuration mode. By typing in **config** at the Enable mode prompt, you will be ready to specify the configuration you want to access.

For each configuration, enter the word or phrase that correlates with the system you are configuring. There are different command sets for each type of configuration. These command sets are detailed in the following section.

Configuration Command Sets

The configuration command sets are broken down into categories of similar functions. For example, all commands pertaining to configuring the interfaces are grouped together, as are commands for configuring routing, configuring security and services, and so on. The following sections introduce each category of command sets and the command subsets organized within them in this guide. For a complete list of command sets and their reference pages, refer to *Command Descriptions on page 27*.

Interface Command Sets

Interface commands configure the physical and virtual interfaces in which you communicate with your device. Not all AOS units have all of the interface types explained in this section. Wireless interfaces are also included for the units that support it. The following table gives an example of the each interface command set. For a more detailed description, refer to *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Line Interface	Specifying a line (console, Telnet, SSH) at the Global Configuration mode prompt as follows: >**enable** **#config terminal** (config)**#line console 0**	(config-con0)#	• Gain initial access to the unit before configuring network settings • Configure the console or terminal settings (data rate, login password, etc.) • Create Telnet logins and specify their parameters (login password, etc.)
Physical Interface	Specifying an interface at the Global Configuration mode prompt as follows: >**enable** **#config terminal** (config)**#interface adsl 0/1**	(config-adsl0/1)#	• Configure the parameters of your physical connections • Configure your physical network
Virtual Interface	Specifying an interface at the Global Configuration mode prompt as follows: >**enable** **#config terminal** (config)**#interface frame-relay 1**	(config-fr 1)#	• Determine the parameters of information flow • Configure your unit's methods for communicating with other devices • Configure network protocols; such as ATM, Frame Relay, PPP, VLAN, etc.
Wireless Interface	Specifying a wireless interface at the Global Configuration mode prompt as follows: >**enable** **#config terminal** (config)**#interface dot11ap 1 ap-type nv16x**	(config-dot11ap 1)#	• Configure your unit's wireless parameters; wireless access points (APs), access point radios, and virtual access points (VAPs) • Configure how your wireless network will integrate with your wired network

Carrier Ethernet Command Sets

Carrier Ethernet interfaces consist of virtual interfaces that are only available on specific AOS products used to interface with Metro Ethernet network (MEN) and carrier Ethernet technologies. In this guide, commands pertaining to these virtual interfaces are listed in their own section to separate them from the more commonly used interfaces. The Carrier Ethernet section is divided into EFM NIM 2 Ethernet, Carrier Ethernet Services, and Y.1731. Each section has been further divided into additional sections containing command sets for specific configuration functions dealing with each of these technologies.

Ethernet in the First Mile (EFM) NIM2 Ethernet command sets pertain to the Metropolitan Ethernet Forum (MEF) Ethernet interface which functions as the user-network interface (UNI) in AOS products with the second-generation EFM network interface modules (NIMs). The MEF Ethernet interface is a virtual interface used by AOS products to interface with the MEN and carrier Ethernet technologies. The MEF Ethernet interface is used as the Layer 2 and 3 wide-area network (WAN) interface.

Carrier Ethernet Services command sets pertain to the MEF Ethernet virtual connection (EVC) which connects two endpoints (for example, the EFM group and the MEF Ethernet interface) and passes Ethernet service frames through these endpoints.

Y.1731 command sets pertain to EFM configurations on the AOS device that use the Y.1731 protocol. The Y.1731 commands allow you to configure how your unit will behave as it employs Y.1731 EFM over your network.

The following table gives an example of the carrier Ethernet commands. For a more detailed listing of commands, refer to *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
EFM NIM2 Ethernet	Specifying a MEF interface at the Global Configuration mode prompt as follows: >**enable** **#configure terminal** (config)**#interface mef-ethernet 0/1**	(config-mef-ethernet 0/1)#	• Configure the MEF Ethernet interface • Configure EFM bonding groups to provide EFM capabilities across WAN interfaces • Configure EVC attributes • Set parameters for policer policies to limit outbound traffic bandwidth • Configure EVC map attributes and associate with an EVC and a UNI

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Carrier Ethernet Services	Specifying an EVC from the Global Configuration mode prompt as follows: >enable **#configure terminal** (config)**#evc DATA** (config-evc-DATA)#	(config-evc-DATA) #	• Create and configure EVCs • Configure EFM groups. • Configure EVC queues, policer policy, map and shaper. • Configure the system control EVC • Set parameters for inband IP network interface for system management and control
Y.1731	Specifying which Y.1731 feature you wish to configure at the Global Configuration mode prompt as follows: **>enable** **#configure terminal** (config)**#ethernet y1731 meg char-string MEG1** (config-y1731-meg MEG1)#	(config-y1731-meg MEG1)#	• Specify the MEF traffic shaper rate • Specify the interface to which the MEF shaper is applied • Configure the Y.1731 maintenance entity group (MEG) and Y.1731 local MEG endpoint (MEP) • Specify the frame delay, frame loss, and traffic shaper settings for Y.1731 traffic • Use Show commands related to Y.1731 settings

Routing Protocol Command Sets

The routing command sets serve two functions. Routing commands not only address the manner in which your unit routes and disseminates information, but they also provide an additional level of security for your network. Routing commands include parameters, such as AS path list, community list, and network monitoring, and they determine whether your unit routes via Routing Information Protocol (RIP), open shortest path first (OSPF), or protocol-independent multicast (PIM) sparse.

The following table gives an example of the routing command sets. For a complete list of routing commands, refer to the *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Routing	Specifying which routing parameter you wish to set at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#router ospf**	(config-ospf)#	• Determine which devices are compatible with your network • Determine how your unit routes traffic and information • Configure network monitoring probes, tracks, and responders • Configure the unit's route map

Security and Services Command Sets

The security and services command sets provide methods for you to configure additional security for your unit, as well as determine the types of services you want your unit to perform. Included in these command sets are quality of service (QoS) maps, Dynamic Host Configuration Protocol (DHCP) pools, and route map configurations.

The following table includes an example of the security and services commands. For a more detailed listing of the command sets, refer to *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Security and Services	Specifying the service you would like to perform at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#aaa group server radius myServer**	(config-sg-radius)#	• Map the quality of a variety of services • Set the parameters for the DHCP • Configure access control lists (ACL) and access control policies (ACP) for network security • Configure security services for Radius and Tacacs+ Groups.

Voice Command Sets

Voice command sets configure all aspects of voice functionality within your network. These commands only pertain to AOS devices that support voice as part of their feature set.

The following table describes the different voice command subsets and explains briefly each command set. For a more detailed description, refer to *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Voice Accounts	Specifying the voice account you would like to configure at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#voice user 4444**	(config-4444)#	• Set parameters for user accounts, line accounts, and loopback accounts • Specify the behaviors and permissions of these accounts within the voice network
Voice Groups	Specifying the voice group you would like to configure at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#voice ring-group 1234**	(config-1234)#	• Set parameters for ring groups, operator groups, trunk groups, paging groups, and more • Specify the behaviors and permissions of voice groups, as well as define the members of the groups

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
Voice Services	Specifying the voice service you would like to configure at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#voice autoattendant Example 1212**	(config-aa1212)#	• Set parameters for class of service (CoS) on the voice network • Configure voice features (voicemail, auto attendant, Music on Hold, Find Me Follow Me, etc) • Use voice quality monitoring reporters • Specify the behaviors and permissions of voice features within the network
Voice Trunks	Specifying the voice trunk type you would like to configure at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#voice trunk t01**	(config-t01)#	• Set parameters for analog trunks, T1 trunks, Session Initiation Protocol (SIP) trunks, and more • Specify the behaviors and permissions of these trunks

Virtual Private Network Parameter Command Sets

The virtual private network (VPN) parameter command sets deal with the encryption and security on your private network. To allow you the utmost in security, the VPN parameter commands allow you to configure how your unit will behave as it communicates with other devices. VPN command sets allow you to configure Internet key exchange (IKE) parameters, crypto parameters, and certificate parameters.

The following table gives an example of the VPN parameter commands. For a more detailed listing of commands, refer to *Command Descriptions on page 27*.

Command Set	Accessed By...	Sample Prompt	With This Set You Can...
VPN Parameters	Specifying which parameter you wish to set at the Global Configuration mode prompt as follows: **>enable** **#config** (config)**#crypto ca certificate chain MyProfile**	(config-cert-chain)#	• Determine how your unit authenticates communication • Set the parameters for keeping your unit secure

Using CLI Shortcuts

The AOS CLI provides several shortcuts to help you configure your AOS product more easily. See the following table for descriptions.

Shortcut	Description
Up arrow key	To redisplay a previously entered command, use the up arrow key. Continuing to press the up arrow key cycles through all commands entered, starting with the most recent command.
<Tab> key	Pressing the **<Tab>** key after entering a partial (but unique) command will complete the command, display it on the command prompt line, and wait for further input.
?	The AOS CLI contains help to guide you through the configuration process. Using the question mark, do any of the following: Display a list of all subcommands in the current mode. For example: (config-t1 1/1)**#coding ?** ami - Alternate Mark Inversion b8zs - Bipolar Eight Zero Substitution Display a list of available commands beginning with certain letter(s). For example: (config)**#ip d?** default-gateway dhcp-server domain-lookup domain-name domain-proxy Obtain syntax help for a specific command by entering the command, a space, and then a question mark (?). The AOS CLI displays the range of values and a brief description of the next parameter expected for that particular command. For example: (config-eth 0/1)**#mtu ?** <64-1500> - MTU (bytes)
<Ctrl + A>	Jump to the beginning of the displayed command line. This shortcut is helpful when using the **no** form of commands (when available). For example, pressing **<Ctrl + A>** at the following prompt will place the cursor directly after the **#**: (config-eth 0/1)**#ip address 192.33.55.6**
<Ctrl + E>	Jump to the end of the displayed command line. For example, pressing **<Ctrl + E>** at the following prompt will place the cursor directly after the **6**: (config-eth 0/1)**#ip address 192.33.55.6**
<Ctrl + U>	Clears the current displayed command line. The following provides an example of the **<Ctrl + U>** feature: (config-eth 0/1)**#ip address 192.33.55.6** (Press **<Ctrl + U>** here) (config-eth 0/1)#
auto finish	You need only enter enough letters to identify a command as unique. For example, entering **int t1 1/1** at the Global Configuration mode prompt provides you access to the configuration parameters for the specified T1 interface. Entering **interface t1 1/1** would work as well, but is not necessary.

Searching for Commands in the CLI

The AOS CLI contains several thousand commands, accessible through various command modes and command sets. Finding a specific command, particularly if you do not know the command set in which the command is located, or the entire syntax of the command, can be difficult. To make it easier to find specific commands in the CLI, an algorithmic search tool is provided. This search tool scans the entire CLI for the command you specify, scanning all command modes and sets, and displays the commands that match the specified criteria. This feature can be more useful than the **?** CLI shortcut because it gives the entire syntax of the matching commands, and the search is not limited to the currently active command set.

To search for a command in the CLI, enter the **find** <*input*> command at the Enable mode prompt. The <*input*> parameter is a text string of the command for which you are searching, for example, **sip proxy**. The following example tells the CLI to search for all commands that match **sip pr**. The output displays the matching commands and their associated command set(s).

```
>enable
#find sip pr
Searching....Found 4 commands
Root                : clear sip proxy
Root                : debug sip proxy
Root (2)            : show sip proxy
configterminal (3)  : sip proxy
```

The above example displays all commands in the CLI that match **sip pr**, combining any results that are similar. Note the (2) in the Root command set, indicating two commands with similar syntax in the Enable mode match the criteria, and the (3) in the configterminal command set, indicating three commands with similar syntax in the Global Configuration mode match the search criteria. Command search results are considered to be similar based on three criteria: they are in the same command set (Root or configterminal in the previous example), they use the same root command (show sip proxy or sip proxy in the previous example), and they meet the search criteria (both match sip proxy in the previous example). Search results are combined by default, but you can optionally choose to display all commands by entering the **find /no suppress** <*input*> command for your search. For example, to list all commands that match **sip pr**, enter the command as follows (note the difference in the command output from the previous example):

```
>enable
#find /no suppress sip pr
Searching...Found 7 commands
Root                : clear sip proxy
Root                : debug sip proxy
Root                : show running-config sip proxy
Root                : show sip proxy
configterminal      : sip prefer
configterminal      : sip privacy
configterminal      : sip proxy
```

In addition to specifying that search results are not combined, you can also limit search results to the active command set by entering the **find /current-set** <*input*> command. The optional **current set** parameter limits the search to the current active command set. For example, if you were searching for packet capture commands, and searched all of the CLI, the search returns 13 available matching commands. If you limit the search to the Enable mode only, using the **/current-set** parameter, the search returns only the two packet capture commands available in the Enable mode (note that similar commands are combined in the search results by default; entering the optional **/no-suppress** parameter in addition to **/current-set** parameter will display all matching commands in the set).

```
>enable
#find /current-set packet-capture
Searching... Found 2 commands
debug packet-capture
show packet-capture: (2)
```

Wildcards can also be used when searching for commands in the CLI. Wildcards can be beneficial when you do not know the entire syntax of the command you are looking for. Use the ***** character to specify the search matches anything in place of the *****. Enter the command as follows to search using wildcards:

```
>enable
#find sip*tcp
Searching... Found 3 commands
voice-trunk-sip (2)    : sip-server primary * tcp
configterminal (4)     : sip tcp
configterminal : voip name-service host * sip tcp
```

Performing Common CLI Functions

The following table contains descriptions of common CLI commands.

Command	Description
exit	The **exit** command exits the current command set and returns to the previous command set. For example, when entering **exit** in the Global Configuration mode, you will be returned to the Enable mode. >**enable** **#configure terminal** (config)**#exit** > Your location in the CLI hierarchy determines the command set you will return to when entering this command. If you enter **exit** in the Enable mode you will exit the CLI completely.

Command	Description
end	The **end** command exits the current command set and returns to the Enable mode, no matter what your current location is in the CLI hierarchy. For example, when entering **end** in the T1 Interface Configuration mode, you are returned to the Enable mode prompt. >**enable** **#configure terminal** (config)**#interface t1 1/1** (config-t1 1/1)**#end** >
do	The **do** command provides a way to execute commands in other command sets without having to exit the current command set. The following example shows the **do** command used to view the Frame Relay interface configuration while in the T1 interface command set: (config)**#interface t1 1/1** (config-t1 1/1)**#do show interfaces fr 7**
no shutdown	To activate an interface, enter **no shutdown** from the interface configuration mode. For example, the following command activates the T1 1/1 interface: (config)**#interface t1 1/1** (config-t1 1/1)**#no shutdown t1 1/1**
no	To disable a feature or return a command to its default setting, enter **no** before the command. The following example disables the voice debug messages. >**no debug voice**
copy running-config startup-config	Entering this command in the Enable mode saves changes made to the configuration. This command copies your changes to the unit's NVRAM. Once the save is complete, the changes are retained even if the unit is shut down or suffers a power outage.
show running config	Entering this command in the Enable mode displays the current configuration.
debug	Use the **debug** commands in the Enable mode to troubleshoot problems you may be experiencing on your network. These commands provide additional information to help you better interpret possible problems. For information on specific debug commands, refer to the debug section beginning on *page 285*.
undebug all	Entering this command in the Enable mode turns off any active debug commands.

*The overhead associated with the **debug** command takes up a large portion of your AOS product's resources, and at times can halt other processes. It is best to use the **debug** command only during times when the network resources are in low demand (nonpeak hours, weekends, etc.).*

Understanding CLI Error Messages

The following table lists and defines some of the more common error messages given in the CLI.

Message	Helpful Hints
%Ambiguous command %Unrecognized command	The command may not be valid in the current command mode, or you may not have entered enough correct characters for the command to be recognized. Try using the **?** command to determine your error. Refer to *Using CLI Shortcuts on page 21* for more information.
%Invalid or incomplete command	The command may not be valid in the current command mode, or you may not have entered all of the pertinent information required to make the command valid. Try using the **?** command to determine your error. Refer to *Using CLI Shortcuts on page 21* for more information.
%Invalid input detected at "^" marker	The error in command entry is located where the caret (^) mark appears. Enter a question mark at the prompt. The system displays a list of applicable commands or gives syntax information for the entry.

COMMAND DESCRIPTIONS

This portion of the guide provides a detailed listing of all available commands for the AOS CLI (organized by command set). Each command listing contains pertinent information, including the default value, a description of all subcommand parameters, functional notes for using the command, and a brief technology review. To search for information on a group of commands within a particular command set, use the linked references given below:

IKE Policy	(config)#**crypto ike policy 1** (config-ike)#	*page 5280*

SYSTEM COMMAND SETS

This section includes the following command sets:

BASIC MODE COMMAND SET

To activate the Basic mode, simply log in to the unit. The following prompt displays:

>

The following command is common to multiple command sets and is covered in a centralized section of this guide. For more information, refer to the section listed below:

exit on page 83

All other commands for this command set are described in this section in alphabetical order.

enable

Use the **enable** command (at the Basic Command mode prompt) to enter the Enable Command mode. Use the **disable** command to exit the Enable Command mode. Refer to *disable on page 482* for more information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Functional Notes

The Enable Command mode provides access to operating and configuration parameters and should be password protected to prevent unauthorized use. Use the **enable password** command (found in the Global Configuration mode) to specify an Enable Command mode password. If the password is set, access to the Enable Commands (and all other “privileged” commands) is only granted when the correct password is entered. Refer to *enable password <password> on page 1270* for more information.

Usage Examples

The following example enters the Enable Command mode and defines an Enable Command mode password:

```
>enable
#configure terminal
(config)#enable password Adtran
```

At the next login, the following sequence must occur:

```
>enable
Password: ******
#
```

logout

Use the **logout** command to terminate the current session and return to the login screen.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example shows the logout command being executed in the Basic mode:

```
>logout

Session now available

Press RETURN to get started.
```

ping

Use the **ping** command (at the Enable mode prompt) to verify IPv4 network connectivity. For information on how to verify IPv6 network connectivity, refer to *ping ipv6 on page 55*. Variations of this command include:

ping
ping [ip] <*ipv4 address* | *hostname*>
ping [ip] <*ipv4 address* | *hostname*> <*interface*>
ping [ip] <*ipv4 address* | *hostname*> **data** <*string*>
ping [ip] <*ipv4 address* | *hostname*> **df-bit [0 |1]**
ping [ip] <*ipv4 address* | *hostname*> **dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ip] <*ipv4 address* | *hostname*> **repeat** <*number*>
ping [ip] <*ipv4 address* | *hostname*> **size** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
ping [ip] <*ipv4 address* | *hostname*> **timeout** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **tos** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **verbose**
ping [ip] <*ipv4 address* | *hostname*> **wait** <*interval*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **data** <*string*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **df-bit [0 |1]**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **repeat** <*number*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **size** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **timeout** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **tos** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **verbose**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **wait** <*interval*>

After specifying the target IPv4 address to ping, the other parameters can be entered in any order. Use the **?** *after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

ip	Optional. Specifies an IPv4 ping.
<*interface*>	Optional. Specifies the egress interface when pinging an IPv4 address. Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **ping** <*ipv4 address* | *hostname*> **?** to display a list of valid interfaces.

<ipv4 address | hostname>	Optional. Specifies the IPv4 address or host name of the system to ping. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**). Entering the **ping** command with no specified Internet Protocol version 4 (IPv4) address prompts the user with parameters for a more detailed **ping** configuration. Refer to *Functional Notes* (below) for more information.
data <*string*>	Optional. Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ECHO_REQ packets.
df-bit 0	Optional. Specifies that the Don't Fragment (DF) bit in the IP header is not set.
df-bit 1	Optional. Specifies setting the DF bit in the IP header. This will prevent the ping packets from being fragmented along the way.
dscp	Optional. Specifies the differentiated services code point (DSCP) value.
<*value*>	Optional. Valid range is decimal **0** to **63**. The value can also be specified in hexadecimal by adding a **0x** prefix to the number.
af*xx*	Optional. Specifies the assured forwarding (AF) class and subclass for the DSCP value. Select from: 11 (001010), 12 (001100), 13 (001110), 21 (010010), 22 (010100), 23 010110), 31 (011010), 32 (011100), 33 (011110), 41 (100010), 42 (100100), or 43 (100110).
cs*x*	Optional. Specifies the class selector (CS) value for the DSCP value. Valid range for *x* is **0** to **7**.
default	Optional. Specifies default (000000) DSCP value.
ef	Optional. Specifies expedited forwarding (EF) (101110) for the DSCP value.
repeat <*number*>	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size <*value*>	Optional. Specifies the datagram size (in bytes) of the ping packet. Valid range is **1** to **1448** bytes.
source <*ipv4 address*>	Optional. Specifies the IPv4 address to use as the source address in the ECHO_REQ (or interface) packets. The source IPv4 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.
timeout <*value*>	Optional. Specifies the timeout period after which the ping is considered unsuccessful. Valid range is **1** to **60** seconds.
tos <*value*>	Optional. Specifies the type of service (ToS). The <*value*> can be specified as decimal (**0** to **255)** or as hexidecimal.
verbose	Optional. Enables detailed messaging.
vrf <*name*>	Optional. Specifies the VRF where the IPv4 address exists.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending test packets. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **data** pattern is set to **abcd**.

By default, the **repeat** is set to **5**.

By default, the **size** value is set to **100** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **wait** value is set to **100** milliseconds.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.2	Command was expanded to include the **verbose** and **wait** parameters, also changes were made to the **repeat** and **timeout** values.
Release 17.4	Command was expanded to include the **count** and **interval** parameters. The **repeat** and **wait** parameters were removed.
Release A4.01	Command was expanded to return the **wait** parameter.
Release 18.3	Command was expanded to include the optional **ip** and <*interface*> parameters.
Release R11.1.0	Functional Notes were enhanced to explain parameter behaviour with multiple entries.

Functional Notes

The **ping** command can be issued from both the Basic and Enable modes.

The **ping** command helps diagnose basic IPv4 network connectivity using the Packet Internet Groper program to repeatedly bounce Internet Control Message Protocol version 4 (ICMPv4) ECHO_REQ packets off a system (using a specified IPv4 address). AOS allows executing a standard **ping** request to a specified IP address, or provides a set of prompts to configure a more specific **ping** configuration.

After specifying the target IPv4 address (or hostname) to ping, the following parameters can be entered multiple times and in any order: **data**, **df-bit**, **repeat**, **size**, **source**, and **timeout**. When entering multiple instances of the same parameter, the last entry will be used. In the following example syntax, only the last entries for **data**, **repeat**, and **size** will be used, ignoring previous entries for these parameters:

ping ip 192.0.2.15 size 600 data bbbb repeat 3 size 300 data aaaa repeat 2 verbose dscp cs4 size 200

The following is a list of output messages from the **ping** command:

!	Success
-	Destination Host Unreachable
$	Invalid Host Address
X	TTL Expired in Transit
?	Unknown Host
*	Request Timed Out

The following is a list of available extended **ping** fields with descriptions:

Extended Commands	Specifies whether additional commands are desired for more ping configuration parameters. Answer yes (**y**) or no (**n**).
Source Address	Specifies the IPv4 address to use as the source address in the ECHO_REQ (or interface) packets.
Data Pattern	Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ECHO_REQ packets.
Sweep Range of Sizes	Varies the sizes of the ECHO_REQ packets transmitted.
Sweep Min Size	Specifies the minimum size of the ECHO_REQ packet. Valid range is **0** to **1488**.
Sweep Max Size	Specifies the maximum size of the ECHO_REQ packet. Valid range is the sweep minimum size to **1448**.
Sweep Interval	Specifies the interval used to determine packet size when performing the sweep. Valid range is **1** to **1448**.
Verbose Output	Specifies an extended results output.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is an example of a successful **ping** command:

```
>ping
VRF Name [-default-]:
Target IP address:192.168.0.30
Repeat count [5]:5
Datagram Size [100]:100
Timeout in seconds [2]:2
Wait interval in milliseconds [100]:100
Extended Commands? [n]:n
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
      '*' = Request timed out, '-' = Destination host unreachable
      'x' = TTL expired in transit, 'e' = Unknown error

Sending 5, 100-byte ICMP Echos to 192.168.0.30, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

ping ethernet

Use the **ping ethernet** command to initiate a loopback message from one Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoint (MEP) to another MEP. These loopback messages are used to test the accessibility of the destination MEP. Variations of this command include:

ping ethernet <*target-mac-address* | *target-mep-id*>
ping ethernet <*target-mac-address* | *target-mep-id*> **count** <*number*>
ping ethernet <*target-mac-address* | *target-mep-id*> **data** <*pattern*>
ping ethernet <*target-mac-address* | *target-mep-id*> **domain** <*domain name*> **association** <*association name*>
ping ethernet <*target-mac-address* | *target-mep-id*> **domain none association** <*association name*>
ping ethernet <*target-mac-address* | *target-mep-id*> **drop-eligible**
ping ethernet <*target-mac-address* | *target-mep-id*> **interface** <*interface*>
ping ethernet <*target-mac-address* | *target-mep-id*> **mep** <*mep id*>
ping ethernet <*target-mac-address* | *target-mep-id*> **priority** <*priority*>
ping ethernet <*target-mac-address* | *target-mep-id*> **repeat** <*number*>
ping ethernet <*target-mac-address* | *target-mep-id*> **size** <*bytes*>
ping ethernet <*target-mac-address* | *target-mep-id*> **timeout** <*timeout*>
ping ethernet <*target-mac-address* | *target-mep-id*> **validate-data**
ping ethernet <*target-mac-address* | *target-mep-id*> **verbose**
ping ethernet <*target-mac-address* | *target-mep-id*> **wait** <*interval*>

After specifying the target for the loopback messages, the other parameters can be entered in any order.

Syntax Description

<*target-mac-address* | *target-mep-id*>	Specifies the destination for the loopback message. Medium access control (MAC) addresses are entered in the format **HH:HH:HH:HH:HH:HH**. Target MEP IDs are the unique numerical values identifying MEPs. MEP IDs range from **1** to **8191**.
count <*number*>	Optional. Specifies the number of loopback messages to send. Range is **1** to **1000000**.
data <*pattern*>	Optional. Specifies the pattern to be carried in the data time length value (TLV) of the loopback message. Pattern is up to four hexadecimal digits. Pattern range is **0** to **ffff**.
domain <*domain name*>	Optional. Specifies the maintenance domain to which the transmitting MEP belongs.
domain none	Optional. Specifies no maintenance domain.
association <*association name*>	Optional. Specifies the maintenance association to which the transmitting MEP belongs.

drop-eligible	Optional. Specifies the drop eligible bit value in the virtual local area network (VLAN) tag.
interface <*interface*>	Optional. Specifies the interface on which the transmitting MEP is configured. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.
mep <*mep id*>	Specifies the MEP ID of the transmitting MEP. MEP ID range is **1** to **8191**.
priority <*priority*>	Optional. Specifies the 802.1 priority bits that are sent in the loopback message. Range is **0** to **7**.
repeat <*number*>	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size <*bytes*>	Optional. Specifies the size of the loopback message. Size ranges from **1** to **60** bytes.
timeout <*timeout*>	Optional. Specifies the time that the MEP will wait for a response to the loopback message. Range is **0** to **60** seconds.
validate-data	Optional. Specifies whether or not the transmitting MEP validates the contents of the data TLV in the received loopback messages.
verbose	Optional. Specifies that the results are in detailed, rather than summary, format.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending loopback messages. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **count** value is set to **5**.

By default, the **data** pattern is set to **abcd**.

By default, the **drop-eligible** value is not set.

By default, the **interval** is set to **1000** milliseconds.

By default, the **priority** value is the priority specified in the MEP's configuration.

By default, the **size** value is set to **2** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **validate-data** parameter is disabled.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface and the **wait** and **repeat** parameters.

Functional Notes

The **ping ethernet** command can be issued from both the Basic and Enable modes.

If the MEP ID is used as the target, the remote MEP must exist in the MEP continuity check message (CCM) database (meaning the remote MEP is transmitting valid CCMs) so that the MEP ID can be translated to the MAC address before the loopback message is transmitted.

Both the **domain** <*domain name*> and **association** <*association name*> parameters are not required if the source MEP ID of the MEP is specified and unique through the AOS device.

If the domain and association of the transmitting MEP are specified, and there is only one MEP in that domain or association, or if there is only one MEP configured on the unit, the **mep** <*mep id*> parameter is not required.

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

This command will not appear in the command line interface (CLI) unless Ethernet OAM CFM is enabled. To enable Ethernet OAM CFM, refer to the command ethernet cfm on page 1273.

Usage Examples

The following example initiates the Ethernet ping utility from an MEP in **Domain1** association **MA1** with a destination to an MEP with an MEP ID of **201**:

```
>ping ethernet 201 domain Domain1 association MA1
        Type CTRL+C to abort.
        Legend:    '!' = Success, '*' = Request timed out, 'd' = Data Mismatch
                   'o' = Out of order, '.' = No reply, 'e' = Unknown error.

        Sending 5, 100-byte LBRs to MEP 201 from MEP 1, timeout is 2 seconds:
        !!!!!
        Success rate is 100 percent (5/5), round-trip min/avg/max = 202/668/1011 ms
```

ping ipv6

Use the **ping ipv6** command (at the Basic mode prompt) to verify IPv6 network connectivity. For information on how to verify IPv4 network connectivity, refer to *ping on page 48*. Variations of this command include:

ping ipv6 <*ipv6 address*>
ping ipv6 <*ipv6 address*> <*interface*>
ping ipv6 <*ipv6 address*> **data** <*string*>
ping ipv6 <*ipv6 address*> **destination-option**
ping ipv6 <*ipv6 address*> **hop-by-hop-option**
ping ipv6 <*ipv6 address*> **repeat** <*number*>
ping ipv6 <*ipv6 address*> **size** <*value*>
ping ipv6 <*ipv6 address*> **source** <*ipv6 address*>
ping ipv6 <*ipv6 address*> **timeout** <*value*>
ping ipv6 <*ipv6 address*> **verbose**
ping ipv6 <*ipv6 address*> **wait** <*interval*>
ping ipv6 vrf <*name*> <*ipv6 address*>
ping ipv6 vrf <*name*> <*ipv6 address*> <*interface*>
ping ipv6 vrf <*name*> <*ipv6 address*> **data** <*string*>
ping ipv6 vrf <*name*> <*ipv6 address*> **destination-option**
ping ipv6 vrf <*name*> <*ipv6 address*> **hop-by-hop-option**
ping ipv6 vrf <*name*> <*ipv6 address*> **repeat** <*interval*>
ping ipv6 vrf <*name*> <*ipv6 address*> **size** <*value*>
ping ipv6 vrf <*name*> <*ipv6 address*> **source** <*ipv6 address*>
ping ipv6 vrf <*name*> <*ipv6 address*> **timeout** <*value*>
ping ipv6 vrf <*name*> <*ipv6 address*> **verbose**
ping ipv6 vrf <*name*> <*ipv6 address*> **wait** <*interval*>

*After specifying the target IPv6 address to ping, the other parameters can be entered in any order. Use the **?** after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

<*interface*>	Specifies the egress interface when pinging an IPv6 link-local address (any address that has the prefix **FE80::/64**). Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **ping ipv6** <*ipv6 address*> **?** to display a list of valid interfaces. This variable is mandatory when pinging a link-local address. This variable is ignored when using a non-link-local address.
<*ipv6 address*>	Specifies the IPv6 address of the system to ping. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **ping ipv6** command using a link-local destination address prompts the user for an egress interface.

data <*string*>	Optional. Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ICMPv6 ECHO_REQ packets.
destination-option	Optional. Includes the destination option in the ICMPv6 ECHO_REQ packets.
hop-by-hop-option	Optional. Includes the hop-by-hop option in the ICMPv6 ECHO_REQ packets. This typically causes intermediate routers to process switch the packets, potentially detecting switching issues in these devices.
repeat <*number*>	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size <*value*>	Optional. Specifies the datagram size (in bytes) of the ping packet. Valid range is **1** to **1448** bytes.
source <*ipv6 address*>	Optional. Specifies the IPv6 address to use as the source address in the ICMPv6 ECHO_REQ (or interface) packets. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **ping ipv6** command using a link-local destination address prompts the user for an egress interface. The source IPv6 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.
timeout <*value*>	Optional. Specifies the timeout period after which the ping is considered unsuccessful. Valid range is **1** to **60** seconds.
verbose	Optional. Enables detailed messaging.
vrf <*name*>	Optional. Specifies the VRF where the IPv6 address exists.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending test packets. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **data** pattern is set to **abcd**.

By default, the **repeat** is set to **5**.

By default, the **size** value is set to **100** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **wait** value is set to **100** milliseconds.

Command History

Release 18.1	Command was introduced.

Functional Notes

The **ping ipv6** command can be issued from both the Basic and Enable modes.

The **ping ipv6** command helps diagnose basic IPv6 network connectivity using the Packet Internet Groper program to repeatedly bounce Internet Control Message Protocol version 6 (ICMPv6) ECHO_REQ packets off a system (using a specified IPv6 address). AOS allows executing a standard **ping ipv6** request to a specified IPv6 address, or provides keywords to configure a more specific **ping ipv6** configuration.

The following is a list of output messages from the **ping ipv6** command:

!	Success
-	Destination Host Unreachable
$	Invalid Host Address
x	TTL Expired in Transit
?	Unknown Host
*	Request Timed out
e	Unknown Error
B	Packet too Big

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is example pings **2001:DB8:1A0::3** with **200** byte ICMPv6 ECHO_REQ packets:

>**ping ipv6 2001:DB8:1A0::3 size 200**
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
'*' = Request timed out, '-' = Destination host unreachable
'x' = TTL expired in transit, 'e' = Unknown error
'B' = Packet too big

Sending 5, 200-byte ICMP Echos to 2001:DB8:1A0::3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms

ping stack-member <*number*>

Use the **ping stack-member** command to ping a member of the stack. Variations of this command include:

ping stack-member <*number*>
ping stack-member <*number*> **vrf** <*name*>

Syntax Description

<*number*>	Specified which member of the stack to ping.
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) where the stack-member exists.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

The **ping stack-member** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example pings a member of the stack:

```
>ping stack-member 3
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
      '*' = Request timed out, '-' = Destination host unreachable
      'x' = TTL expired in transit
Sending 5, 100-byte ICMP Echos to 169.254.0.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 2/2.2/3 ms
#
```

ping twamp

Use the **ping twamp** command to execute a Two-Way Active Measurement Protocol (TWAMP) type ping to measure the packet loss, delay, and interpacket delay variation (IPDV) and display the results of the test. Use the subcommands in any combination, in any order, when specifying the destination site. Variations of this command include:

ping twamp
ping twamp <*ip address* | *hostname*>
ping twamp <*ip address* | *hostname*> **control-port** <*port*>
ping twamp <*ip address* | *hostname*> **data pattern**
ping twamp <*ip address* | *hostname*> **data pattern ascii** <*pattern*>
ping twamp <*ip address* | *hostname*> **data pattern hex** <*pattern*>
ping twamp <*ip address* | *hostname*> **data random**
ping twamp <*ip address* | *hostname*> **data zero**
ping twamp <*ip address* | *hostname*> **dscp** <*value*>
ping twamp <*ip address* | *hostname*> **interval** <*value*>
ping twamp <*ip address* | *hostname*> **port** <*port*>
ping twamp <*ip address* | *hostname*> **repeat** <*value*>
ping twamp <*ip address* | *hostname*> **size** <*value*>
ping twamp <*ip address* | *hostname*> **source** <*ip address*>
ping twamp <*ip address* | *hostname*> **source-port** <*port*>
ping twamp <*ip address* | *hostname*> **timeout** <*value*>
ping twamp <*ip address* | *hostname*> **verbose**
ping twamp <*ip address* | *hostname*> **wait** <*value*>
ping twamp vrf <*name*>
ping twamp vrf <*name*> <*ip address* | *hostname*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **control-port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern**
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern ascii** <*pattern*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern hex** <*pattern*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data random**
ping twamp vrf <*name*> <*ip address* | *hostname*> **data zero**
ping twamp vrf <*name*> <*ip address* | *hostname*> **dscp** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **interval** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **repeat** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **size** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **source** <*ip address*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **source-port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **timeout** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **verbose**

ping twamp vrf <*name*> <*ip address* | *hostname*> **wait** <*value*>

*The subcommands can be used in a string of any available combination. Use the **?** after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

<*ip address* | *hostname*>	Optional. Specifies the IP address or host name of the system to ping. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**). Entering the **ping twamp** command with no specified IP address prompts the user with parameters for a more detailed **ping twamp** configuration.
control-port <*port*>	Optional. Specifies the destination TWAMP control port. Port range is **1** to **65535**.
data	Optional. Specifies data used to pad packets. The following options are available:
pattern	Pads the packet with a user-specified pattern.
ascii <*pattern*>	Pads the packet with a user-specified ascii pattern.
hex <*pattern*>	Pads the packet with a user-specified hex pattern.
random	Pads the packet with random numbers.
zero	Pads the packet with all zeros.
dscp <*value*>	Optional. Specifies the differentiated services code point (DSCP) value. Valid range is **0** to **63**.
interval <*value*>	Optional. Specifies the interval between consecutive ping TWAMPs (in milliseconds). Valid range is **5** to **5000**.
port <*port*>	Optional. Specifies the destination port for the TWAMP test packets. Valid range is **1** to **65535**.
repeat <*value*>	Optional. Specifies the number of ping TWAMP packets. Valid range is **1** to **1000**.
size <*value*>	Optional. Specifies the datagram size. Valid range is **0** to **1462**.
source <*ip address*>	Optional. Specifies the source IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
source-port <*port*>	Optional. Specifies the source port for the TWAMP test packets. Valid range is **1** to **65535**.
timeout <*value*>	Optional. Specifies the timeout value in milliseconds. Valid range is **100** to **60000**.
verbose	Optional. Displays the detailed two-way ping verbose results for the specified IP address or host name.
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) instance within which the ping is executed. If no VRF is specified, the default (unnamed) VRF is used.

wait <*value*>	Optional. Specifies the interval (in milliseconds) between consecutive TWAMP test packets. Range is **5** to **5000**.

Default Values

By default, the **data** is **zero,** the **dscp** is **0**, the **interval** value is **20,** the **port** value is **0,** the repeat value is **100**, the **size** is **0**, and the **timeout** is **2000** milliseconds.

Command History

Release 17.4	Command was introduced to replace the **twping** command.
Release 17.6	Command was expanded to include **control-port** and **wait** keywords.
Release A4.01	Command was expanded to include the **ascii** and **hex** pattern parameters.
Release R11.2.0	Command was expanded to include the **vrf** parameter.

Functional Notes

The **ping twamp** command can be issued from both the Basic and Enable modes.

Usage Examples

The following example executes a TWAMP ping:

```
>ping twamp
2009.06.03 11:18:24 IP.TWPING CTRL EVNT Attempting to connect
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Init -> Opening (event=Open Connection)
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Opening -> Setup (event=RX
    Server-Greeting)
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Setup -> Starting (event=TX
    Setup-Response)
2009.06.03 11:18:24 IP.TWPING CTRL PKT Sending Setup-Response (len=140)
 mode=1
 keyId=00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
--MORE--
```

show clock

Use the **show clock** command to display the system time and date entered using the **clock set** command. Refer to *clock set <time> <day> <month> <year> on page 223* for more information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example displays the current time and data from the system clock:

```
>show clock
23:35:07 UTC Tue Aug 20 2002
```

show snmp

Use the **show snmp** command to display the system Simple Network Management Protocol (SNMP) parameters and current status of SNMP communications.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following is an example output using the **show snmp** command for a system with SNMP disabled and the default chassis and contact parameters:

```
>show snmp
Chassis: Chassis ID
Contact: Customer Service
0 Rx SNMP packets
  0 Bad community names
  0 Bad community uses
  0 Bad versions
  0 Silent drops
  0 Proxy drops
  0 ASN parse errors
```

show version

Use the **show version** command to display the current AOS version information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following is sample output from the **show version** command:

>**show version**

```
AOS version 06.01.00
 Checksum: 1F0D5243 built on Fri Nov 08 13:12:06 2002
 Upgrade key: de76efcfeb4c8eeb6901188475dd0917
Boot ROM version 03.00.18
 Checksum: 7A3D built on: Fri Nov 08 13:12:25 2002
Copyright (c) 1999-2002 Adtran Inc.
Serial number C14C6308

UNIT_2 uptime is 0 days 4 hours 59 minutes 43 seconds

System returned to ROM by Warm Start
Current system image file is "030018adv.biz"
Boot system image file is “030018adv.biz”
```

telnet *<ip address>*

Use the **telnet** command to open a Telnet session (through AOS) to another system on the network. Variations of this command include the following:

telnet *<ip address | hostname>*
telnet *<ip address | hostname>* **port** *<tcp port>*
telnet vrf *<name> <ip address | hostname>*
telnet vrf *<name> <ip address | hostname>* **port** *<tcp port>*

Syntax Description

<ip address | hostname>	Specifies the IP address or host name of the remote system. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**). IPv6 addresses should be expressed in colon hexadecimal format (X:X:X:X::X). For example, **2001:DB8:1::1**.
port *<tcp port>*	Optional. Specifies the Transmission Control Protocol (TCP) port number to be used when connecting to a host through Telnet. Range is **1** to **65535**.
vrf *<name>*	Optional. Specifies the virtual routing and forwarding (VRF) where the IP address or host name exists.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 14.1	Command was expanded to specify the port number.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example opens a Telnet session with a remote system (**10.200.4.15**):

>**telnet 10.200.4.15**
User Access Login:
Password:

The following example opens a Telnet session with a remote system (**10.200.4.15**) on port **8010**:

>**telnet 10.200.4.15 port 8010**
User Access Login:
Password:

traceroute

Use the **traceroute** command to display the Internet Protocol version 4 (IPv4) routes a packet takes to reach the specified destination. Variations of this command include:

traceroute
traceroute [ip] <*ipv4 address* | *hostname*>
traceroute [ip] <*ipv4 address* | *hostname*> <*interface*>
traceroute [ip] <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
traceroute [ip] <*ipv4 address* | *hostname*> <*interface*> **source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*> **source** <*ipv4 address*>

Syntax Description

ip	Optional. Specifies an IPv4 trace.
<*interface*>	Optional. Specifies the egress interface to use for the trace. Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **traceroute** <*ipv4 address* | *hostname*> **?** to display a list of valid interfaces.
<*ipv4 address* | *hostname*>	Optional. Specifies the IPv4 address or host name of the remote system's route to trace.
source <*ipv4 address*>	Optional. Specifies the IPv4 address of the interface to use as the source of the trace. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) where the route exists.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command was expanded to include the <*interface*> and **ip** parameters.

Functional Notes

The **traceroute** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **traceroute** command:

>**traceroute 192.168.0.1**
Type CTRL+C to abort.
Tracing route to 192.168.0.1 over a maximum of 30 hops
1 22ms 20ms 20ms 192.168.0.65
2 23ms 20ms 20ms 192.168.0.1

traceroute ethernet

Use the **traceroute ethernet** command to initiate a linktrace message from one Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoint (MEP) to another MEP. These linktrace messages are used to trace the packet route to a destination MEP. Variations of this command include:

traceroute ethernet <*target-mac-address* | *target-mep-id*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **domain** <*domain name*> **association** <*association name*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **domain none association** <*association name*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **fdb-only**
traceroute ethernet <*target-mac-address* | *target-mep-id*> **interface** <*interface*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **mep** <*mep id*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **sorted**
traceroute ethernet <*target-mac-address* | *target-mep-id*> **timeout** <*timeout*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **ttl** <*value*>

After specifying the target for the linktrace messages, the other parameters can be entered in any order.

Syntax Description

<*target-mac-address* | *target-mep-id*>	Specifies the destination for the linktrace message. Medium access control (MAC) addresses are entered in the format **HH:HH:HH:HH:HH:HH**. Target MEP IDs are the unique numerical values identifying MEPs. MEP IDs range from **1** to **8191**.
domain <*domain name*>	Optional. Specifies the maintenance domain to which the transmitting MEP belongs.
domain none	Optional. Specifies no maintenance domain.
association <*association name*>	Optional. Specifies the maintenance association to which the transmitting MEP belongs.
fdb-only	Optional. Specifies that the maintenance points on the route only use their forwarding database, and not their continuity check message (CCM) database when deciding if/how to forward linktrace messages.
interface <*interface*>	Optional. Specifies the interface on which the transmitting MEP is configured. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.

mep <*mep id*>	Optional. Specifies the MEP ID of the transmitting MEP. MEP ID range is **1** to **8191**.
sorted	Optional. Specifies the traceroute utility waits until all traceroute results have been received and sorted by hop count before displaying them.
timeout <*timeout*>	Optional. Specifies the time that the MEP will wait for a response to the linktrace message. Range is **0** to **60** seconds.
ttl <*value*>	Optional. Specifies the time to live (TTL) field of the linktrace message. Range is **0** to **255**.

Default Values

By default, the **timeout** value is set to **5** seconds.

By default, the **ttl** value is set to **5** seconds.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface and the Gigabit Switchport interface.

Functional Notes

The **traceroute ethernet** command can be issued from both the Basic and Enable modes.

If the MEP ID is used as the target, the remote MEP must exist in the MEP CCM database (meaning the remote MEP is transmitting valid CCMs) so that the MEP ID can be translated to the MAC address before the linktrace message is transmitted.

Both the **domain** <*domain name*> and **association** <*association name*> parameters are not required if the source MEP ID of the MEP is specified and unique through the AOS device.

If the domain and association of the transmitting MEP are specified, and there is only one MEP in that domain or association, or if there is only one MEP configured on the unit, the **mep** <*mep id*> parameter is not required.

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example initiates the Ethernet traceroute utility from a MEP with the ID **1** to an MEP with an MEP ID of **201**:

>**traceroute ethernet 201 mep 1**

```
Type CTRL+C to abort.

TTL 255. LTM Timeout is 5 seconds
Tracing route to        MEPID 201 (00:10:94:00:00:06)
                from    MEPID 1
                in      Domain_1/MA_1
MD Level 7, vlan 0
Traceroute sent via interface eth 0/1

-------------------------------------------------------------------------------------------------------------------------------
Hops    Mac                             Flags           Ingress-Action          Relay Action
          PrevHop                                               Egress-Action
-------------------------------------------------------------------------------------------------------------------------------
1       00:10:94:00:00:00               Forwarded       InNoTLV                 RLY_MPDB
            00:A0:C8:16:96:0D                                   EgOK
3       00:10:94:00:00:05               Forwarded       InNoTLV                 RLY_MPDB
            00:10:94:00:00:04                                   EgOK
2       00:10:94:00:00:04               Forwarded       InNoTLV                 RLY_MPDB
            00:10:94:00:00:00                                   EgOK
4       00:10:94:00:00:06 (Eg)          Terminal        InNoTLV                 RLY_HIT
            00:10:94:00:00:05

Destination reached
```

Remember that linktrace can be a tree-structure, and is not always linear. The PrevHop for Hop 3 in the previous example tells you the MAC of Hop 2. This gives you a way to trace the linktrace message when a tree-structure exists. Refer to Section J.5 of IEEE 802.1ag for more information.

traceroute ipv6

Use the **traceroute ipv6** command to display the IPv6 nodes traversed to reach the specified destination. Variations of this command include:

traceroute ipv6 *<ipv6 address>*
traceroute ipv6 *<ipv6 address> <interface>*
traceroute ipv6 *<ipv6 address> <interface>* **source** *<ipv6 address>*
traceroute ipv6 *<ipv6 address>* **source** *<ipv6 address>*
traceroute ipv6 vrf *<name> <ipv6 address>*
traceroute ipv6 vrf *<name> <ipv6 address> <interface>*
traceroute ipv6 vrf *<name> <ipv6 address> <interface>* **source** *<ipv6 address>*
traceroute ipv6 vrf *<name> <ipv6 address>* **source** *<ipv6 address>*

Syntax Description

<interface>	Optional. Specifies the egress interface when tracing a route to an IPv6 link-local address (any address that has the prefix **FE80::/64**). Interfaces are specified in the *<interface type> <slot/port* | *interface id>* format. For example, for an Ethernet interface, use **eth 0/1**. Type **traceroute ipv6** *<ipv6 address>* **?** to display a list of valid interfaces. This variable is ignored when using a non-link-local address.
<ipv6 address>	Specifies the IPv6 address of the remote system's route to trace. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **traceroute ipv6** command using a link-local destination address prompts the user for an egress interface.
source *<ipv6 address>*	Optional. Specifies the IPv6 address to use as the source address in the probing packets. The source IPv6 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.
vrf *<name>*	Optional. Specifies the VRF where the IPv6 address exists.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Functional Notes

The **traceroute ipv6** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS platforms supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **traceroute ipv6** command:

>**traceroute ipv6 2001:DB8:1A0::3**
Tracing route to over a maximum of 30 hops
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
'*' = Request timed out, '-' = Destination host unreachable
'x' = TTL expired in transit, 'e' = Unknown error
'B' = Packet too big

1	2ms	2ms	3ms	2001:DB8:0:F820::5
2	102ms	109ms	102ms	2001:DB8:1A0::3

COMMON COMMANDS

The following section contains descriptions of commands that are common across multiple command sets. These commands are listed in alphabetical order.

alias “*<text>*”

Use the **alias** command to populate the ifAlias object identifier (OID) (Interface Table MIB of RFC 2863) for all physical and virtual interfaces when using Simple Network Management Protocol (SNMP) management stations. Use the **no** form of this command to remove an alias.

Syntax Description

“*<text>*”	Describes the interface (for SNMP) using an alphanumeric character string enclosed in quotation marks (limited to 64 characters).

Default Values

No default values are necessary for this command.

Applicable Command Modes

Applies to all interface mode command sets.

Command History

Release 1.1	Command was introduced.

Functional Notes

The ifAlias OID is a member of the ifXEntry object-type (defined in RFC 2863) used to provide a nonvolatile, unique name for various interfaces. This name is preserved through power cycles. Enter a string (using the **alias** command) which clearly identifies the interface.

Usage Examples

The following example defines a unique character string for the T1 interface:

(config)**#interface t1 1/1**
(config-t1 1/1)**#alias “CIRCUIT_ID_23-908-8887-401”**

Technology Review

Please refer to RFC 2863 for more detailed information on the ifAlias display string.

cross-connect

Use the **cross-connect** command to create a cross-connection between a created interfaces, whether virtual or physical. Interface connection types include connecting time division multiplexing (TDM) groups on an interface to a virtual interface, or connecting Point-to-Point Protocol (PPP) interfaces to Frame Relay interfaces for use with PPP over Frame Relay (PPPoFR), or PPP interfaces to Ethernet interfaces for PPP over Ethernet (PPPoE) functionality. Variations of this command include:

cross-connect *<number> <from interface> <to interface>*
cross-connect *<number> <from interface> <group number> <to interface>*

*Changing **cross-connect** settings could potentially result in service interruption.*

Syntax Description

<number>	Identifies the cross connection using a number descriptor or label (useful in systems that allow multiple cross connections). Valid range is **1** to **1024**.
<from interface>	Specifies the interface (physical or virtual) on one end of the cross connection. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; and for an ATM subinterface, use **atm 1.1**. Type **cross-connect 1 ?** for a list of valid interfaces.
<group number>	Optional. Specifies which configured TDM group to use for this cross connection. This subcommand only applies to T1 physical interfaces.
<to interface>	Specifies the virtual interface on the other end of the cross connection. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; and for an ATM subinterface, use **atm 1.1**. Use the **?** to display a list of valid interfaces.

Default Values

By default, there are no configured cross connections.

Applicable Command Modes

Applies to all interface mode command sets.

Command History

Release 1.1	Command was introduced.
Release 5.1	Command was expanded to include the E1 interface.
Release 17.7	Command was expanded to include its use with the PPPoFR feature.

Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface.
Release R10.6.0	Command was expanded to include the Ethernet and Gigabit Ethernet interfaces.

Functional Notes

Cross connections provide the mechanism for connecting a configured virtual (Layer 2) endpoint with a physical (Layer 1) interface. Supported Layer 2 protocols include Frame Relay, PPP, and PPPoE. This command can be used to connect the Frame Relay interface with a TDM group on a T1 circuit, to connect a PPP interface to a Frame Relay interface for use with PPPoFR encapsulation, and to connect a PPP interface with an Ethernet, Gigabit Ethernet, or MEF Ethernet interface. When using the **cross-connect** command to connect a Frame Relay endpoint to a T1 interface, the command is issued from the Frame Relay Interface Configuration mode or from the Global Configuration mode. When using the **cross-connect** command to link a PPP interface to a Frame Relay interface in PPPoFR, the command is issued from the PPP Interface Configuration mode. When using the **cross-connect** command to connect a PPP interface with an Ethernet, Gigabit Ethernet, or MEF Ethernet interface, the command is issued from the PPP Interface Configuration mode.

Usage Examples

The following example creates a Frame Relay endpoint and connects it to the T1 1/1 physical interface:

1. Create the Frame Relay virtual endpoint and set the signaling method:
   (config)**#interface frame-relay 1**
   (config-fr 1)**#frame-relay lmi-type cisco**

2. Create the subinterface and configure the PVC parameters (including DLCI and IP address):
   (config-fr 1)**#interface fr 1.1**
   (config-fr 1.1)**#frame-relay interface-dlci 17**
   (config-fr 1.1)**#ip address 168.125.33.252 255.255.255.252**

3. Create the TDM group of 12 DS0s (64K) on the T1 physical interface:
   (THIS STEP IS ONLY VALID FOR T1 INTERFACES.)
   (config)**#interface t1 1/1**
   (config-t1 1/1)**#tdm-group 1 timeslots 1-12 speed 64**
   (config-t1 1/1)**#exit**

4. Connect the Frame Relay subinterface with port T1 1/1:
   (config)**#cross-connect 1 t1 1/1 1 fr 1**

The following example creates a PPP interface and connects it to the Frame Relay interface for use with PPPoFR. The Frame Relay interface in this example is based on the interface configured in the previous example.

1. Create the PPP interface and enter its configuration mode:
   (config)**#interface ppp 1**
   (config-ppp 1)#

2. Configure the PPP interface (including IP address and PPP authentication information):
   (config-ppp 1)**#ip address 65.162.109.202 255.255.255.252**
   (config-ppp 1)**#ppp authentication chap**

(config-ppp 1)**#ppp chap hostname USERNAME**
(config-ppp 1)**#ppp chap password PASSWORD**
(config-ppp 1)**#no shutdown**

3. Connect the PPP interface with the Frame Relay interface:
(config-ppp 1)**#cross-connect 2 fr 1.1 ppp 1**

Technology Review

Creating an endpoint that uses a Layer 2 protocol (such as Frame Relay) is generally a four-step process:

Step 1:
Create the Frame Relay virtual endpoint (using the **interface frame-relay** command) and set the signaling method (using the **frame-relay lmi-type** command). Also included in the Frame Relay virtual endpoint are all the applicable Frame Relay timers logging thresholds, encapsulation types, etc. Generally, most Frame Relay virtual interface parameters should be left at their default state. For example, the following creates a Frame Relay interface labeled **7** and sets the signaling method to **ansi**.

(config)**#interface frame-relay 7**
(config-fr 7)**#frame-relay lmi-type ansi**

Step 2:
Create the subinterface and configure the permanent virtual circuit (PVC) parameters. Using the subinterface, apply access policies to the interface, create bridging interfaces, configure dial-backup, assign an IP address, and set the PVC data link connection identifier (DLCI). For example, the following creates a Frame Relay subinterface labeled **22,** sets the DLCI to **30,** and assigns an IP address of **193.44.69.253** to the interface.

(config-fr 7)**#interface fr 7.22**
(config-fr 7.22)**#frame-relay interface-dlci 30**
(config-fr 7.22)**#ip address 193.44.69.253 255.255.255.252**

Step 3: (VALID ONLY FOR T1 INTERFACES)
Specify the group of DS0s used for signaling on the T1 interface by creating a TDM group. Group any number of contiguous DS0s together to create a data pipe for Layer 2 signaling. Also use the **tdm-group** command to specify the per-DS0 signaling rate on the interface. For example, the following creates a TDM group labeled **9** containing 20 DS0s (each DS0 having a data rate of 56 kbps).

(config)**#interface t1 1/1**
(config-t1 1/1)**#tdm-group 9 timeslots 1-20 speed 56**
(config-t1 1/1)**#exit**

Step 4:
Make the association between the Layer 2 endpoint and the physical interface using the **cross-connect** command. Supported Layer 2 protocols include Frame Relay and Point-to-Point Protocol (PPP). For example, the following creates a cross-connect (labeled **5**) to make an association between the Frame Relay virtual interface (**fr 7**) and the TDM group configured on interface t1 1/1 (**tdm-group 9**).

(config)**#cross-connect 5 t1 1/1 9 fr 7**

The **cross-connect** command is also used by the PPP interface when using PPPoFR or PPPoE. PPPoFR can be used with a single T1 circuit, when using Multilink PPP, or when using Multilink Frame Relay. Configuration considerations vary according to the type of PPPoFR being used. For more information regarding PPPoFR, refer to the *PPPoFR Configuration Guide*. For more information regarding PPPoE, refer to the *Configuring the EFM NIM2 and the MEF Ethernet Interface* configuration guide. Both guides are available online at https://supportcommunity.adtran.com.

description *<text>*

Use the **description** command to identify the specified interface (for example, circuit ID, contact information, etc.). Use the **no** form of this command to remove a description.

Syntax Description

<text>	Identifies the specified interface using up to 80 alphanumeric characters.

Default Values

No default values are necessary for this command.

Applicable Command Modes

Applies to all interface mode command sets.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example enters comment information using the **description** command:

(config)**#interface t1 1/1**
(config-t1 1/1)**#description This is the Dallas office T1**

do

Use the **do** command to execute any AOS command, regardless of the active configuration mode. It provides a way to execute commands in other modes without taking the time to exit the current mode and enter the desired one.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Applicable Command Modes

Applies to all mode command sets.

Command History

Release 2.1	Command was introduced.

Functional Notes

Use the **do** command to view configurations or interface states after configuration changes are made without exiting to the Enable mode.

Usage Examples

The following example shows the **do** command used to view the Frame Relay interface configuration while currently in the T1 Interface Configuration mode:

```
(config)#interface t1 1/1
(config-t1 1/1)#do show interfaces fr 7
fr 7 is ACTIVE
  Signaling type is ANSI signaling role is USER
  Polling interval is 10 seconds full inquiry interval is 6 polling intervals
Output queue: 0/0 (highest/drops)
    0 packets input 0 bytes
    0 pkts discarded 0 error pkts 0 unknown protocol pkts
    0 packets output 0 bytes
    0 tx pkts discarded 0 tx error pkts
```

end

Use the **end** command to exit the current configuration mode and enter the Enable Security mode.

*When exiting the Global Configuration mode, remember to perform a **copy running-config startup-config** to save all configuration changes.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Applicable Command Modes

Applies to all mode command sets except Basic mode.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example shows the **end** command being executed in the T1 Interface Configuration mode:

```
(config-t1 1/1)#end
#
```

#- Enable Security mode command prompt

exit

Use the **exit** command to exit the current configuration mode and enter the previous one. For example, using the **exit** command in an interface configuration mode will activate the Global Configuration mode. When using the **exit** command in the Basic mode, the current session will be terminated.

*When exiting the Global Configuration mode, remember to perform a **copy running-config startup-config** to save all configuration changes.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Applicable Command Modes

Applies to all mode command sets.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example shows the **exit** command being executed in the Global Configuration mode:

```
(config)#exit
#
```

#- Enable Security mode command prompt

interface

Use the **interface** command to activate the interface command set for the specified physical or virtual interface on an AOS unit. This command can be issued from the Global Configuration mode prompt or from any configuration mode to navigate to an interface configuration mode without issuing the **exit** command. The **interface** command is also used to create virtual interfaces prior to entering the configuration command set.

Type **interface ?** for a complete list of valid interface types on the unit. Refer to the command *interface range <interface type> <slot/port> - <slot/port> on page 1341* for more information. Use the **no** form of this command to delete a configured interface. Variations of this command include:

interface adsl <*slot/port*>
interface atm <*port* | *port.sublink*>
interface bri <*slot/port*>
interface bvi <*interface id*>
interface cellular <*slot/port*>
interface dds <*slot/port*>
interface demand <*interface id*>
interface demand <*interface id*> **encapsulation** [**hdlc** | **ppp**]
interface dot11ap <*ap* | *ap/radio* | *ap/radio.vap*> [**ap-type nv150** | **ap-type nv16x**] [**radio-type** [**802.11a** | **802.11bg**]]
interface e1 <*slot/port*>
interface ethernet <*slot/port* | *slot/port.subinterface*>
interface fdl <*slot/port*>
interface frame-relay <*port* | *port.sublink*>
interface fxo <*slot/port*>
interface fxs <*slot/port*>
interface gigabit-ethernet <*slot/port*>
interface gigabit-switchport <*slot/port*>
interface hdlc <*interface id*>
interface hssi <*slot/port*>
interface loopback <*interface id*>
interface mef-ethernet <*slot/port* | *slot/port.subinterface*>
interface modem <*slot/port*>
interface port-channel <*interface id*>
interface ppp <*interface id*>
interface pri <*slot/port*>
interface serial <*slot/port*>
interface sdsl <*slot/port*>
interface shdsl <*slot/port*>
interface switchport <*slot/port*>
interface t1 <*slot/port*>
interface t3 <*slot/port*>
interface t4 <*slot/port*>
interface tunnel <*interface id*> [**gre ip** | **multipoint-gre ip** | **vxlan**]
interface vdsl <*slot/port*>

interface vlan <*interface id*>
interface xgigabit-switchport <*slot/port*>

Syntax Description

adsl <*slot/port*>	Identifies physical asymmetric digital subscriber line (ADSL) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface adsl ?** for information regarding valid ranges.
atm <*port* | *port.sublink*>	Identifies and creates asynchronous transfer mode (ATM) virtual interfaces or subinterfaces. Port number range is **1** to **1024**. Sublink number range is **1** to **65535**.
bri <*slot/port*>	Identifies physical basic rate interfaces (BRIs). Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface bri ?** for information regarding valid ranges.
bvi <*interface id*>	Identifies bridged virtual interfaces (BVIs). This ID must correspond to an existing bridge group. Valid range is **1** to **255**.
cellular <*slot/port*>	Identifies physical cellular interfaces. Slot numbers are either 0 or 1. Port numbers begin at 1 with a range dependent on the unit.
dds <*slot/port*>	Identifies physical digital data service (DDS) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface dds ?** for information regarding valid ranges.
demand <*interface id*>	Identifies and creates virtual demand routing interfaces. Valid range is **1** to **1024**.
encapsulation [**hdlc** | **ppp**]	Optional. Specifies the encapsulation type for the demand routing interface. The **hdlc** encapsulation type specifies high level data link control (HDLC) encapsulation, and the **ppp** encapsulation type specifies Point-to-Point Protocol (PPP) encapsulation. If no encapsulation type is specified, PPP encapsulation is used for the demand routing interface by default.
dot11ap <*ap* | *ap/radio* | *ap/radio.vap*>	Identifies wireless access point, radio, and/or virtual access point (VAP) interfaces. The AP number range is **1** to **8**. The radio is either 1 or 2. The VAP number range is **1** to **8**.
ap-type nv150	Specifies the wireless access point (AP) type as a NetVanta 150.
ap-type nv16x	Specifies the wireless AP type as a NetVanta 160 Series.
radio-type [**802.11a** | **802.11bg**]	Specifies the radio interface type. Valid interface types are **802.11a** and **802.11bg**.
e1 <*slot/port*>	Identifies physical E1 interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface e1 ?** for information regarding valid ranges.
ethernet <*slot/port*>	Identifies physical Ethernet interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface ethernet ?** for information regarding valid ranges.

fdl <*slot/port*>	Identifies physical facility data link (FDL) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface fdl ?** for information regarding valid ranges.
frame-relay <*port* | *port.sublink*>	Identifies and creates virtual Frame Relay interfaces. Port number range is **1** to **1024**. Sublink range is **1** to **1007**.
fxo <*slot/port*>	Identifies physical foreign exchange office (FXO) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface fxo ?** for information regarding valid ranges.
fxs <*slot/port*>	Identifies physical foreign exchange station (FXS) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface fxs ?** for information regarding valid ranges.
gigabit-ethernet <*slot/port*>	Identifies physical gigabit Ethernet interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface gigabit-ethernet ?** for information regarding valid ranges.
gigabit-switchport <*slot/port*>	Identifies physical gigabit switchport interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface gigabit-switchport ?** for information regarding valid ranges.
hdlc <*interface id*>	Identifies and creates virtual high level data link control (HDLC) interfaces. Valid range is **1** to **1024**.
hssi <*slot/port*>	Identifies physical high speed serial interfaces (HSSIs). Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface hssi ?** for information regarding valid ranges.
loopback <*interface id*>	Identifies and creates virtual loopback interfaces. Valid range is **1** to **1024**.
mef-ethernet <*slot/port*>	Identifies physical Metro Ethernet Forum (MEF) Metro Ethernet interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit.
modem <*slot/port*>	Identifies physical analog modem interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface modem ?** for information regarding valid ranges.
port-channel <*interface id*>	Creates and configures virtual link aggregation interfaces. Valid range is **1** to **6**.
ppp <*interface id*>	Identifies and creates virtual Point-to-Point Protocol (PPP) interfaces. Valid range is **1** to **1024**.
pri <*slot/port*>	Identifies physical primary rate interfaces (PRIs). Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface pri ?** for information regarding valid ranges.

serial <*slot/port*>	Identifies physical serial ports. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface serial ?** for information regarding valid ranges.
sdsl <*slot/port*>	Identifies physical symetric digital subscriber line (SDSL) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface sdsl ?** for information regarding valid ranges.
shdsl <*slot/port*>	Identifies physical single-pair high-speed digital subscriber line (SHDSL) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface shdsl ?** for information regarding valid ranges.
switchport <*slot/port*>	Identifies physical switchport interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface switchport ?** for information regarding valid ranges.
t1 <*slot/port*>	Identifies physical T1 interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface t1 ?** for information regarding valid ranges.
t3 <*slot/port*>	Identifies physical T3 interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface t3 ?** for information regarding valid ranges.
t4 <*slot/port*>	Identifies physical T4 interface. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface t4 ?** for information regarding valid ranges.
ttunnel <*interface id*>	Identifies the tunnel interface ID. Valid range is **1** to **1024**.
gre ip	Creates a virtual Internet Protocol version 4 (IPv4) generic routing encapsulation (GRE) tunnel interface.
multipoint-gre ip	Creates a virtual IPv4 GRE multipoint tunnel interface.
vxlan	Creates a virtual extensible local area network (VxLAN) tunnel interface.
vdsl <*slot/port*>	Identifies physical very high-speed digital subscriber line (VDSL) interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface vdsl ?** for information regarding valid ranges.
vlan <*interface id*>	Identifies and creates virtual local area network (VLAN) interfaces. Valid range is **1** to **4094**.
xgigabit-switchport <*slot/port*>	Identifies physical 10-gigabit switchport interfaces. Slot and port number ranges are dependent upon the hardware installed in the unit. Type **interface xgigabit-switchport ?** for information regarding valid ranges.

Default Values

By default, an interface is inactive. To activate the interface, enter the **no shutdown** command from within the specific interface command set; for example, (config-ppp 7)**#no shutdown**. There are no default values for these commands.

Command History

Release 1.1	Command was introduced.
Release 3.1	Command was expanded to include the loopback interface.
Release 8.1	Command was expanded to include the ATM interface.
Release 9.1	Command was expanded to include the HDLC interface.
Release 11.1	Command was expanded to include demand, FXO, and PRI interfaces.
Release 15.1	Command was expanded to allow navigation from one interface to another without exiting the current configuration mode. Also, expanded to include AP, radio, VAP, and BVI interfaces.
Release 17.2	Command was expanded to include cellular interface.
Release A4.01	Command was expanded to include the MEF Metro Ethernet interface.
Release 18.1	Command was expanded to include the **ap-type** and **radio-type** parameters.
Release R10.1.0	The **tunnel** <*interface id*> command was changed to **tunnel** <*interface id*> **gre ip**.
Release R10.4.0	Command was expanded to include the NetVanta 160 Series AP type (**ap-type nv16x**).
Release R10.8.0	Command was expanded to include the **encapsulation** [**hdlc** | **ppp**] parameter on the demand routing interface.
Release R10.10.0	Command was expanded to include the SDSL, VDSL, and 10 gigabit switchport interfaces.
Release R10.11.0	Command was expanded to include the T4 interface.
Release R13.1.0	The **tunnel** <*interface id*> command was expanded to include **vxlan** parameter.

Functional Notes

When identifying a physical interface slot and port, keep the following in mind:

- Built-in nonremovable interfaces are identified by slot 0.
- Removable interfaces are identified by the physical labels on the slots.
- Interfaces are numbered per slot, from left to right, starting with 1.

Usage Examples

The following example uses the **interface** command to navigate from the T1 Interface Configuration mode to a Frame Relay interface:

(config)**#interface t1 1/1**
(config-t1 1/1)**#interface fr 7**
(config-fr 7)#

The following examples activate the interface configuration mode for the specified interface type:

For an ADSL interface:

(config)**#interface adsl 1/1**
(config-adsl 1/1)#

For an ATM subinterface:

(config)**#interface atm 1.1**
(config-atm 1.1)#

For a BRI interface:

(config)**#interface bri 1/2**
(config-bri 1/2)#

For a BVI interface:

(config)**#bridge irb**
(config)**#interface bvi 1**
(config-bvi 1)#

For a cellular interface:

(config)**#interface cellular 1/1**
(config-cellular 1/1)#

For a DDS interface:

(config)**#interface dds 1/1**
(config-dds 1/1)#

For a demand routing interface using HDLC encapsulation:
(config)**#interface demand 1 encapsulation hdlc**
(config-demand 1)#

For a dot11ap interface:

(config)**#interface dot11ap 1**
(config-dot11ap 1)#

For an E1 interface:

(config)**#interface e1 1**
(config-e1 1)#

For an Ethernet interface:

(config)**#interface ethernet 0/1**
(config-eth 0/1)#

For an Ethernet subinterface:

(config)**#interface eth 0/1.1**
(config-eth 0/1.1)#

For an FDL interface:

(config)**#interface fdl 1/1**
(config-fdl 1/1)#

For a Frame Relay subinterface:

(config)**#interface frame-relay 1.16**
(config-fr 1.16)#

For an FXO interface:

(config)**#interface fxo 0/1**
(config-fxo 0/1)#

For an FXS interface:

(config)**#interface fxs 2/1**
(config-fxs 2/1)#

For a Gigabit Ethernet interface:

(config)**#interface gigabit-ethernet 0/3**
(config-giga-eth 0/3)#

For an HDLC interface:

(config)**#interface hdlc 1**
(config-hdlc 1)#

For an HSSI interface:

(config)**#interface hssi 1/1**
(config-hssi 1/1)#

For a loopback interface:

(config)**#interface loopback 8**
(config-loop 8)#

For an MEF Ethernet interface:

(config)**#interface mef-ethernet 2/1**
(config-mef-ethernet 2/1)#

For a modem interface:

(config)**#interface modem 1/1**
(config-modem 1/1)#

For a port channel interface:

(config)**#interface port-channel 6**
Creating Port Channel interface 6.
(config-p-chan6)#

For a PPP interface:

(config)**#interface ppp 100**
(config-ppp 100)#

For a PRI interface:

(config)**#interface pri 2**
(config-pri 2)#

For a serial interface:

(config)**#interface serial 1/1**
(config-serial 1/1)#

For an SDSL interface:

(config)**#interface sdsl 1/1**
(config-sdsl 1/1)#

For an SHDSL interface:

(config)**#interface shdsl 1/1**
(config-shdsl 1/1)#

For a switchport interface:

(config)**#interface switchport 0/2**
(config-swx 0/2)#

For a 10 gigabit switchport interface:

(config)**#interface xgigabit-switchport 1/1**
(config-xgiga-swx 1/1)#

For a T1 interface:

(config)**#interface t1 1/1**
(config-t1 1/1)**#**

For a T3 interface:

(config)**#interface t3 1/1**
(config-t3 1/1)**#**

For a T4 interface:

(config)**#interface t4 1/1**
(config-t4 1/1)**#**

For a tunnel interface:

(config)**#interface tunnel 300 gre ip**
(config-tunnel 300)**#**

For a VDSL interface:

(config)**#interface vdsl 1/1**
(config-vdsl 1/1)**#**

For a VLAN interface:

(config)**#interface vlan 300**
(config-vlan 300)**#**

For a wireless access point:

(config)**#interface dot11ap 1/1.1**
(config-dot11ap 1/1.1-bg)**#**

shutdown

Use the **shutdown** command to disable an interface (both physical and virtual) or an Adtran Operating System (AOS) feature. Use the **no** form of this command to turn on the interface or enable the feature.

Syntax Description

No subcommands.

Default Values

By default, all interfaces are disabled.

The default setting for feature commands vary. Refer to the individual feature command set for specific details about feature default settings.

Command History

Release 1.1	Command was introduced.

Functional Notes

The **shutdown** command applies to all interface mode command sets and certain feature command sets.

When the **shutdown** command is issued from within an interface configuration command set, it disables the interface so no traffic will be passed through. When the **shutdown** command is issued from within a feature command set, it disables the feature and causes it to stop functioning. Using this command allows you to temporarily disable an interface or feature without altering the configurationg settings related to it. Once the **no shutdown** command is issued, the interface or feature is enabled, resuming functionality using the previously configured settings.

Usage Examples

The following example administratively disables the modem interface:

(config)**#interface modem 1/2**
(config-modem 1/2)**#shutdown**

The following example disables the packet capture feature:

(config)**#packet-capture 1CAPTURE standard**
(config-packet-capture-1CAPTURE)**#shutdown**

ENABLE MODE COMMAND SET

To activate the Enable mode, enter the **enable** command at the Basic mode prompt. (If an enable password has been configured, a password prompt will display.) For example:

```
>enable
Password: XXXXXXX
#
```

In AOS Release 17.1, output modifiers were introduced for all **show** commands. These modifiers help specify the information displayed in the **show** command output. The modifiers are appended to the end of the **show** command, preceded by the pipe character (|), and followed by the *<text>* to **exclude**, **include**, or with which to **begin** the display. The following output modifiers are common for all **show** commands:

| begin *<text>*	Produces output that begins with lines, including the specified text and every line thereafter.
| exclude *<text>*	Produces output that excludes any lines containing the specified text.
| include *<text>*	Produces output that only displays lines with the specified text.

In the following example, the **show** command was modified to **begin** its display with the lines **http server** and display all lines thereafter:

```
#show run | begin ip http server
no http server
no http secure-server
no snmp agent
no ip ftp server
ip ftp server default-filesystem flash
no ip scp server
no ip sntp server
!
```

In the following example, the **exclude** modifier was used with the **show** command to exclude lines of text containing the words **no shutdown**:

```
#show run interface ppp 1 | exclude no shutdown
!
!
interface ppp 1
ip address 10.2.0.1 255.255.255.0
ip access-policy UNTRUSTED
crypto map SITE2SITE
no lldp send-and-receive
cross-connect 1 t1 1/1 1 ppp 1
!
```

In the following example, the **include** modifier was used with the **show** command to only display information about interfaces:

```
#show run | include interface
interface switchport 0/1
interface switchport 0/2
interface switchport 0/3
interface switchport 0/4
interface switchport 0/5
interface switchport 0/6
interface switchport 0/7
--MORE--
```

The following command is common to multiple command sets and is covered in a centralized section of this guide. For more information, refer to the section listed below:

exit on page 83

All other commands for this command set are described in this section in alphabetical order.

application

Use the **application** command to enter the application command set. Ethernet Y.1731 and network synchronization (Network Sync) can be configured from this set. Available Ethernet Y.1731 commands in the application set include:

ethernet y1731 meg char-string *<name> <level> <id>*
ethernet y1731 meg icc-umc *<name> <level> <id>*

Syntax Description

char-string *<name>*	Specifies a Y.1731 maintenance entity group (MEG) name using a character string format. Maximum length is **45** ASCII characters.
icc-umc *<name>*	Specifies a Y.1731 MEG name using the ITU-CarrierCode Unique MEG ID Code MEG (ICC-UMC) format. Maximum length is **13** ASCII characters.
<level>	Specifies the MEG level. Valid range is **0** to **7**.
<id>	Specifies the MEG ID. Valid range is **1** to **8191**.

Default Values

By default, no Y.1731 applications are configured. By default, no Network Sync applications are configured.

Command History

Release R10.10.0	Command was introduced.
Release R10.11.0	Command was expanded to include Network Sync configuration commands.

Functional Notes

The Y.1731 application is configured using the commands outlined in *Y.1731 Application Command Set on page 1997*.

The Network Sync application is configured using the commands outlined in *Network Sync Application Command Set on page 1992*.

Usage Examples

The following example access the application command set:

```
>enable
#application
(app)#
```

The following example accesses the Y.1731 application command set:

>**enable**
#application
(app)**#ethernet y1731 meg char-string MEG1 3 100**
(app-y1731 100)#

auto-config restart

Use the **auto-config restart** command to restart the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at *https://supportcommunity.adtran.com*.

> NOTE *To stop AOS automatic self-configuration once it has started, enter the **no auto-config** command from the Global Configuration Mode prompt. The AOS automatic self-configuration feature must be disabled before the **auto-config restart** command will start the process.*

Syntax Description

No subcommands.

Default Values

There is no default setting for this command.

Command History

Release 11.1	Command was introduced.
Release R10.5.0	Command was relocated to the Enable Mode from the Global Configuration Mode.

Usage Examples

The following command restarts the automatic configuration process:

```
>enable
#auto-config restart
```

boot config

Use the **boot config** command to modify system boot parameters by specifying the location and name of primary and secondary configuration files. Use the **no** form of this command to use the default startup configuration file. Variations of this command include:

boot config cflash <*primary filename*>
boot config cflash <*primary filename*> **cflash** <*secondary filename*>
boot config cflash <*primary filename*> **flash** <*secondary filename*>
boot config flash <*primary filename*>
boot config flash <*primary filename*> **cflash** <*secondary filename*>
boot config flash <*primary filename*> **flash** <*secondary filename*>

*The **cflash** parameter is only valid for units with CompactFlash® capabilities.*

Syntax Description

cflash	Specifies that the configuration file is located in CompactFlash memory.
flash	Specifies that the configuration file is located in flash memory.
<*primary filename*>	Specifies the name of the primary configuration file (file names are case sensitive).
<*secondary filename*>	Optional. Specifies the name of the backup configuration file.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced

Usage Examples

The following example specifies the file **myconfig.biz** (located in flash memory) as the primary system boot file:

>**enable**
(config)**#boot config flash myconfig.biz**

The following example specifies the file **myconfig.biz** (located in flash memory) as the primary system boot file and the file **mybackupconfig.biz** (located in CompactFlash memory) as the backup configuration file:

>**enable**
(config)**#boot config flash myconfig.biz cflash mybackupconfig.biz**

boot system

Use the **boot system** command to specify the system image loaded at startup. Variations of this command include:

boot system cflash <*primary filename*>
boot system cflash <*primary filename*> **verify**
boot system cflash <*primary filename*> **cflash** <*secondary filename*>
boot system cflash <*primary filename*> **cflash** <*secondary filename*> **verify**
boot system cflash <*primary filename*> **flash** <*secondary filename*>
boot system cflash <*primary filename*> **flash** <*secondary filename*> **verify**
boot system cflash <*primary filename*> **no-backup**
boot system cflash <*primary filename*> **no-backup verify**
boot system flash <*primary filename*>
boot system flash <*primary filename*> **verify**
boot system flash <*primary filename*> <*secondary filename*>
boot system flash <*primary filename*> <*secondary filename*> **verify**
boot system flash <*primary filename*> **cflash** <*secondary filename*>
boot system flash <*primary filename*> **cflash** <*secondary filename*> **verify**
boot system flash <*primary filename*> **flash** <*secondary filename*>
boot system flash <*primary filename*> **flash** <*secondary filename*> **verify**
boot system flash <*primary filename*> **no-backup**
boot system flash <*primary filename*> **no-backup verify**

*The **cflash** parameter is only valid for units with CompactFlash® capabilities.*

*For units without CompactFlash capabilities, the secondary media type does not need to be specified. Refer to the last example under **Usage Examples**.*

Syntax Description

cflash	Specifies the system image is located in CompactFlash memory.
flash	Specifies the system image is located in flash memory.
no-backup	Specifies that there is no backup image present.
<*primary filename*>	Specifies the file name of the image (file names are case sensitive). Image files should have a .biz extension.
<*secondary filename*>	Specifies a name for the backup image.
verify	Optional. Verifies the image checksum.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.
Release R12.1.0	Command version **boot system flash** was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

Detailed instructions for upgrading AOS and loading files into flash memory are found online at http://supportforums.adtran.com.

The **boot system flash** command is not available in vAOS instances.

Usage Examples

The following example specifies **myimage.biz** (located in CompactFlash memory) as the primary image file with no backup image:

```
>enable
#boot system cflash myimage.biz no-backup
```

The following example specifies **myimage.biz** (located in flash memory) as the primary image file with no backup image:

```
>enable
#boot system flash myimage.biz no-backup
```

The following example specifies **myimage.biz** (located in flash memory) as the primary image file and **mybackupimage.biz** (also located in flash memory) as the backup image:

```
>enable
#boot system flash myimage.biz mybackupimage.biz
```

clear activchassis

Use the **clear activchassis** command to cause the master device to trigger a restart of the ActivChassis supervision protocols. This action causes the entire ActivChassis to restart discovery and to re-resolve the current ActivChassis configuration.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.

Usage Examples

The following example restarts the ActivChassis supervision protocols:

```
>enable
#clear activchassis
```

clear arp-cache

Use the **clear arp-cache** command to remove all dynamic entries from the Address Resolution Protocol (ARP) cache table. Variations of this command include:

clear arp-cache
clear arp-cache vrf <*name*>

Syntax Description

vrf <*name*>	Optional. Clears the ARP cache entry for a specific virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release A1	Command was expanded to include the **vrf** parameter.

Usage Examples

The following example removes all dynamic entries from the ARP cache:

>**enable**
#clear arp-cache

clear arp-entry <*ip address*>

Use the **clear arp-entry** command to remove a single entry from the Address Resolution Protocol (ARP) cache. Variations of this command include:

clear arp-entry <*ip address*>
clear arp-entry <*ip address*> **vrf** <*name*>

Syntax Description

<*ip address*>	Specifies a valid IP address to remove. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
vrf <*name*>	Optional. Clears the ARP entry for a specific virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release A1	Command was expanded to include the **vrf** parameter.

Usage Examples

The following example removes the entry for 10.10.10.1 from the ARP cache:

>**enable**
#clear arp-entry 10.10.10.1

clear bgp

Use the **clear bgp** command to clear information for Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) Border Gateway Protocol (BGP). You can clear BGP neighbors, BGP IPv4 and IPv6 route information, and BGP connections on the default or nondefault virtual routing and forwarding (VRF) instances. Variations of this command include:

clear bgp * [mef-ethernet <*slot/port*> **| system-control-evc** | **system-management-evc]**
clear bgp <*number*> **[system-control-evc** | **system-management-evc]**
clear bgp <*ipv4 address*> **[system-control-evc** | **system-management-evc]**
clear bgp <*ipv6 address*> **[system-control-evc** | **system-management-evc]**
clear bgp any-vrf [* | <*number*> **|** <*ipv4 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in | out | soft]**
clear bgp any-vrf [* | <*number*> | <*ipv6 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp any-vrf ipv4 [* | <*number*> | <*ipv4 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp any-vrf ipv6 [* | <*number*> | <*ipv6 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp ipv4 [* | <*number*> | <*ipv4 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp ipv6 [* | <*number*> | <*ipv6 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp vrf <*name*> **[*** | <*number*> | <*ipv4 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp vrf <*name*> **ipv4 [*** | <*number*> | <*ipv4 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**
clear bgp vrf <*name*> **ipv6 [*** | <*number*> | <*ipv6 address*>**] [mef-ethernet** <*slot/port*> **| system-control-evc** | **system-management-evc] [in** | **out** | **soft]**

Syntax Description

*****	Clears all BGP neighbors.
<*number*>	Clears all BGP neighbors with the specified autonomous system (AS) number. Range is **1** to **4294967295**.
<*ipv4 address*>	Clears the BGP neighbor with the specified IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<*ipv6 address*>	Clears the BGP neighbor with the specified IPv6 address. IPv6 addresses should be expressed in colon hexadecimal format (for example, **2001:DB8:1::1**).
any-vrf	Optional. Clears BGP connections for all VRF instances.
ipv4	Optional. Clears all BGP IPv4 route information.
ipv6	Optional. Clears all BGP IPv6 route information.
in	Causes a *soft* reset inbound with a neighbor, reprocessing routes advertised by that neighbor.

out	Causes a *soft* reset outbound with a neighbor, resending advertised routes to that neighbor.
soft	Causes a *soft* reset both inbound and outbound.
mef-ethernet <*slot/port*>	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.
vrf <*name*>	Optional. Clears connections for a nondefault VRF instance.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 18.1	Command was altered to support 4-byte AS number (previously AOS only supported 2-byte numbers).
Release 18.3	Command syntax was changed to remove the **ip** keyword for Adtran internetworking products. In addition, the **any-vrf**, **vrf** <*name*>, and **ipv4** parameters were added.
Release R10.1.0	Command was expanded to include IPv6 BGP capability, and the **ipv6** and <*ipv6 address*> parameters were added. In addition, the command syntax was changed to remove the **ip** keyword for Adtran voice products.
Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

The **clear bgp** command must be issued to re-initialize the BGP process between the peers matching the given arguments. Most neighbor changes, including changes to prefix-list filters, do not take effect until the **clear** command is issued. A hard reset clears the Transmission Control Protocol (TCP) connection with the specified peers, which results in clearing the table. This method of clearing is disruptive and causes peer routers to record a route flap for each route.

The **out** version of this command provides a soft reset out to occur by causing all routes to be re-sent to the specified peer(s). TCP connections are not torn down, so this method is less disruptive. Output filters/policies are re-applied before sending the update.

The **in** version of this command provides a soft reset in to occur by allowing the router to receive an updated table from a peer without tearing down the TCP connection. This method is less disruptive and does not count as a route flap. Currently, all of the peer's routes are stored permanently, even if they are filtered by a prefix list. The command causes the peer's routes to be reprocessed with any new parameters.

Usage Examples

The following example causes a hard reset with peers with an AS number of 101:

>**enable**
#clear bgp 101

clear bridge <*number*>

Use the **clear bridge** command to clear all counters associated with bridging (or for a specified bridge group). Variations of this command include:

clear bridge
clear bridge <*number*>

Syntax Description

<*number*>	Optional. Specifies a single bridge group. Range is **1** to **255**.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example clears all counters for bridge group 17:

>**enable**
#clear bridge 17

clear buffers max-used

Use the **clear buffers max-used** command to clear the maximum-used statistics for buffers displayed in the **show memory heap** command.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following example clears the maximum-used buffer statics:

```
>enable
#clear buffers max-used
```

clear counters *<interface>*

Use the **clear counters** command to clear the counters for a specified interface or Ethernet virtual connection (EVC). Variations of this command include:

clear counters evc *<name>*
clear counters *<interface>*

Syntax Description

evc *<name>*	Specifies an EVC on which to clear counters.
<interface>	Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear counters ?** or **show interfaces ?** for a complete list of interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface and the gigabit switchport interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release R10.5.0	Command was expanded to include the basic rate interface (BRI).
Release R11.2.0	Command was expanded to include the very high-speed digital subscriber line (VDSL).
Release R11.5.0	Command was expanded to include the EVC option.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example clears all counters associated with the Ethernet 0/1 interface:

>enable
#clear counters ethernet 0/1

clear counters crypto ipsec sa peak

Use the **clear counters crypto ipsec sa peak** command to clear peak Internet Protocol version 4 (IPv4) and Internet Protocol version 6 (IPv6) security association (SA) count statistics associated with IP security (IPsec).

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example clears the peak IPv4 and IPv6 SA count statistics:

```
>enable
#clear counters crypto ipsec sa peak
```

clear counters dynamic-counter

Use the **clear counters dynamic-counter** command to clear dynamic counter statistics. Variations of the command include:

clear counters dynamic-counter
clear counters dynamic-counter <*slot/index*>

Syntax Description

<*slot/index*>	Optional. Specifies the slot and port of the dynamic counter in the format <*slot/port*>. For example, **0/1**.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example clears all dynamic counter statistics:

>**enable**
#clear counters dynamic-counter

clear counters efm-group *<group number>*

Use the **clear counters efm-group** command to clear the counters of the specified Ethernet in the first mile (EFM) group.

Syntax Description

<group number>	Specifies the EFM group. Range is **1** to **1024**.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example clears the counters for the EFM group **1**:

```
>enable
#clear counters efm-group 1
```

clear counters ethernet cfm

Use the **clear counters ethernet cfm** command to clear all statistics held by Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoints (MEPs). Variations of this command include:

clear counters ethernet cfm
clear counters ethernet cfm domain <*domain name*> **association** <*association name*>
clear counters ethernet cfm domain none association <*association name*>
clear counters ethernet cfm interface <*interface*>
clear counters ethernet cfm level <*level*>
clear counters ethernet cfm mep-id <*mep id*>

Syntax Description

domain <*domain name*>	Optional. Specifies that only statistics for MEPs in the named domain are cleared.
domain none	Optional. Specifies that no domain is named and all MEP statistics, regardless of domain, are cleared.
association <*association name*>	Optional. Specifies that only statistics for MEPs in the named association are cleared.
interface <*interface*>	Optional. Specifies that only statistics for MEPs configured on the specified interface are cleared. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
level <*level*>	Optional. Specifies that only statistics for MEPs within the specified maintenance domain level are cleared. Level range is **0** to **7**.
mep-id <*mep id*>	Optional. Specifies that only statistics for MEPs with the specified MEP ID are cleared. MEP ID range is **1** to **8191**.

Default Values

No default values necessary for this command.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example clears all statistics associated with Ethernet OAM CFM MEPs:

>**enable**
#clear counters ethernet cfm

The following example clears all statistics associated with MEPs on maintenance domain level **5**:

>**enable**
#clear counters ethernet cfm level 5

clear counters global-policer

Use the **clear counters global-policer** command to clear the virtual AOS (vAOS) global policer statistics. This command clears the global policer dropped packets and dropped bytes counters. The licensed rate drops on each policed interface are also cleared.

Syntax Description

No additional subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R12.1.0	Command was introduced.

Usage Examples

The following example clears the vAOS global policer statistics:

```
>enable
#clear counters global-policer
```

clear counters hmr

Use the **clear counters hmr** command to clear any Session Initiation Protocol (SIP) header manipulation rules (HMR) statistics. Variations of this command include:

clear counters hmr
clear counters hmr direction inbound
clear counters hmr direction outbound
clear counters hmr policy <*name*>
clear counters hmr user <*extension*>
clear counters hmr user global
clear counters hmr user proxy-server
clear counters hmr user proxy-user

Syntax Description

direction inbound	Optional. Clears HMR statistics for inbound SIP traffic.
direction outbound	Optional. Clears HMR statistics for outbound SIP traffic.
policy <*name*>	Optional. Clears HMR statistics for a specific HMR policy.
user	Optional. Clears HMR statistics for a specific user.
<*extension*>	Optional. Clears HMR statistics for a specific user.
global	Optional. Clears HMR statistics for SIP global traffic.
proxy-server	Optional. Clears HMR statistics for SIP proxy server traffic.
proxy-user	Optional. Clears HMR statistics for SIP proxy user traffic.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example clears all HMR statistics:

>enable
#clear counters hmr

clear counters media-gateway

Use the **clear counters media-gateway** command to reset cumulative totals for all Realtime Transport Protocol (RTP) channels or for a specific RTP channel. Variations of this command include the following:

clear counters media-gateway
clear counters media-gateway channel <*value*>
clear counters media-gateway dtmf

Syntax Description

channel <*value*>	Optional. Specifies the ID of a particular media-gateway channel to be reset (for example, **0/1.1**).
dtmf	Optional. Specifies that dual tone multi-frequency (DTMF) counters are reset.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release A2	Command was expanded to include the **dtmf** parameter.

Usage Examples

The following example resets the counters on media gateway **channel 0/1.1**:

>**enable**
#clear counters media-gateway channel 0/1.1
Counters on media-gateway channel reset by console.

clear counters probe

Use the **clear counters probe** command to reset counters on all probe objects or on a specific probe. Variations of this command include:

clear counters probe
clear counters probe <*name*>

Syntax Description

<*name*>	Specifies a probe object to reset counter.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.

Usage Examples

The following example resets the counters for all configured probes:

>**enable**
#clear counters probe

The following example resets the counters only for the probe named **probe_A**:

>**enable**
#clear counters probe probe_A

clear counters shdsl <*slot/port*> splice-detect

Use the **clear counters shdsl splice-detect** command to clear all bad splice detection test data for the specified single-pair high-speed digital subscriber line (SHDSL) interface.

Syntax Description

<*slot/port*>	Specifies the slot and port of the interface for which you want to clear the test data.

Default Values

No default values are necessary for this command.

Command History

Release A4.05	Command was introduced.

Usage Examples

The following example clears all bad splice detection test data associated with the SHDSL 1/1 interface:

```
>enable
#clear counters shdsl 1/1 splice-detect
```

clear counters track

Use the **clear counters track** command to reset counters on all track objects or on a specifically named track.

clear counters track
clear counters track <*name*>

Syntax Description

<*name*>	Specifies a track object to reset counter.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.

Usage Examples

The following example resets the counters for all configured tracks:

>**enable**
#clear counters track

The following example resets the counters only for the track named **track_1**:

>**enable**
#clear counters track track_1

clear counters vlan *<vlan id>*

Use the **clear counters vlan** command to reset counters on the specified virtual local area network (VLAN) interface.

Syntax Description

<vlan id>	Specifies a valid VLAN interface ID. Range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example resets the counters on VLAN interface 7:

```
>enable
#clear counters vlan 7
```

clear counters voice-trunk

Use the **clear counters voice-trunk** command to reset counters on all voice trunks or on a specific voice trunk. Variations of this command include:

clear counters voice-trunk all
clear counters voice-trunk <*trunk id*>

Syntax Description

all	Clears all voice trunk counters.
<*trunk id*>	Specifies clearing a specific voice trunk using the trunk's two-digit identifier following T (for example, T01).

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.

Usage Examples

The following example resets the counters for all configured voice trunks:

>**enable**
#clear counters voice-trunk all

clear crypto ike sa

Use the **clear crypto ike sa** command to clear existing Internet key exchange (IKE) security associations (SAs). Use the **policy** and **remote-id** options to clear specific SAs without clearing them all. Variations of this command include:

clear crypto ike sa
clear crypto ike sa peak
clear crypto ike sa policy <*value*>
clear crypto ike sa remote-id <*remote id*>

Syntax Description

peak	Optional. Clears the peak IKE SA count reached.
policy <*value*>	Optional. Removes all IKE SAs associated with the specified policy priority value. This number is assigned using the command *crypto ike on page 1247*.
remote-id <*remote id*>	Optional. Removes all IKE SAs associated with the specified IKE remote ID. A delete payload is sent to the peers prior to deletion of the SA. This command is preferred to the **clear crypto ike sa policy** <*value*> command when multiple unique SAs have been created on the same IKE policy, but the user wants to delete only the SA to a unique peer.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 12.1	Command was expanded to include the **policy** and **remote-id** parameters.
Release 17.5	Command was expanded to include the **peak** parameter.

Usage Examples

The following example clears the entire database of IKE SAs (including the active associations):

>enable
#clear crypto ike sa

The following example clears IKE SAs associated with **policy 101**:

>enable
#clear crypto ike sa policy 101

The following example clears an IKE SA associated with **remote-id netvanta**:

>enable
#clear crypto ike sa remote-id netvanta

clear crypto ipsec sa

Use the **clear crypto ipsec sa** command to clear existing Internet Protocol security (IPsec) security associations (SAs), including active ones. Variations of this command include the following:

clear crypto ipsec sa
clear crypto ipsec sa entry <*ip address*> **ah** <*SPI*>
clear crypto ipsec sa entry <*ip address*> **esp** <*SPI*>
clear crypto ipsec sa map <*name*>
clear crypto ipsec sa peak
clear crypto ipsec sa peer <*ip address*>
clear crypto ipsec sa remote-id <*remote-id*>

Syntax Description

entry <*ip address*>	Optional. Clears only the SAs related to the specified destination IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
ah <*SPI*>	Optional. Clears only a portion of the SAs by specifying the Authentication Header (AH) Protocol and a security parameter index (SPI). You can determine the correct SPI value using the **show crypto ipsec sa** command.
esp <*SPI*>	Optional. Clears only a portion of the SAs by specifying the Encapsulating Security Payload (ESP) Protocol and an SPI. You can determine the correct SPI value using the **show crypto ipsec sa** command.
map <*name*>	Optional. Clears only the SAs associated with the specified crypto map.
peak	Optional. Clears the peak IPsec SA count reached.
peer <*ip address*>	Optional. Clears only the SAs associated with the specified far-end IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
remote-id <*remote-id*>	Optional. Removes all IPsec SAs associated with the specified IPsec remote ID.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 15.1	Command was expanded to include the **remote-id** parameter.
Release 17.5	Command was expanded to include the **peak** parameter.

Usage Examples

The following example clears all IPsec SAs:

>**enable**
#clear crypto ipsec sa

The following example clears the IPsec SA used for ESP traffic with the SPI of 300 to IP address **63.97.45.57**:

>**enable**
#clear crypto ipsec sa entry 63.97.45.57 esp 300

clear crypto keystore

Use the **clear crypto keystore** command to remove all stored cryptographic key pairs on a device and update the running configuration.

This command cannot be undone. Deleted key pairs cannot be recovered.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Functional Notes

The command prompts you to confirm before deleting the key pairs. You must enter either **yes** or **no** at the prompt. You will also be prompted to specify whether you want to save the system configuration, which will save the running configuration to the unit's nonvolatile random access memory (NVRAM). Even if you do not save the system configuration, the key pairs are still deleted from the device.

Usage Examples

The following example removes all stored cryptographic key pairs and saves the system configuration:

>**enable**
#clear crypto keystore
This will erase all stored key pairs. All self-generated and CA-signed
certificates will be deleted. This action is irreversible. Proceed? [yes/no] **yes**
All stored key pairs have been successfully deleted.
Associated certificates have been removed from the current system
configuration.
Save System Configuration? [y/n] **y**
Building configuration. . .
Done. Success!

clear desktop-auditing

Use the **clear desktop-auditing** command to remove the collected network access protection (NAP) statistics for clients connected to the network. Statistics can be cleared for a single client or for all clients. Variations of this command include:

clear desktop-auditing
clear desktop-auditing host <*hostname*>
clear desktop-auditing interface gigabit-switchport <*slot/port*>
clear desktop-auditing ip <*ip address*>
clear desktop-auditing mac <*mac address*>
clear desktop-auditing vlan <*vlan id*>

Syntax Description

host <*hostname*>	Optional. Clears the statistics for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Clears the statistics for the client using the specified interface.
ip <*ip address*>	Optional. Clears the statistics for the client with the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
mac <*mac address*>	Optional. Clears the statistics for the client with the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
vlan <*vlan id*>	Optional. Clears the statistics for the client with the specified virtual local area network (VLAN) identification number. VLAN IDs range from **1** to **4096**.

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.

Usage Examples

The following example clears all collected NAP statistics for all clients:

>**enable**
#clear desktop-auditing

The following example clears all collected NAP statistics for the client with the MAC address **00:A0:C8:00:00:01**:

>**enable**
#clear desktop-auditing mac 00:A0:C8:00:00:01

clear dot11 client *<mac address>*

Use the **clear dot11 client** command to disassociate with the client that has the specified medium access control (MAC) address.

Syntax Description

<mac address>	Specifies the MAC address of the client for which disassociation is desired. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release15.1	Command was introduced.

Usage Examples

The following example disassociates with a client with the MAC address 00:40:96:AB:38:5E:

```
>enable
#clear dot11 client 00:40:96:AB:38:5E

This Station has been removed.
```

clear dump-core

The **clear dump-core** command clears diagnostic information appended to the output of the **show version** command. This information results from an unexpected unit reboot.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.

Usage Examples

The following example clears the entire database of Internet key exchange (IKE) SAs (including the active associations):

```
>enable
#clear dump-core
```

clear ethernet cfm mep remote

Use the **clear ethernet cfm mep remote** command to clear remote maintenance endpoint (MEP) entries from the Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) continuity check message (CCM) database. Variations of this command include:

clear ethernet cfm mep remote
clear ethernet cfm mep remote domain <*domain name*> **association** <*association name*>
clear ethernet cfm mep remote domain none association <*association name*>
clear ethernet cfm mep remote mep-id <*mep id*>
clear ethernet cfm mep remote remote-mep <*mep id*>

Syntax Description

domain <*domain name*>	Optional. Specifies that only statistics for remote MEPs in the named domain are cleared.
domain none	Optional. Specifies that no domain is named and all remote MEP statistics, regardless of domain, are cleared.
association <*association name*>	Optional. Specifies that only statistics for remote MEPs in the named association are cleared.
mep-id <*mep id*>	Optional. Specifies that only statistics for local MEPs with the specified MEP ID are cleared. MEP ID range is **1** to **8191**.
remote mep-id <*mep id*>	Optional. Specifies that only statistics for remote MEPs with the specified MEP ID are cleared. MEP ID range is **1** to **8191**.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example clears all CCM entries for all remote MEPs:

```
>enable
#clear ethernet cfm mep remote
```

clear ethernet lmi statistics

Use the **clear ethernet lmi statistics** command to clear all Ethernet local management interface (E-LMI) statistics, or all E-LMI statistics for a specified interface. Variations of this command include:

clear ethernet lmi statistics
clear ethernet lmi statistics interface <*interface*>

Syntax Description

interface <*interface*>	Optional. Specifies an interface on which to clear E-LMI statistics. Specify interfaces in the format <*interface type [slot/port]*>. For example, for a Gigabit Ethernet interface, use **gigabit eth 0/1**. Type **clear ethernet lmi statistics ?** for a complete list of interfaces.

Default Values

No default values necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example clears all E-LMI statistics on all interfaces:

>enable
#clear ethernet lmi statistics

clear ethernet oam statistics

Use the **clear ethernet oam statistics** command to clear Ethernet Link operations, administration, and management (OAM) statistics on the interface. Ethernet Link OAM statistical information cleared includes Protocol Data Unit (PDU) counters, critical link fault records, and link-monitor events. Variations of this command include:

clear ethernet oam statistics
clear ethernet oam statistics interface <*interface*>

Syntax Description

interface <*interface*>	Optional. Clears the Ethernet Link OAM statistics only on the specified interface. If no interface is specified, then statistics on all interfaces with Ethernet Link OAM enabled are cleared. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id. subinterface id]>*. For example, for a Gigabit Ethernet interface, use **giga-eth 0/1**. For an Ethernet in the first mile (EFM) group, use **efm-group 1/1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

The following example clears all Ethernet Link OAM statistics for the Gigabit Ethernet interface **0/1**:

>enable
#clear ethernet oam statistics interface gigabit-ethernet 0/1

clear ethernet y1731 file-save

Use the **clear ethernet y1731 file-save** command to delete all Y.1731 performance monitoring log files and clears the current historical information stored in RAM.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.6.0	Command was introduced.

Usage Examples

The following example deletes all Y.1731 performance monitoring log files:

(config)**#clear ethernet y1731 file-save**

clear event-history

Use the **clear event-history** command to clear all messages logged to the local event-history.

*Messages cleared from the local event-history (using the **clear event-history** command) are no longer accessible.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example clears all local event-history messages:

```
>enable
#clear event-history
```

clear gvrp statistics

Use the **clear gvrp statistics** command to clear counter statistics on GARP VLAN Registration Protocol (GVRP) interfaces. Variations of this command include:

clear gvrp statistics all
clear gvrp statistics interface <*interface*>

Syntax Description

all	Clears the information for all GVRP interfaces.
interface <*interface*>	Clears the information for the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear gvrp statistics interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example clears counter statistics on the GVRP interfaces:

>**enable**
#clear gvrp statistics all

clear host

Use the **clear host** command to clear a host name when using the domain naming system (DNS) proxy. Variations of this command include:

clear host *
clear host <*hostname*>
clear host vrf <*name*> <*hostname*>

Syntax Description

*	Clears all hosts from the host table.
<*hostname*>	Clears a specific host entry from the host-to-address table.
vrf <*name*>	Optional. Clears the host table entry for a specific virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example clears all dynamic host names:

>**enable**
#clear host *

clear ip access-list

Use the **clear ip access-list** command to clear all counters associated with all Internet Protocol version 4 (IPv4) access control lists (ACLs) or a specified IPv4 ACL. Variations of this command include:

clear ip access-list
clear ip access-list *<ipv4 acl name>*

Syntax Description

<ipv4 acl name>	Optional. Specifies the name (label) of an IPv4 ACL to clear.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.9	Command was changed to require the **ip** keyword for Adtran internetworking products only.
Release R10.1.0	Command was changed to require the **ip** keyword for Adtran voice products.

Usage Examples

The following example clears all counters for the IPv4 ACL labeled **MatchAll**:

>**enable**
#clear ip access-list MatchAll

clear ip cache

Use the **clear ip cache** command to delete cache table entries. Add the **counters** parameter to reset the counters on the cache table. The command can be limited to a specific virtual routing and forwarding (VRF). Variations of this command include:

clear ip cache
clear ip cache counters
clear ip cache vrf <*name*>
clear ip cache vrf <*name*> **counters**

Syntax Description

counters	Optional. Resets counters in the cache table.
vrf <*name*>	Optional. Clears all fast-cache entries for a specific VRF.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 14.1	Command was expanded to include the **counters** parameter.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example removes all entries from the cache table:

>**enable**
#clear ip cache

The following example resets all fast-cache entries just for the VRF **RED**:

>**enable**
#clear ip cache vrf RED counters

clear ip crypto ipsec sa

Use the **clear ip crypto ipsec sa** command to clear existing Internet Protocol security (IPsec) security associations (SAs), including active ones. Variations of this command include the following:

clear ip crypto ipsec sa
clear ip crypto ipsec sa entry <*ip address*> **ah** <*SPI*>
clear ip crypto ipsec sa entry <*ip address*> **esp** <*SPI*>
clear ip crypto ipsec sa map <*name*>
clear ip crypto ipsec sa peak
clear ip crypto ipsec sa peer <*ip address*>
clear ip crypto ipsec sa profile <*name*>
clear ip crypto ipsec sa remote-id <*remote-id*>

Syntax Description

entry <*ip address*>	Optional. Clears only the SAs related to the specified destination IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
ah <*SPI*>	Optional. Clears only a portion of the SAs by specifying the Authentication Header (AH) Protocol and a security parameter index (SPI). You can determine the correct SPI value using the **show crypto ipsec sa** command.
esp <*SPI*>	Optional. Clears only a portion of the SAs by specifying the Encapsulating Security Payload (ESP) Protocol and an SPI. You can determine the correct SPI value using the **show crypto ipsec sa** command.
map <*name*>	Optional. Clears only the SAs associated with the specified crypto map.
peak	Optional. Clears the peak IPsec SA count reached.
peer <*ip address*>	Optional. Clears only the SAs associated with the specified far-end IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
profile <*name*>	Optional. Clears only the SAs created in association with the specified IPsec profile name.
remote-id <*remote-id*>	Optional. Removes all IPsec SAs associated with the specified IPsec remote ID.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 15.1	Command was expanded to include the **remote-id** parameter.
Release 17.5	Command was expanded to include the **peak** parameter.
Release R10.5.0	Command syntax was changed to require the **ip** keyword.
Release R11.9.0	Command was expanded to include the **profile** <*name*> parameter.

Usage Examples

The following example clears all IPsec SAs:

>**enable**
#clear ip crypto ipsec sa

The following example clears the IPsec SA used for ESP traffic with the SPI of **300** to IP address **63.97.45.57**:

>**enable**
#clear ip crypto ipsec sa entry 63.97.45.57 esp 300

clear ip dhcp binding

Use the **clear ip dhcp binding** command to clear Dynamic Host Configuration Protocol version 4 (DHCPv4) server binding entries. Variations of this command include:

clear ip dhcp binding *
clear ip dhcp binding <*ipv4 address*>
clear ip dhcp binding vrf <*name*> *
clear ip dhcp binding vrf <*name*> <*ipv4 address*>

Syntax Description

*****	Clears all automatic DHCPv4 server binding entries.
vrf <*name*>	Optional. Clears DHCPv4 server binding entries on the specified virtual routing and forwarding (VRF) instance.
<*ipv4 address*>	Clears a specific DHCPv4 server binding associated with an IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword for Adtran voice products.

Usage Examples

The following example clears all DHCPv4 server bindings on the default VRF:

```
>enable
#clear ip dhcp binding *
```

The following example clears all DHCPv4 server bindings from the VRF RED:

```
>enable
#clear ip dhcp binding vrf RED *
```

clear ip ffe

Use the **clear ip ffe** command to remove the RapidRoute Engine entries on all interfaces or on a specific interface. Variations of this command include:

clear ip ffe
clear ip ffe *<interface>*
clear ip ffe *<interface>* **peak**
clear ip ffe ipsec
clear ip ffe ipsec *<rapidroute interface ID>*
clear ip ffe ipsec *<rapidroute interface ID>* **peak**
clear ip ffe ipsec peak
clear ip ffe peak
clear ip ffe system-control-evc
clear ip ffe system-control-evc peak
clear ip ffe system-management-evc
clear ip ffe system-management-evc peak

Syntax Description

<interface>	Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**. Type **clear ip ffe?** for a complete list of valid interfaces.
ipsec	Specifies that all RapidRoute entries to and from an Internet Protocol security (IPsec) security association (SA) are cleared.
<rapidroute interface ID>	Specifies that RapidRoute entries to and from an IPsec SA on a specified RapidRoute interface are cleared. RapidRoute interface identifiers range from **1** to **16777215**.
peak	Clears the RapidRoute peak entry count. If no interface is specified, the peak entry counts for all interfaces are cleared.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.6	Command was expanded to include **ipsec** parameters.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group and Metro Ethernet Forum (MEF) Ethernet interface.
Release R11.10.0	Command was expanded to include the **peak** parameter.

Usage Examples

The following example clears all RapidRoute entries for the Ethernet 0/1 interface:

>**enable**
#clear ip ffe ethernet 0/1

The following example clears the RapidRoute peak entry count for all interfaces:

>**enable**
#clear ip ffe peak

clear ip flow stats

Use the **clear ip flow stats** command to clear all statistics associated with an integrated traffic monitoring (ITM) observation point.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example clears all ITM statistics associated with an observation point:

#clear ip flow stats

clear ip flow top-talkers

Use the **clear ip flow top-talkers** command to clear all statistics associated with integrated traffic monitoring (ITM) Top Talker listings.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.1	Command was introduced.

Usage Examples

The following example clears all Top Talker statistics:

#clear ip flow top-talkers

clear ip igmp group

Use the **clear ip igmp group** command to clear entries from the Internet Group Management Protocol (IGMP) tables. If no address or interface is specified, all nonstatic IGMP groups are cleared with this command. Variations of this command include:

clear ip igmp group
clear ip igmp group <*multicast address*>
clear ip igmp group <*interface*>

Syntax Description

<*multicast address*>	Optional. Clears the IGMP tables of a specific multicast group IP address. The multicast group IP address range is **244.0.0.0** to **239.255.255.255** or **224.0.0.0 /4**.
<*interface*>	Optional. Clears the IGMP tables of all interfaces of the specified type or a specific interface of a particular type. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear ip igmp group ?** for a list of valid interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 9.1	Command was expanded to include the high-bit-rate digital subscriber line (HDSL) and tunnel interfaces.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Usage Examples

The following example clears all statistics from the IGMP tables for all nonstatic IGMP groups:

>**enable**
#clear ip igmp group

clear ip nhrp

Use the **clear ip nhrp** command to clear all Next Hop Resolution Protocol (NHRP) cache entries. Variations of this command include:

clear ip nhrp
clear ip nhrp <*destination ipv4 address*>
clear ip nhrp <*number*>

Syntax Description

<*destination ipv4 address*>	Optional. Specifies that only cache entries matching this address are cleared. Express IPv4 addresses in dotted decimal notation; for example, **10.10.10.1**.
<*number*>	Optional. Specifies that only cache entries matching the Generic Routing Encapsulation (GRE) multipoint tunnel interface number are cleared. Valid range is **1** to **1024**.

Default Values

No default values are necessary for this command.

Command History

Release R11.9.0	Command was introduced.

Usage Examples

The following example clears all NHRP cache entries:

>**enable**
#clear ip nhrp

clear ip ospf

Use the **clear ip ospf** command to reset Open Shortest Path First version 2 (OSPFv2) information. Variations of this command include:

clear ip ospf process
clear ip ospf redistribution

Syntax Description

process	Restarts the OSPF process.
redistribution	Refreshes routes redistributed over OSPF.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example resets the OSPF process:

```
>enable
#clear ip ospf process
```

clear ip policy-sessions

Use the **clear ip policy-sessions** command to clear Internet Protocol version 4 (IPv4) access control policy (ACP) firewall sessions. You may clear all the IPv4 sessions or a specific session. Use the **show ip policy-sessions** command to view a current IPv4 session listing. Variations of this command include:

clear ip policy-sessions
clear ip policy-sessions any-vrf
clear ip policy-sessions pending
clear ip policy-sessions *<ipv4 acp name>* **[ahp | esp | gre | icmp | tcp | udp |** *<protocol>***]** *<ipv4 source> <source port> <ipv4 destination> <destination port>*
clear ip policy-sessions *<ipv4 acp name>* **[ahp | esp | gre | icmp | tcp | udp |** *<protocol>***]** *<ipv4 source> <source port> <ipv4 destination> <destination port>* **[destination | source]** *<nat ipv4 address> <nat address port>*
clear ip policy-sessions vrf *<name>*
clear ip policy-sessions vrf *<name> <ipv4 acp name>* **[ahp | esp | gre | icmp | tcp | udp |** *<protocol>***]** *<ipv4 source> <source port> <ipv4 destination> <destination port>*
clear ip policy-sessions vrf *<name> <ipv4 acp name>* **[ahp | esp | gre | icmp | tcp | udp |** *<protocol>***]** *<ipv4 source> <source port> <ipv4 destination> <destination port>* **[destination | source]** *<nat ipv4 address> <nat port>*

Syntax Description

any-vrf	Optional. Clears the current ACP associations for all virtual routing and forwarding (VRF) instances.
pending	Optional. Clears pending ACP associations that are waiting on unknown traffic.
<ipv4 acp name>	Optional. Specifies the IPv4 ACP from which to clear the firewall sessions.
ahp	Specifies Authentication Header (AH) Protocol.
esp	Specifies Encapsulating Security Payload (ESP) Protocol.
gre	Specifies Generic Routing Encapsulation (GRE) Protocol.
icmp	Specifies Internet Control Message Protocol (ICMP).
tcp	Specifies Transmission Control Protocol (TCP).
udp	Specifies User Datagram Protocol (UDP).
<protocol>	Specifies a protocol. Valid range is **0** to **255**.
<ipv4 source>	Optional. Specifies the source IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<source port>	Optional. Specifies the source port (in hex format AH, ESP, and GRE; decimal for all other protocols).
<ipv4 destination>	Optional. Specifies the destination IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<destination port>	Optional. Specifies the destination port (in hex format for AH, ESP, and GRE; decimal for all other protocols).
[destination | source]	Optional. For network address translation (NAT) sessions, this specifies whether to select a NAT source or NAT destination session.

<nat ipv4 address>	Optional. For NAT sessions, this specifies the NAT IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<nat port>	Optional. For NAT sessions, this specifies the NAT port (in hex format for AH, ESP, and GRE; decimal for all other protocols).
vrf *<name>*	Optional. Specifies the VRF instance to impact. Executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Clearing pending ACP sessions may temporarily disrupt any applications that depend on the presence of pending ACP sessions to allow the application traffic through the firewall.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** and **any-vrf** parameters.
Release R10.1.0	Command was expanded to include the **pending** parameter.

Functional Notes

The second half of this command, beginning with the source IPv4 address, may be copied and pasted from a row in the **show ip policy-sessions** table for easier use.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example clears the Telnet association (TCP port **23**) for an IPv4 policy class **PCLASS1** with source IPv4 address **192.22.71.50** and destination **192.22.71.130**:

```
>enable
#clear ip policy-sessions PCLASS1 tcp 192.22.71.50 23 192.22.71.130 23
```

The following example clears all IPv4 policy class sessions for the VRF instance named **RED**:

```
>enable
#clear ip policy-sessions vrf RED
```

clear ip policy-stats

Use the **clear ip policy-stats** command to clear statistical counters for Internet Protocol version 4 (IPv4) access control policies (ACPs). Variations of this command include:

clear ip policy-stats
clear ip policy-stats <*ipv4 acp name*>
clear ip policy-stats <*ipv4 acp name*> **entry** <*number*>

Syntax Description

<*ipv4 acp name*>	Optional. Specifies the IPv4 ACP to clear. If no IPv4 ACP is specified, statistics are cleared for all policies.
entry <*number*>	Optional. Clears the statistics of a specific IPv4 ACP. Number range is **1** to **4294967295**.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.

Usage Examples

The following example clears statistical counters for all IPv4 ACPs:

>**enable**
#clear ip policy-stats

The following example clears statistical counters for the IPv4 ACP **MatchALL**:

>**enable**
#clear ip policy-stats MatchALL

clear ip prefix-list *<name>*

Use the **clear ip prefix-list** command to clear the IP prefix list hit count shown in the **show ip prefix-list detail** command output. Refer to *show ip prefix-list on page 771* for more information.

Syntax Description

<name>	Clears the count statistics of the specified IP prefix list.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example clears the hit count statistics for prefix list **test**:

```
>enable
#clear ip prefix-list test
```

clear ip route

Use the **clear ip route** command to remove all learned routes from the IP route table. Static and connected routes are not cleared by this command. The command can be limited to a specific virtual routing and forwarding (VRF). Variations of this command include:

clear ip route *
clear ip route <*ip address*> <*subnet mask*>
clear ip route vrf <*name*> ***
clear ip route vrf <*name*> <*ip address*> <*subnet mask*>

Syntax Description

*****	Deletes all destination routes.
<*ip address*>	Specifies the IP address of the destination routes to be deleted. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<*subnet mask*>	Specifies the subnet mask that corresponds to a range of IP addresses (network) or a specific host. Subnet masks can be expressed in dotted decimal notation (for example, **255.255.255.0**) or as a prefix length (for example, **/24**).
vrf <*name*>	Optional. Clears the IP route table for the specified VRF.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example removes all learned routes from the route table:

>**enable**
#clear ip route *

The following example removes all learned routes from the route table on the VRF **RED**:

>**enable**
#clear ip route vrf RED *

clear ip route-cache express

Use the **clear ip route-cache express** command to remove all routes from the hardware forwarding table.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following example clears all routes from the hardware forwarding table:

```
>enable
#clear ip route-cache express
```

clear ip security

Use the **clear ip security** command to clear all statistics associated with the security monitor. Variations of this command include:

clear ip security any-vrf threats
clear ip security monitor
clear ip security threats
clear ip security vrf <*name*> **threats**

Syntax Description

any-vrf threats	Clears statistics on any available VRF on the device.
monitor	Clears all statistics associated with the security monitor.
threats	Clears the IP security threats list.
vrf <*name*> **threats**	Clears statistics on the named VRF.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Functional Notes

The **clear ip security** command is used to clear all statistics associated with the security monitor including policy-stats and excluding timeline and virtual private network (VPN) statistics. The time of the clear is saved.

Usage Examples

The following example clears threat statistics for the named VRF **MyVRF**:

>**enable**
#clear ip security vrf MyVRF threats

clear ip urlfilter statistics

Use the **clear ip urlfilter statistics** command to clear all statistics counters for uniform resource locator (URL) filter requests and responses.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.

Usage Examples

The following example clears all counters for URL filter requests and responses:

```
>enable
#clear ip urlfilter statistics
```

clear ip urlfilter top-websites

Use the **clear ip urlfilter top-websites** command to clear all statistics for top websites reporting.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example clears all statistics for top websites reporting:

```
>enable
#clear ip urlfilter top-websites
```

clear ipv6 access-list

Use the **clear ip access-list** command to clear all counters associated with all Internet Protocol version 6 (IPv6) access control lists (ACLs) or a specified IPv6 ACL. Variations of this command include:

clear ipv6 access-list
clear ipv6 access-list <*ipv6 acl name*>

Syntax Description

<*ipv6 acl name*>	Optional. Specifies the name (label) of an IPv6 ACL to clear.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Usage Examples

The following example clears all counters for the IPv6 ACL labeled **MatchAll**:

>**enable**
#clear ipv6 access-list MatchAll

clear ipv6 cache

Use the **clear ipv6 cache** command to clear all the Internet Protocol version 6 (IPv6) route cache entries in a given virtual routing and forwarding (VRF) instance. Variations of this command include:

clear ipv6 cache
clear ipv6 cache counters
clear ipv6 cache vrf <*name*>
clear ipv6 cache vrf <*name*> **counters**

Syntax Description

counters	Optional. Specifies that only the use-count statistics are cleared for each IPv6 route cache entry.
vrf <*name*>	Optional. Specifies a nondefault VRF instance on which to clear all the IPv6 route cache entries. If no VRF instance is specified, all entries on the default VRF instance are cleared.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.

Usage Examples

The following example clears all the IPv6 route cache entries on the default VRF instance:

>**enable**
#clear ipv6 cache

clear ipv6 dhcp binding

Use the **clear ipv6 dhcp binding** command to remove one or all of the Dynamic Host Control Protocol for Internet Protocol version 6 (DHCPv6) server binding entries. Variations of this command include:

clear ipv6 dhcp binding *
clear ipv6 dhcp binding <*ipv6 address*>
clear ipv6 dhcp binding client-identifier <*client DUID*>
clear ipv6 dhcp binding vrf <*name*> *
clear ipv6 dhcp binding vrf <*name*> <*ipv6 address*>
clear ipv6 dhcp binding vrf <*name*> **client-identifier** <*client DUID*>

Syntax Description

*****	Clears all DHCPv6 server IPv6 address bindings.
<*ipv6 address*>	Clears DHCPv6 server bindings for a single IPv6 address. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**), for example, **2001:DB8:1::1**.
client-identifier <*client DUID*>	Clears the DHCPv6 server bindings for a single DHCPv6 client. The client DHCP unique identifier (DUID) is expressed as a hexadecimal value.
vrf <*name*>	Optional. specifies a nondefault virtual routing and forwarding (VRF) instance from which to remove the binding entries. If no VRF instance is specified, the binding entries are cleared on the default VRF instance.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example specifies that the DHCPv6 server bindings on the default VRF instance for all IPv6 addresses are cleared:

>enable
#clear ipv6 dhcp binding *

clear ipv6 dhcp client <*interface*>

Use the **clear ipv6 dhcp client** command to reinitialize the entire Dynamic Host Control Protocol for Internet Protocol version 6 (DHCPv6) client on the specified interface. Using this command releases and renews ALL parameters requested or assigned using DHCPv6 to this client. This includes addresses, prefixes, and any other configuration information. Variations of this command include:

clear ipv6 dhcp client <*interface*>
clear ipv6 dhcp client mef-ethernet <*slot/port*>
clear ipv6 dhcp client system-control-evc
clear ipv6 dhcp client system-management-evc

Syntax Description

<*interface*>	Specifies the client interface on which to reinitialize the DHCPv6 information. Specify interfaces in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**. Type **clear ipv6 dhcp client ?** for a complete list of valid interfaces.
mef-ethernet <*slot/port*>	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.

Default Values

No default values are necessary for this command.

Command History

Release R10.9.0	Command was introduced.
Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following example reinitializes the entire client and all its associated information for the Ethernet 0/1 interface:

>**enable**
#clear ipv6 dhcp client ethernet 0/1

clear ipv6 dhcp conflict

Use the **clear ipv6 dhcp conflict** command to remove one or all of the Dynamic Host Control Protocol for Internet Protocol version 6 (DHCPv6) server addresses that conflict. Variations of this command include:

clear ipv6 dhcp conflict *
clear ipv6 dhcp conflict <*ipv6 address*>
clear ipv6 dhcp conflict vrf <*name*> ***
clear ipv6 dhcp conflict vrf <*name*> <*ipv6 address*>

Syntax Description

*****	Specifies that all IPv6 address conflicts are cleared.
<*ipv6 address*>	Specifies that the conflicts for a single IPv6 address are cleared. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**), for example, **2001:DB8:1::1**.
vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance from which to remove the conflicting address entries. If no VRF instance is specified, the conflicting entries are cleared on the default VRF instance.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example clears the DHCPv6 server conflict addresses on the default VRF instance for all IPv6 addresses:

>**enable**
#clear ipv6 dhcp conflict *

clear ipv6 ffe

Use the **clear ipv6 ffe** command to manually clear Internet Protocol version 6 (IPv6) RapidRoute entries in the fast forwarding engine (FFE) table. Variations of this command include:

clear ipv6 ffe
clear ipv6 ffe peak
clear ipv6 ffe *<interface>*
clear ipv6 ffe *<interface>* **peak**
clear ipv6 ffe system-control-evc
clear ipv6 ffe system-control-evc peak
clear ipv6 ffe system-management-evc
clear ipv6 ffe system-management-evc peak

Syntax Description

<interface>	Optional. Specifies an ingress interface on which to clear all IPv6 RapidRoute entries. If no interface is specified, then all IPv6 RapidRoute entries in the AOS device are cleared. Specify interfaces in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**. Type **clear ip ffe?** for a complete list of valid interfaces.
peak	Clears the RapidRoute peak entry count. If no interface is specified, the peak entry counts for all interfaces are cleared.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.

Default Values

No default values necessary for this command.

Command History

Release R10.4.0	Command was introduced.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.
Release R11.10.0	Command was expanded to include the **peak** parameter.

Usage Examples

The following example clears all IPv6 RapidRoute entries on the AOS device:

>**enable**
#clear ipv6 ffe

The following example clears the RapidRoute peak entry count for all interfaces:

>**enable**
#clear ipv6 ffe peak

clear ipv6 interfaces prefix

Use the **clear ipv6 interfaces prefix** command to clear Internet Protocol version 6 (IPv6) address prefix information from a specified interface. Variations of this command include:

clear ipv6 interfaces <*interface*> **prefix**
clear ipv6 mef-ethernet <*slot/port*> **prefix**
clear ipv6 interfaces system-control-evc prefix
clear ipv6 interfaces system-management-evc prefix

Syntax Description

<*interface*>	Specifies the interface on which to clear IPv6 address prefix information. Specify interfaces in the <*interface*> <*slot/port* | *interface id*> format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **clear ipv6 interfaces ?** for a list of available interfaces.
mef-ethernet <*slot/port*>	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the tunnel interface.
Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following example specifies that all IPv6 address prefix information is cleared for the **ethernet 0/1** interface:

>**enable**
#clear ipv6 interfaces ethernet 0/1 prefix

clear ipv6 mld traffic

Use the **clear ipv6 mld traffic** command to reset Internet Protocol version 6 (IPv6) Multicast Listener Discovery (MLD) traffic counters to zero. Variations of this command include:

clear ipv6 mld traffic
clear ipv6 mld traffic vrf <*name*>

Syntax Description

vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance on which to reset the MLD counters. If no VRF is specified, the counters on the default VRF are reset.

Default Values

No default values are necessary for this command.

Command History

Release R11.4.0	Command was introduced.

Usage Examples

The following example clears the MLD traffic counters on the default VRF:

```
>enable
#clear ipv6 mld traffic
```

clear ipv6 neighbors

Use the **clear ipv6 neighbors** command to clear dynamic entries from the Internet Protocol version 6 (IPv6) neighbor cache. Variations of this command include:

clear ipv6 neighbors <*interface*>
clear ipv6 neighbors <*interface*> <*ipv6 address*>
clear ipv6 neighbors <*interface*> **statistics**
clear ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc** | **system-management-evc]**
clear ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc** | **system-management-evc]** <*ipv6 address*>
clear ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc** | **system-management-evc]** **statistics**
clear ipv6 neighbors vrf <*name*>
clear ipv6 neighbors vrf <*name*> <*ipv6 address*>
clear ipv6 neighbors vrf <*name*> **statistics**

Syntax Description

<*ipv6 address*>	Optional. Specifies that the neighbor cache entries for a specific IPv6 address are cleared. Specify IPv6 addresses in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. If no IPv6 address is specified, all entries are cleared.
<*interface*>	Optional. Specifies that the neighbor cache entries for a specific interface are cleared. Specify interfaces in the <*interface*> <*slot/port* | *interface id*> format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. If no interface is specified, all entries for all interfaces on the virtual routing and forwarding (VRF) instance are cleared.
mef-ethernet <*slot/port*>	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
statistics	Optional. Specifies that statistics for the neighbor cache and protocol interaction are cleared.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.
vrf <*name*>	Optional. Specifies that neighbor cache entries for a specific VRF instance are cleared. If no VRF is specified, entries on the default unnamed VRF are cleared.

Default Values

By default, if no options are specified, entering this command clears all neighbor cache entries on all interfaces assigned to the default VRF.

Command History

Release 18.1	Command was introduced.

Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following example clears all entries in the neighbor cache for the default VRF:

>**enable**
#clear ipv6 neighbors

clear ipv6 policy-sessions

Use the **clear ipv6 policy-sessions** command to clear Internet Protocol version 6 (IPv6) access control policy (ACP) sessions from the firewall association database. Clearing a session typically terminates the session's communication, therefore this command should be used carefully, particularly if the session is one used for access to the command line interface (CLI). You may clear all the IPv6 sessions or a specific IPv6 session. Use the **show ipv6 policy-sessions** command to view a current IPv6 session listing. Variations of this command include:

clear ipv6 policy-sessions
clear ipv6 policy-sessions <*ipv6 acp name*> **[ahp | esp | gre |** <*protocol*>**]** <*ipv6 source*> **[**<*interface*>**]** <*ipv6 destination*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions <*ipv6 acp name*> **[tcp | udp]** <*ipv6 source*> **[**<*interface*>**]** <*source port*> <*ipv6 destination*> <*destination port*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions <*ipv6 acp name*> **icmpv6** <*ipv6 source*> **[**<*interface*>**]** <*id*> <*ipv6 destination*> <*type/code*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions any-vrf
clear ipv6 policy-sessions pending
clear ipv6 policy-sessions pending any-vrf
clear ipv6 policy-sessions pending <*ipv6 acp name*> **[ahp | esp | gre |** <*protocol*>**]** <*ipv6 source*> **[**<*interface*>**]** <*ipv6 destination*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions pending <*ipv6 acp name*> **[tcp | udp]** <*ipv6 source*> **[**<*interface*>**]** <*source port* | **unknown**> <*ipv6 destination*> <*destination port* | **unknown**> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions pending <*ipv6 acp name*> **icmpv6** <*ipv6 source*> **[**<*interface*>**]** <*id*> <*ipv6 destination*> <*type/code*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions pending vrf <*name*> <*ipv6 acp name*> **[tcp | udp]** <*ipv6 source*> **[**<*interface*>**]** <*source port* | **unknown**> <*ipv6 destination*> <*destination port* | **unknown**> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions vrf <*name*>
clear ipv6 policy-sessions vrf <*name*> <*ipv6 acp name*> **[ahp | esp | gre |** <*protocol*>**]** <*ipv6 source*> **[**<*interface*>**]** <*ipv6 destination*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions vrf <*name*> <*ipv6 acp name*> **[tcp | udp |** <*protocol*>**]** <*ipv6 source*> **[**<*interface*>**]** <*source port* | **unknown**> <*ipv6 destination*> <*destination port* | **unknown**> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
clear ipv6 policy-sessions vrf <*name*> <*ipv6 acp name*> **icmpv6** <*ipv6 source*> **[**<*interface*>**]** <*id*> <*ipv6 destination*> <*type/code*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**

Syntax Description

any-vrf	Optional. Specifies that all sessions in all virtual routing and forwarding (VRF) instances are cleared.

pending	Optional. Specifies that any associations waiting on unknown traffic are cleared.
<ipv6 acp name>	Optional. Specifies the IPv6 ACP from which to clear the firewall sessions.
ahp	Specifies Authentication Header (AH) Protocol.
esp	Specifies Encapsulating Security Payload (ESP) Protocol.
gre	Specifies Generic Routing Encapsulation (GRE) Protocol.
icmpv6	Specifies Internet Control Message Protocol (ICMP) version 6 (ICMPv6).
mef-ethernet *<slot/port>*	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.
tcp	Specifies Transmission Control Protocol (TCP).
udp	Specifies User Datagram Protocol (UDP).
<protocol>	Specifies a protocol. Valid range is **0** to **255**.
<ipv6 source>	Specifies the source IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (**X:X:X:X::X**). For example, **2001:DB8:1::1**.
<source port>	Specifies the source port for TCP and UDP sessions. Range is **0** to **65535**.
<ipv6 destination>	Specifies the destination IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (**X:X:X:X::X**). For example, **2001:DB8:1::1**.
<destination port>	Specifies the destination port for TCP and UDP sessions. Range is **0** to **65535**.
<interface>	Specifies the interface when a link-local IPv6 address is entered (addresses beginning with **FE80::**). Interfaces must be entered when using a link-local address. Specify interfaces in the *<interface> <slot/port* | *interface id>* format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**.
<id>	Specifies the ICMPv6 ID. Valid range is **0** to **65535**.
<type/code>	Specifies the type and code of the ICMPv6 session to be cleared. Type and code ranges are **0** to **255**.
unknown	Specifies that the source or destination port is unknown.
vrf *<name>*	Optional. Specifies the VRF instance to impact. Executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Release R10.1.0	Command was expanded to include the tunnel interface and the **pending** parameter.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.7.0	Command was expanded to include the **unknown** parameter.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.
Release R13.7.0	Command was expanded to include the Gigabit Ethernet and virtual local area network (VLAN) interfaces.

Functional Notes

The second half of this command, beginning with the source IPv6 address, can be copied and pasted from a row in the **show ipv6 policy-sessions** table for easier use.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example clears the Telnet association (TCP port **23**) for IPv6 ACP **pclass1** with source IPv6 address **FE80::2AO:C8FF:FE61:3082** and destination IPv6 address **2003::2AO:C8FF:FE61:3084**. Because the source IPv6 address is a link-local address (**FE80::**), the appropriate interface (in this case **ethernet 0/1**) must be entered after the source IPv6 address. Enter the command as follows:

>**enable**
#clear ipv6 policy-sessions pclass1 tcp FE80::2AO:C8FF:FE61:3082 ethernet 0/1
2003::2AO:C8FF:FE61:3084

The following example clears all IPv6 policy class sessions for the VRF instance named RED:
>**enable**

#clear ipv6 policy-sessions vrf RED

clear ipv6 policy-stats

Use the **clear ipv6 policy-stats** command to clear statistical counters for IPv6 access control policies (ACPs). Variations of this command include:

clear ipv6 policy-stats
clear ipv6 policy-stats <*ipv6 acp name*>
clear ipv6 policy-stats <*ipv6 acp name*> **entry** <*number*>

Syntax Description

<*ipv6 acp name*>	Optional. Specifies the IPv6 ACP statistics to clear. If no IPv6 ACP is specified, statistics are cleared for all IPv6 ACPs.
entry <*number*>	Optional. Specifies only a specific entry within the IPv6 ACP is cleared. Number range is **1** to **4294967295**.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Usage Examples

The following example clears statistical counters for all IPv6 ACPs:

>**enable**
#clear ipv6 policy-stats

The following example clears statistical counters for the IPv6 ACP **MatchALL**:

>**enable**
#clear ipv6 policy-stats MatchALL

The following example clears statistical counters for the **6**th entry in the IPv6 ACP **MatchALL**:

>**enable**
#clear ipv6 policy-stats MatchALL entry 6

clear ipv6 prefix-list *<name>*

Use the **clear ipv6 prefix-list** command to clear statistics associated with the Internet Protocol version 6 (IPv6) prefix list.

Syntax Description

<name>	Clears the hit count statistics of the specified IPv6 prefix list.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example clears the hit count statistics for the IPv6 prefix list **TEST1**:

```
>enable
#clear ipv6 prefix-list TEST1
```

clear ipv6 routers

Use the **clear ipv6 routers** command to clear the Internet Protocol version 6 (IPv6) list of routers learned from router advertisement (RA) messages from locally reachable routers. Variations of this command include:

clear ipv6 routers <*interface*>
clear ipv6 routers <*interface*> **conflict**
clear ipv6 routers [system-control-evc | **system-management-evc]**
clear ipv6 routers [system-control-evc | **system-management-evc] conflict**
clear ipv6 routers vrf <*name*>
clear ipv6 routers vrf <*name*> **conflict**

Syntax Description

<*interface*>	Optional. Specifies an interface from which to clear the learned router list. If no interface is specified, learned routers on all interfaces of the virtual routing and forwarding (VRF) are cleared. Specify interfaces in the <*interface*> <*slot/port* | *interface id*> format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **clear ipv6 routers ?** for a list of available interfaces.
conflict	Optional. Specifies that learned routers with misconfigurations are cleared from locally reachable routers.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.
system-management-evc	Specifies the system management EVC. This EVC is preconfigured on the unit.
vrf <*name*>	Optional. Specifies a VRF on which to clear learned routers. If no VRF is specified, learned routers for all interfaces on the default VRF are cleared.

Default Values

By default, all learned routers from all interfaces on the default VRF are cleared when no options are specified.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the tunnel interface.
Release R.10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.

Usage Examples

The following example specifies that learned routers are cleared from all interfaces on the default VRF:

>enable
#clear ipv6 routers

clear lldp counters interface *<interface>*

Use the **clear lldp counters interface** command to reset all Link Layer Discovery Protocol (LLDP) packet counters to zero on all interfaces.

Syntax Description

<interface>	Clears the information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear lldp counters interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet and gigabit switchport interfaces.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example resets all LLDP counters:

```
>enable
#clear lldp counters interface
```

clear lldp neighbors

Use the **clear lldp neighbors** command to remove all neighbors from this unit's database. As new Link Layer Discovery Protocol (LLDP) frames are received, the database will contain information about neighbors included in those frames.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.

Functional Notes

This command generates output indicating the names of any neighbors deleted from the database and the name of the interface on which the neighbor was learned.

Usage Examples

The following example clears LLDP neighbor **Switch_1** from the Ethernet interface 0/7:

```
>enable
#clear lldp neighbors
LLDP: Deleted neighbor “Switch_1” on interface eth 0/7
#
```

clear mac address-table

Use the **clear mac address-table** command to remove medium access control (MAC) addresses from the MAC address table. Variations of this command include:

clear mac address-table
clear mac address-table <*interface*>

Syntax Description

<*interface*>	Optional. Removes the MAC address of the specified interface. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear mac address-table interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example removes the MAC address of a Gigabit Ethernet interface from the MAC address table:

>**enable**
#clear mac address-table gigabit-ethernet 0/1

clear mac address-table dynamic

Use the **clear mac address-table dynamic** command to remove dynamic medium access control (MAC) addresses from the MAC address table. Variations of this command include:

clear mac address-table dynamic <*interface*>
clear mac address-table dynamic address <*mac address*>

Syntax Description

<*interface*>	Removes the MAC address of the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear mac address-table dynamic interface ?** for a complete list of applicable interfaces.
address <*mac address*>	Removes a specific MAC address from the table. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example removes the dynamic address **A0:B1:C2:D3:E4:A1** from the MAC address table:

```
>enable
#clear mac address-table dynamic address A0:B1:C2:D3:E4:A1
```

The following example removes all dynamic addresses from the MAC address table:

```
>enable
#clear mac address-table dynamic
```

clear mac address-table multicast

Use the **clear mac address-table multicast** command to clear all entries in the multicast address resolution lookup (ARL) table or filter the entries based on certain criteria. Variations of this command include:

clear mac address-table multicast
clear mac address-table multicast igmp-snooping
clear mac address-table multicast user
clear mac address-table multicast vlan <*vlan id*>
clear mac address-table multicast vlan <*vlan id*> **igmp-snooping**
clear mac address-table multicast vlan <*vlan id*> **user**

Syntax Description

igmp-snooping	Optional. Clears entries in the multicast ARL table that were added dynamically (via IGMP snooping).
user	Optional. Clears entries in the multicast ARL table that were added statically (by the user).
vlan <*vlan id*>	Optional. Clears entries in the multicast ARL table based on virtual local area network (VLAN).

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.

Usage Examples

The following example removes the entries in the multicast ARL table for **VLAN 200**:

>**enable**
#clear mac address-table multicast vlan 200

clear mail-client body *<agent name>*

Use the **clear mail-client body** command to clear the body text of the pending email message for a specific mail agent.

Syntax Description

<agent name>	Specifies which mail agent body text is cleared.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example clears pending email body text for mail agent **myagent**:

```
>enable
#clear mail-client body myagent
```

clear mail-client counters

Use the **clear mail-client counters** command to clear all statistical counters associated with all mail agents. Variations of this command include:

clear mail-client counters
clear mail-client counters *<agent name>*

Syntax Description

<agent name>	Optional. Specifies that only a specific mail agent's counters are cleared.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example clears all counters for all configured mail agents:

>**enable**
#clear mail-client counters

clear network-forensics ip dhcp

Use the **clear network-forensics ip dhcp** command to remove the Dynamic Host Configuration Protocol (DHCP) statistics for clients connected to the network. Statistics can be cleared for a single client or for all clients. Variations of this command include:

clear network-forensics ip dhcp
clear network-forensics ip dhcp hostname <*hostname*>
clear network-forensics ip dhcp interface gigabit-switchport <*slot/port*>
clear network-forensics ip dhcp ip <*ip address*>
clear network-forensics ip dhcp mac <*mac address*>
clear network-forensics ip dhcp vlan <*vlan id*>

Syntax Description

hostname <*hostname*>	Optional. Clears statistics for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Clears statistics for the client using the specified interface.
ip <*ip address*>	Optional. Clears the statistics for the client with the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
mac <*mac address*>	Optional. Clears the statistics for the client with the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
vlan <*vlan id*>	Optional. Clears the statistics for the client with the specified virtual local area network (VLAN) identification number. VLAN IDs range from **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.

Usage Examples

The following example clears all collected DHCP statistics for all clients:

>**enable**
#clear network-forensics ip dhcp

The following example clears all collected DHCP statistics for the client with the MAC address **00:A0:C8:00:00:01**:

>**enable**
#clear network-forensics ip dhcp mac 00:A0:C8:00:00:01

clear network-sync

Use the **clear network-sync** command to clear network synchronization (Network Sync) related information from the unit's configuration. Variations of this command include:

clear network-sync
clear network-sync info

Syntax Description

info	Optional. Specifies that all Network Sync statistical information is cleared.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example clears all statistical information for Network Sync:

>**enable**
#clear network-sync info

clear ntp

Use the **clear ntp** command to restart the Network Time Protocol (NTP) daemon.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example restarts the NTP daemon:

```
>enable
#clear ntp
```

clear ospfv3

Use the **clear ospfv3** command to reset and restart specific Open Shortest Path First version 3 (OSPFv3) processes, and to refresh routes distributed into OSPFv3 processes. Variations of this command include:

clear ospfv3 <*process id*> **process**
clear ospfv3 <*process id*> **redistribution**
clear ospfv3 process
clear ospfv3 redistribution

Syntax Description

<*process id*>	Optional. Restarts or resets the specified OSPFv3 process, or refreshes routes distributed only to the specified process.
process	Specifies that all OSPFv3 processes are reset and restarted.
redistribution	Specifies that all routes distributed into OSPFv3 processes are refreshed.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example resets and restarts OSPFv3 process **5**:

>**enable**
#clear ospfv3 5 process

The following example refreshes all routes distributed into OSPFv3 processes:

>**enable**
#clear ospfv3 redistribution

clear performance-statistics

Use the **clear performance-statistics** command to clear the performance monitoring statistics on a particular interface or Ethernet virtual connection (EVC). Variations of this command include:

clear performance-statistics evc <*name*>
clear performance-statistics <*interface*>

Syntax Description

evc <*name*>	Specifies an EVC on which to clear the performance statistics.
<*interface*>	Specifies the interface on which to clear the performance statistics. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear performance-statistics ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.
Release R11.2.0	Command was expanded to include the very high-speed digital subscriber line (VDSL).
Release R11.5.0	Command was expanded to include the EVC option.

Usage Examples

The following example clears all performance statistics on the Ethernet subinterface **1/1.1**:

>**enable**

#clear performance-statistics ethernet 1/1.1

clear port-security

Use the **clear port-security** command to clear the dynamic or sticky secure medium access control (MAC) addresses associated with an interface. This can be done on a per-address or per-port basis. Variations of this command include the following:

clear port-security dynamic address <*mac address*>
clear port-security dynamic interface <*interface*>
clear port-security sticky address <*mac address*>
clear port-security sticky interface <*interface*>

Syntax Description

dynamic	Clears the dynamic MAC addresses.
sticky	Clears the sticky secure MAC addresses.
address <*mac address*>	Clears the information for the specified MAC address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
interface <*interface*>	Clears the information for the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear port-security sticky interface ?** or **clear port-security dynamic interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following command clears all dynamic secure MAC addresses associated with the Ethernet interface 0/1:

>**enable**
#clear port-security dynamic interface eth 0/1

clear port-security violation-count *<interface>*

Use the **clear port-security violation-count** command to clear the violation count associated with a particular interface.

Syntax Description

<interface>	Clears the information for the specified Ethernet interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear port-security violation-count interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following command clears the violation count associated with the Ethernet interface 0/1:

```
>enable
#clear port-security violation-count eth 0/1
```

clear pppoe

Use the **clear pppoe** command to terminate the current Point-to-Point Protocol over Ethernet (PPPoE) client session and cause AOS to attempt to re-establish the session. Variations of this command include:

clear pppoe <*interface*>
clear pppoe system-control-evc

Syntax Description

<*interface*>	Specifies the Point-to-Point Protocol (PPP) interface ID number to clear. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear pppoe ?** for a complete list of valid interfaces.
system-control-evc	Specifies the system control Ethernet virtual connection (EVC). This EVC is preconfigured on the unit.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release R.10.10.0	Command was expanded to include the **system-control-evc** parameter.

Usage Examples

The following example ends the current PPPoE client session for ppp 1:

>enable
#clear pppoe 1

clear probe responder

Use the **clear probe responder** command to remove entries from the probe responders. Variations of this command include:

clear probe responder counters
clear probe responder icmp-timestamp counters
clear probe responder twamp counters
clear probe responder udp-echo counters

Syntax Description

counters	Clears the probe responder counters.
icmp-timestamp	Clears the Internet Control Message Protocol (ICMP) timestamp probe responder counters.
twamp	Clears the Two-Way Active Measurement Protocol (TWAMP) probe responder counters.
udp-echo	Clears the User Datagram Protocol (UDP) echo probe responder counters.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example removes the TWAMP responder counters:

>**enable**
#clear probe responder twamp counters

clear processes cpu max

Use the **clear processes cpu max** command to clear the maximum CPU usage statistic, which is displayed in the **show process cpu** command output.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example resets the CPU maximum usage statistics:

```
>enable
#clear processes cpu max
```

clear processes queue

Use the **clear processes queue** command to clear the contents of the system processing queues.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example clears the contents of the system processing queues:

```
>enable
#clear processes queue
```

clear qos map

Use the **clear qos map** command to clear the statistics for all defined quality of service (QoS) maps or for maps meeting user-configured specifications. Variations of this command include the following:

clear qos map
clear qos map <*name*>
clear qos map <*name*> **default**
clear qos map <*name*> <*number*>
clear qos map interface <*interface*>
clear qos map interface efm-group <*group id*>

Syntax Description

<*name*>	Optional. Clears the statistics of a defined QoS map.
<*number*>	Optional. Clears the statistics for one of the map's specified sequence numbers.
default	Optional. Clears the default QoS map entry.
efm-group <*group id*>	Specifies an Ethernet in the first mile (EFM) group ID. Range is **1** to **1024**.
interface <*interface*>	Optional. Clears QoS map statistics for the specified interface. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**.Type **clear qos map interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the **default** parameter and Ethernet interface.
Release R11.1.0	Command was expanded to include the system control Ethernet virtual connection (EVC) and system management EVC.
Release R11.4.0	Command was expanded to include the EFM group.
Release R11.9.0	Command was expanded to include the tunnel interface.

Usage Examples

The following example clears statistics for all defined QoS maps:

#clear qos map

The following example clears statistics for all entries in the **priority** QoS map:

#clear qos map priority

The following example clears statistics in entry **10** of the **priority** QoS map:

#clear qos map priority 10

The following example clears QoS statistics for a specified interface:

#clear qos map interface frame-relay 1

*The **clear counters** command clears ALL interface statistics (including QoS map interface statistics).*

clear relay

Use the **clear relay** command to reset the door contact relay.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example resets the door contact relay:

```
>enable
#clear relay
```

clear route-map counters

Use the **clear route-map counters** command to reset route map hit counters. Variations of this command include:

clear route-map counters
clear route-map counters <*name*>

Syntax Description

<*name*>	Optional. Clears the counters for the specified route map.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example clears all route map counters:

>**enable**
#clear route-map counters

clear rtp quality-monitoring

Use the **clear rtp quality-monitoring** command to clear all voice quality monitoring (VQM) statistics or only VQM statistics from the call history or a particular interface. Variations of this command include:

clear rtp quality-monitoring
clear rtp quality-monitoring call-history
clear rtp quality-monitoring interface <*interface*>

Syntax Description

call-history	Optional. Removes call statistics from the call history only.
interface <*interface*>	Optional. Clears all interface VQM statistics for the specified interface. Specifies an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear ip rtp quality-monitoring interface ?** for a valid list of interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 17.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following example clears all VQM statistics from the call history:

>**enable**
#clear rtp quality-monitoring call-history

clear rtp quality-monitoring reporter

Use the **clear rtp quality-monitoring reporter** command to clear all statistics associated with all configured voice quality monitoring (VQM) reporters. Variations of this command include:

clear rtp quality-monitoring reporter
clear rtp quality-monitoring reporter <*name*>

Syntax Description

<*name*>	Optional. Clears statistics for only the specified VQM reporter.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following example clears only the statistics associated with VQM reporter **Reporter1**:

>**enable**
#clear rtp quality-monitoring reporter Reporter1

clear sip location <*username*>

Use the **clear sip location** command to clear Session Initiation Protocol (SIP) location database statistics. Variations of this command include:

clear sip location *
clear sip location <*username*>

Syntax Description

*	Clears all SIP location database statistics.
<*username*>	Clears the statistics for the specified user name.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example deletes all dynamic location entries:

```
>enable
#clear sip location *
```

clear sip resources

Use the **clear sip resources** command to clear the counters for Session Initiation Protocol (SIP) resources currently in use. Refer to *show sip on page 998* for information about using the **show sip resources** command to display the current SIP resource information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.9	Command was introduced for AOS data products.
Release A4.01	Command was included for AOS voice products.

Usage Examples

The following example clears SIP server resource counters:

```
>enable
#clear sip resources
```

clear sip secure remote-user

Use the **clear sip secure remote-user** command to clear statistics for Session Initiation Protocol (SIP) security remote user blacklist entries and dropped requests. If you do not specify the IPv4 address for the blacklist item to clear, all blacklist items are cleared. Refer to *show sip secure remote-user on page 1004* for information about using the **show sip secure** command to display the current SIP security remote user statistics. Variations of this command include:

clear sip secure remote-user blacklist
clear sip secure remote-user blacklist *<ipv4 address>*
clear sip secure remote-user dropped-requests

Syntax Description

blacklist	Optional. Displays UDP SIP security blacklist entries.
<ipv4 address>	Optional. Specifies a valid IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
dropped-requests	Optional. Displays UDP SIP security dropped requests due to failed authentication attempts.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.

Usage Examples

The following example clears all entries from the SIP security remote user blacklist table:

>enable
#clear sip secure remote-user blacklist

clear sip tls session

Use the **clear sip tls session** command to clear statistics for active Session Initiation Protocol (SIP) Transport Layer Security (TLS) sessions. Variations of this command include:

clear sip tls session *
clear sip tls session <*session ID*>

Syntax Description

*****	Specifies that statistics for all TLS sessions are cleared.
<*session ID*>	Specifies that statistics for the individual TLS session are cleared. The session ID value can be determined using the command *show tls sessions on page 1053*.

Default Values

No default values are necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example clears statistics for all TLS sessions:

>**enable**
#clear sip tls session *

clear sip trunk-registration

Use the **clear sip trunk-registration** command to clear local Session Initiation Protocol (SIP) registration information for one or more trunks. Variations of this command include:

clear sip trunk-registration
clear sip trunk-registration <*Txx*>
clear sip trunk-registration <*Txx*> <*trunk id*>

Syntax Description

<*Txx*>	Optional. Specifies the trunk to clear using its two-digit identifier (for example, **T01**).
<*trunk id*>	Optional. Clears the registration information for the specified trunk.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example clears SIP registration information for trunk 01:

>**enable**
#clear sip trunk-registration T01

clear sip user-registration

Use the **clear sip user-registration** command to clear local Session Initiation Protocol (SIP) server registration information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example clears all SIP server registration information:

```
>enable
#clear sip user-registration
```

clear spanning-tree counters

The **clear spanning-tree counters** command clears the following counts: bridge protocol data unit (BPDU) transmit, BPDU receive, and number of transitions to forwarding state. Variations of this command include:

clear spanning-tree counters
clear spanning-tree counters interface *<interface>*

Syntax Description

interface *<interface>*	Optional. Specifies a single interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear spanning-tree counters ?** for a complete list of interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example clears the spanning tree counters for Ethernet 0/10:

>enable
#clear spanning-tree counters interface eth 0/10

clear spanning-tree detected-protocols

Use the **clear spanning-tree detected-protocols** command to restart the protocol migration process. Variations of this command include:

clear spanning-tree detected-protocols
clear spanning-tree detected-protocols interface <*interface*>

Syntax Description

interface <*interface*>	Optional. Specifies a valid interface to clear. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear spanning-tree detected-protocols interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Functional Notes

The switch has the ability to operate using the rapid spanning-tree protocol or the legacy 802.1D version of spanning-tree. When a bridge protocol data unit (BPDU) of the legacy version is detected on an interface, the switch automatically regresses to using the 802.1D spanning-tree protocol for that interface. Issue the **clear spanning-tree detected-protocols** command to return to rapid spanning-tree operation.

Usage Examples

The following example re-initiates the protocol migration process on Ethernet interface 0/3:

```
>enable
#clear spanning-tree detected-protocols interface ethernet 0/3
```

The following example re-initiates the protocol migration process on all interfaces:

```
>enable
#clear spanning-tree detected-protocols
```

clear ssh port-forward

Use the **clear ssh port-forward** command to remove a previously defined secure shell (SSH) port forwarding. Variations of this command include:

clear ssh port-forward <*port-forward port*> <*url*>
clear ssh port-forward <*port-forward port*> <*url*> **myprivkey dsa**
clear ssh port-forward <*port-forward port*> <*url*> **password** <*password*>
clear ssh port-forward <*port-forward port*> <*url*> **port** <*port*>
clear ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **myprivkey dsa**
clear ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **password** <*password*>
clear ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **privkey** <*filename*>
clear ssh port-forward <*port-forward port*> <*url*> **privkey** <*filename*>

Syntax Description

<*port-forward port*>	Specifies the forwarded port on the local unit.
<*url*>	Specifies the uniform resource locator (URL) of the far end listening address. The format of the URL string must be **user@server:remote-port**, for example, MGARCIA@10.10.10.1:7000. Optionally, you may include the IP address of an interface on the remote machine using the format **user@server:remote-port:FarEndListenAddress**, for example, MGARCIA@10.10.10.1:7000:10.10.10.2.
myprivkey dsa	Optional. Specifies to use the AOS unit's digital signature algorithm (DSA) private key for SSH authentication.
password <*password*>	Optional. Specifies a password to use for SSH authentication.
port <*port*>	Optional. Specifies a port to use for the underlying SSH protocol instead of the default SSH port 22. Valid range is **1** to **65535**.
privkey <*filename*>	Optional. Specifies a private key file to use for SSH authentication.

Default Values

No default values are necessary for this command.

Command History

Release 11.4.0	Command was introduced.

Usage Examples

The following example removes the forward of port **22** on the AOS device for user **MGARCIA** using port **7000** on device **10.10.10.1**:

>enable
#clear ssh port-forward 22 MGARCIA@10.10.10.1:7000 password PASSWORD

clear tacacs+ statistics

Use the **clear tacacs+ statistics** command to delete all terminal access controller access-control system plus (TACACS+) protocol statistics.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example clears all TACACS+ protocol statistics:

```
>enable
#clear tacacs+ statistics
```

clear user

Use the **clear user** command to detach a user from a given line. Variations of this command include:

clear user console <*number*>
clear user ssh <*number*>
clear user telnet <*number*>

Syntax Description

console <*number*>	Detaches a specific console user. Valid range is **0** to **1**.
ssh <*number*>	Detaches a specific secure shell (SSH) user. Valid range is **0** to **4**.
telnet <*number*>	Detaches a specific Telnet user. Valid range is **0** to **5**.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example detaches the **console 1** user:

>**enable**
#clear user console 1

clear voice logging smdr

Use the **clear voice logging smdr** command to clear the local station messaging detail record (SMDR) log.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A5.01	Command was introduced.

Usage Examples

The following example clears the SMDR log:

```
>enable
#clear voice logging smdr
```

clear voice queue <*extension*>

Use the **clear voice queue** command to reset statistics for all call queues or the specified call queue.

Syntax Description

<*extension*>	Indicates the extension of the call queue.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example resets the statistics on the call queue on extension **6407**:

>**enable**
#clear voice queue 6407

clear vrrp counters

Use the **clear vrrp counters** command to clear the Virtual Router Redundancy Protocol (VRRP) statistics. The following are variations of this command:

clear vrrp counters
clear vrrp counters interface <*interface*>
clear vrrp counters interface <*interface*> **group** <*number*>

Syntax Description

interface <*interface*>	Optional. Clears all VRRP statistics on the specified interface. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear vrrp counters interface ?** for a complete list of valid interfaces.
group <*number*>	Optional. Clears all VRRP statistics for the specified group on the specified interface. Group numbers range from 1 to 255.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

Although VRRP group virtual router IDs (VRIDs) can be numbered between 1 and 255, only two VRRP routers per interface are supported.

Usage Examples

The following example clears all VRRP group statistics on all interfaces:

>**enable**
#clear vrrp counters

clear vrrpv3 counters

Use the **clear vrrpv3 counters** command to clear all Virtual Router Redundancy Protocol version 3 (VRRPv3) statistics. Variations of this command include:

clear vrrpv3 counters
clear vrrpv3 counters interface <*interface*>
clear vrrpv3 counters interface <*interface*> **group** <*vrid*>
clear vrrpv3 counters ipv4
clear vrrpv3 counters ipv6

Syntax Description

interface <*interface*>	Optional. Clears all VRRPv3 statistics on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **clear vrrpv3 counters interface ?** for a complete list of valid interfaces.
group <*vrid*>	Optional. Clears all VRRPv3 statistics for the specified group virtual router ID (VRID) on the specified interface. Group VRIDs range from **1** to **255**.
ipv4	Optional. Clears all VRRPv3 statistics for the IPv4 address family.
ipv6	Optional. Clears all VRRPv3 statistics for the IPv6 address family.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.
Release R10.11.0	Command was expanded to include the **ipv4** and **ipv6** parameters.

Functional Notes

Although VRRPv3 group VRIDs can be numbered between 1 and 255, only two VRRPv3 routers per interface per IP version are supported.

Usage Examples

The following example clears all VRRPv3 group statistics on all interfaces:

>**enable**
#clear vrrpv3 counters

clear vxlan host

Use the **clear vxlan host** command to clear the remote host entries learned from the virtual extensible local area network (VxLAN) peers. Variations of this command include:

clear vxlan host <*mac address*>
clear vxlan host tunnel <*interface id*>
clear vxlan host vni <*number*>

Syntax Description

<*mac address*>	Clears host entries with the specified mac address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, 00:A0:C8:00:00:01).
tunnel <*interface id*>	Clears host entries with the specified tunnel interface. Valid interface range is **1** to **1024**.
vni <*number*>	Clears host entires with the specified VxLAN network ID (VNI). Valid range is **1** to **677215**.

Default Values

No default values are necessary for this command.

Command History

Release 13.1.0	Command was introduced.

Usage Examples

The following example clears the remote host entries for MAC address 00:A0:C8:00:00:01:

>**enable**
#clear vxlan host 00:A0:C8:00:00:01

clock auto-correct-dst

The **clock auto-correct-dst** command allows the automatic one-hour correction for daylight savings time (DST). Use the **clock no-auto-correct-dst** command to disable this feature.

Syntax Description

No subcommands.

Default Values

By default, this command is enabled.

Command History

Release 6.1	Command was introduced.

Usage Examples

The following example allows for automatic DST correction:

```
>enable
#clock auto-correct-dst
```

clock no-auto-correct-dst

The **clock no-auto-correct-dst** command allows you to override the automatic one-hour correction for daylight savings time (DST).

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.

Functional Notes

Many time zones include an automatic one-hour correction for daylight savings time at the appropriate time. You may override it at your location using this command.

Usage Examples

The following example overrides the one-hour offset for DST:

```
>enable
#clock no-auto-correct-dst
```

clock set *<time> <day> <month> <year>*

Use the **clock set** command to configure the system software clock. For the command to be valid, all fields must be entered. Refer to the *Usage Examples* below for an example.

Syntax Description

<time>	Sets the time (in 24-hour format) of the system software clock in the format hours:minutes:seconds (HH:MM:SS).
<day>	Sets the current day of the month. Valid range is 1 to 31.
<month>	Sets the current month. Valid range is January to December. You need only enter enough characters to make the entry unique. This entry is not case sensitive.
<year>	Sets the current year. Valid range is 2000 to 2100.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example sets the system software clock for 3:42 p.m., August 22, 2004:

>enable
#clock set 15:42:00 22 Au 2004

clock timezone <*value*>

The **clock timezone** command sets the unit's internal clock to the time zone of your choice. This setting is based on the difference in time (in hours) between Greenwich Mean Time (GMT) or Central Standard Time (CST) and the time zone for which you are setting up the unit. Use the **no** form of this command to disable this feature.

Syntax Description

<*value*>	Clock time zone values are specified in the *Functional Notes* section for this command.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 11.1	Command was expanded to include the **clock timezone 0**.

clock timezone +1-Amsterdam
clock timezone +1-Belgrade
clock timezone +1-Brussels
clock timezone +1-Sarajevo
clock timezone +1-West-Africa
clock timezone +10-Brisbane
clock timezone +10-Canberra
clock timezone +10-Guam
clock timezone +10-Hobart
clock timezone +10-Vladivostok
clock timezone +11
clock timezone +12-Auckland
clock timezone +12-Fiji
clock timezone +13
clock timezone +2-Athens
clock timezone +2-Bucharest
clock timezone +2-Cairo
clock timezone +2-Harare
clock timezone +2-Helsinki
clock timezone +2-Jerusalem
clock timezone +3-Baghdad
clock timezone +3-Kuwait
clock timezone +3-Moscow
clock timezone +3-Nairobi
clock timezone +3:30
clock timezone +4-Abu-Dhabi
clock timezone +4-Baku
clock timezone +4:30
clock timezone +5-Ekaterinburg
clock timezone +5-Islamabad
clock timezone +5:30
clock timezone +5:45
clock timezone +6-Almaty
clock timezone +6-Astana
clock timezone +6-Sri-Jay
clock timezone +6:30
clock timezone +7-Bangkok
clock timezone +7-Kranoyarsk
clock timezone +8-Bejing
clock timezone +8-Irkutsk
clock timezone +8-Kuala-Lumpur
clock timezone +8-Perth
clock timezone +8-Taipei
clock timezone +9-Osaka
clock timezone +9-Seoul
clock timezone +9-Yakutsk
clock timezone +9:30-Adelaide
clock timezone +9:30-Darwin

Functional Notes

The following list shows sample cities and their time zone codes.

clock timezone -1-Azores
clock timezone -1-Cape-Verde
clock timezone -10
clock timezone -11
clock timezone -12
clock timezone -2
clock timezone -3-Brasilia
clock timezone -3-Buenos-Aires
clock timezone -3-Greenland
clock timezone -3:30
clock timezone -4-Atlantic-Time
clock timezone -4-Caracus
clock timezone -4-Santiago
clock timezone -5
clock timezone -5-Bogota
clock timezone -5-Eastern-Time
clock timezone -6-Central-America
clock timezone -6-Central-Time
clock timezone -6-Mexico-City
clock timezone -6-Saskatchewan
clock timezone -7-Arizona
clock timezone -7-Mountain-Time
clock timezone -8
clock timezone -9
clock timezone 0-Universal Coordinated Time (UTC)
clock timezone GMT-Casablanca
clock timezone GMT-Dublin

Usage Examples

The following example sets the time zone for Santiago, Chile.

>**enable**
#clock timezone -4-Santiago

configure

Use the **configure** command to enter the Global Configuration mode or to configure the system from memory. Refer to *Global Configuration Mode Command Set on page 1149* for more information. Variations of this command include:

configure memory
configure network
configure overwrite-network
configure terminal

Syntax Description

memory	Configures the active system with the commands located in the default configuration file stored in nonvolatile random access memory (NVRAM).
network	Configures the system from a Trivial File Transfer Protocol (TFTP) network host.
overwrite-network	Overwrites NVRAM memory from a TFTP network host.
terminal	Enters the Global Configuration mode.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example enters the Global Configuration mode from the Enable mode:

```
>enable
#configure terminal
(config)#
```

copy

Use the **copy** command to copy the specified file from the source (flash memory) to the specified destination.

Variations of this command (valid only on AOS units WITHOUT CompactFlash®) include:

copy <*source file*> <*new file*>
copy <*source file*> **boot**
copy <*source file*> **default-config**
copy <*source file*> **fpga**
copy <*source file*> **interface** <*interface*>
copy <*source file*> **startup-config**

Syntax Description

<*source file*>	Specifies the name of the file to copy.
<*new file*>	Makes a copy of the specified source file and saves it in flash memory using the specified new name.
boot	Copies the specified source file and overwrites the boot read only memory (ROM).
default-config	Replaces the default configuration with the specified file copied from flash memory.
fpga	Updates the field-programmable gate array (FPGA) using a copy of the specified file.
interface <*interface*>	Updates the specified interface using a copy of the specified file. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **copy** <*source file*> **interface ?** to display a list of valid interfaces.
startup-config	Replaces the startup configuration with the specified file copied from flash memory.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **default-config**.
Release 17.2	Command was expanded to include the cellular interface.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Release A4.05	Command was expanded to include the asymmetric digital subscriber line (ADSL) interface.
Release A5.01	Command was expanded to include the **fpga** parameter.
Release R12.1.0	Command version **copy** <*source file*> **boot** was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

Updates to the boot ROM are required periodically to enhance and expand the unit's operation. The bootcode can be updated from within the command line interface (CLI) using the **copy** <*source file*> **boot** command.

The **copy** <*source file*> **boot** command is not available on vAOS instances.

Usage Examples

The following example copies the file **myfile.biz** (located in flash memory) and overwrites the boot ROM:

>**enable**
#copy myfile.biz boot
Upgrading bootcode is a critical process that cannot be interrupted. If something were to happen and the process was not able to be completed, it would render your unit inoperable. It is for this reason that during a bootcode upgrade, all other system tasks will be halted. This means packets will not be routed, and all console sessions will not respond during the upgrade process. Once the process finishes, the system will function as it did before. This process will take approximately 20 seconds.
Do you want to proceed? [yes/no]y

WARNING!! A bootcode upgrade has been initiated. Your session will become nonresponsive for the duration of the upgrade (approx. 20 seconds). A message will be sent when the upgrade is completed.

Bootcode upgrade process done. Your session should function normally.

Success!!!!!

copy cflash

Use the **copy cflash** command to copy files located on the CompactFlash® card to the specified destination.

The following variations of this command are valid only on AOS units with CompactFlash:

copy cflash <*source file*> **boot**
copy cflash <*source file*> **cflash** <*new file*>
copy cflash <*source file*> **flash**
copy cflash <*source file*> **flash** <*new file*>
copy cflash <*source file*> **http** <*url*>
copy cflash <*source file*> **http** <*url*> **port** <*port*>
copy cflash <*source file*> **http** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy cflash <*source file*> **http** <*url*> **username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.0**
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1**
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy cflash <*source file*> **https** <*url*> **allow-tls1.1**
copy cflash <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3**
copy cflash <*source file*> **https** <*url*> **allow-sslv3**
copy cflash <*source file*> **https** <*url*> **username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3**
copy cflash <*source file*> **https** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>

copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3 username** <*username*> **password** <*password*>
copy cflash <*source file*> **interface** <*interface*>
copy cflash <*source file*> **startup-config**
copy cflash tftp
copy cflash xmodem

Syntax Description

<*new file*>	Specifies the new file name.
<*source file*>	Specifies the name of the source file to copy.
boot	Copies the specified source file and overwrites the boot read only memory (ROM).
cflash	Specifies the location of the specified source file or the location of the new file as the CompactFlash card.
flash	Specifies the location of the source file or the location of the new file as flash memory.
http <*url*>	Specifies transferring the copied source file to an Hypertext Transfer Protocol (HTTP) server using the HTTP PUT operation. The HTTP server uniform resource locator (URL) provides the location.
https <*url*>	Specifies transferring the source file to a secure socket Hypertext Transfer Protocol Secure (HTTPS) server using the HTTPS PUT operation. The HTTPS server URL provides the location.
allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when transferring the source file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 when transferring the source file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when transferring source files. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.

interface <*interface*>	Updates the specified interface using a copy of the specified file. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **copy cflash** <*source file*> **interface ?** to display a list of valid interfaces.
password <*password*>	Optional. Specifies a password for HTTP or HTTPS authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
startup-config	Replaces the startup configuration with the specified file copied from the CompactFlash card.
tftp	Copies any file on the CompactFlash card to a specified Trivial File Transfer Protocol (TFTP) server. After **copy cflash tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server. *Source filename:* Specifies the name of the file to copy to the TFTP server. *Destination filename:* Specifies the file name to use when storing the copied file on the TFTP server. (The file will be placed in the default directory established by the TFTP server.)
username <*username*>	Optional. Specifies a user name for HTTP or HTTPS authentication.
xmodem	Copies any file on the CompactFlash card (using the XMODEM protocol) to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal. After **copy cflash xmodem** is entered, the following prompts require additional information: *Source filename:* Specifies the name of the file to copy from CompactFlash to the connected terminal.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include HTTP and HTTPS.
Release 17.2	Command was expanded to include the cellular interface.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Release A4.05	Command was expanded to include the asymmetric digital subscriber line (ADSL) interface.
Release R10.5.0	Command was expanded to include the **username** and **password** parameters.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example copies the source file **myfile.biz** (located on the CompactFlash card) to flash memory and names the new file **newfile.biz**:

>**enable**
#copy cflash myfile.biz flash newfile.biz

The following example creates a copy of the file **myfile.biz** (located on the CompactFlash card), names the new file **newfile.biz**, and places the new file on the installed CompactFlash card:

>**enable**
#copy cflash myfile.biz cflash newfile.biz

The following example replaces the startup configuration file with the file **newconfig.txt**:

>**enable**
#copy cflash newconfig.txt startup-config

The following example copies the file **myfile.biz** (located on the CompactFlash card) to the specified TFTP server:

>**enable**
#copy cflash tftp
Address of remote host?**10.200.2.4**
Source filename **myfile.biz**
Destination filename **myfile.biz**
Initiating TFTP transfer...
Received 45647 bytes.
Transfer Complete!

>**enable**
#copy cflash xmodem
Source filename **myfile.biz**
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to transmit the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Receive File** and select the destination. Once the transfer is complete, information similar to the following is displayed:

Received 231424 bytes.
Transfer complete

copy console

Use the **copy console** command to copy the console's input to a text file. To stop copying to the text file, type **<Ctrl+D>**. The file will be saved in the AOS root directory.

Variations of this command (valid only on AOS units without CompactFlash® capability) include:

copy console *<filename>*
copy console flash *<filename>*
copy console flash *<filename>* **force-overwrite**
copy console flash startup-config
copy console flash startup-config force-overwrite
copy console startup-config
copy console startup-config force-overwrite

Variations of this command (valid only on AOS units with CompactFlash capability) include:

copy console cflash *<filename>*
copy console cflash *<filename>* **force-overwrite**

Variations of this command (valid only on AOS units with Universal Serial Bus (USB) flash drive capability) include:

copy console usbdrive0 *<filename>*
copy console usbdrive0 *<filename>* **force-overwrite**

Syntax Description

<filename>	Copies the console input and saves it to flash memory using the specified file name.
startup-config	Copies the console input and saves it to flash memory as the startup configuration.
cflash *<filename>*	Copies the console input and saves it to CompactFlash memory using the specified file name.
flash *<filename>*	Copies the console input and saves it to flash memory using the specified file name.
force-overwrite	Optional. Specifies a force override to copy the file.
usbdrive0 *<filename>*	Copies the console input and saves it to USB flash drive memory using the specified file name.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 18.2	Command was expanded to include USB flash drive memory.

Release R10.1.0	Command was expanded to include the **cflash** keyword.
Release R12.2.0	Command was expanded to include the **startup-config** parameter.

Functional Notes

The **copy console** command works much like a line editor. Prior to pressing **<Enter>**, changes can be made to the text on the line. Changes can be made using **<Delete>** and **<Backspace>** keys. The text can be traversed using the arrow keys, **<Ctrl+A>** (to go to the beginning of a line), and **<Ctrl+E>** (to go to the end of a line). To end copying to the text file, type **<Ctrl+D>.** The file will be saved in the AOS root directory. Use the **dir** command to see a list of files in the root directory.

Usage Examples

The following example copies the console input into the file **config.txt** (located in the AOS root directory):

>**enable**
#copy console flash config.txt

copy dynvoice-config

Use the **copy dynvoice-config** command to copy the dynamic voice configuration file to the specified destination.

The following variations of this command are valid only on AOS units with CompactFlash® and voice capability:

copy dynvoice-config cflash <*filename*>
copy dynvoice-config flash <*filename*>
copy dynvoice-config http <*url*>
copy dynvoice-config http <*url*> **port** <*port*>
copy dynvoice-config http <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy dynvoice-config http <*url*> **username** <*username*> **password** <*password*>
copy dynvoice-config https <*url*>
copy dynvoice-config https <*url*> **port** <*port*>
copy dynvoice-config https <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy dynvoice-config https <*url*> **username** <*username*> **password** <*password*>
copy dynvoice-config running-config
copy dynvoice-config tftp
copy dynvoice-config xmodem

Syntax Description

cflash <*filename*>	Copies the dynamic voice configuration file and saves it to the CompactFlash card using the specified file name.
flash <*filename*>	Copies the dynamic voice configuration file and saves it to flash memory using the specified file name.
http <*url*>	Specifies the Hypertext Transfer Protocol (HTTP) server uniform resource locator (URL) to which to transfer the dynamic voice configuration file using the HTTP PUT operation.
https <*url*>	Specifies the secure socket Hypertext Transfer Protocol (HTTPS) server uniform resource locator (URL) to which to transfer the dynamic voice configuration file using the HTTPS PUT operation.
password <*password*>	Optional. Specifies a password for HTTP or HTTPS authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
running-config	Replaces the active running configuration with a copy of the dynamic voice configuration file.
tftp	Specifies the Trivial File Transfer Protocol (TFTP) server to which to copy the dynamic voice configuration file. After **copy dynvoice-config tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server. *Source filename:* Specifies the name of the file (located on the CompactFlash card) to copy to the TFTP server.

	Destination filename:	Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
username <*username*>	Optional. Specifies a user name for HTTP or HTTPS authentication.	
xmodem	Copies the dynamic voice configuration file (using the XMODEM protocol) and saves it to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal. After **copy dynvoice-config xmodem** is entered, the following prompts require additional information:	
	Source filename:	Specifies the name of the file to copy from CompactFlash to the connected terminal.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include the **http** parameter.
Release R10.5.0	Command was expanded to include the **https**, **port**, **username**, and **password** parameters.

Usage Examples

The following example copies the dynamic voice configuration file and saves it to the CompactFlash card using the name **myvoice-config**:

>**enable**
#copy dynvoice-config cflash myvoice-config
Percent Complete 100%

The following example copies the dynamic voice configuration file and saves it to flash memory using the name **myvoice-config**:

>**enable**
#copy dynvoice-config flash myvoice-config
Percent Complete 100%

The following example replaces the active running configuration with a copy of the dynamic voice configuration file:

>**enable**
#copy dynvoice-config running-config
Percent Complete 100%

The following example copies the dynamic voice configuration file and saves it to the TFTP server:

>**enable**
#copy dynvoice-config tftp
Address of remote host? **10.200.2.4**
Destination filename? **myvoice-config**
Initiating TFTP transfer...
Sent 5221 bytes.
Transfer complete.

copy flash

Use the **copy flash** command to copy files located in flash memory to a specified destination. Certain variations of this command are available only on specific AOS units and are explained below.

The following variations of this command are valid on all AOS units:

copy flash <*source file*> **http** <*url*> **port** <*port*>
copy flash <*source file*> **http** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy flash <*source file*> **http** <*url*> **username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*>
copy flash <*source file*> **https** <*url*> **allow-tls1.0**
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1**
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-sslv3**
copy flash <*source file*> **https** <*url*> **allow-tls1.1**
copy flash <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3**
copy flash <*source file*> **https** <*url*> **allow-sslv3**
copy flash <*source file*> **https** <*url*> **username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3**
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3**
copy flash <*source file*> **https** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>

copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3 username** <*username*> **password** <*password*>
copy flash <*source file*> **scp** <*url*>
copy flash <*source file*> **scp** <*url*> myprivkey <*private key for authentication*>
copy flash <*source file*> **scp** <*url*> **myprivkey dsa**
copy flash <*source file*> **scp** <*url*> **myprivkey ecdsa256**
copy flash <*source file*> **scp** <*url*> **myprivkey ecdsa384**
copy flash <*source file*> **scp** <*url*> **myprivkey ecdsa521**
copy flash <*source file*> **scp** <*url*> **myprivkey rsa**
copy flash <*source file*> **scp** <*url*> **myprivkey rsa-sha2-512**
copy flash <*source file*> **scp** <*url*> **privkey** <*filename*>
copy flash <*source file*> **scp** <*url*> **password** <*password*>
copy flash <*source file*> **scp** <*url*> **port** <*port*>
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey** <*private key for authentication*>
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey dsa**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa256**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa384**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa521**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey rsa**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **myprivkey rsa-sha2-512**
copy flash <*source file*> **scp** <*url*> **port** <*port*> **privkey** <*private key for authentication*>
copy flash <*source file*> **scp** <*url*> **port** <*port*> **password** <*password*>
copy flash <*source file*> **sftp** <*url*>
copy flash <*source file*> **sftp** <*url*> **myprivkey** <*private key for authentication*>
copy flash <*source file*> **sftp** <*url*> **myprivkey dsa**
copy flash <*source file*> **sftp** <*url*> **myprivkey ecdsa256**
copy flash <*source file*> **sftp** <*url*> **myprivkey ecdsa384**
copy flash <*source file*> **sftp** <*url*> **myprivkey ecdsa521**
copy flash <*source file*> **sftp** <*url*> **myprivkey rsa**
copy flash <*source file*> **sftp** <*url*> **myprivkey rsa-sha2-512**
copy flash <*source file*> **sftp** <*url*> **privkey** <*private key for authentication*>
copy flash <*source file*> **sftp** <*url*> **password** <*password*>
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey** <*private key for authentication*>
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey dsa**
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey ecdsa256**
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey ecdsa384**
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey ecdsa521**
copy flash <*source file*> **sftp** <*url*> **port** <*port*> **myprivkey rsa**

copy flash <*source file*> **sftp** <*url*> **port** <*port*> **privkey** <*filename*>
copy flash <*source file*> **sftp** <*url*> **port password** <*password*>
copy flash tftp

copy flash xmodem
copy flash <*filename*>

The following variations of this command are valid only on AOS units with CompactFlash® capability:

copy flash <*source file*> **boot**
copy flash <*source file*> **cflash**
copy flash <*source file*> **cflash** <*new file*>
copy flash <*source file*> **flash** <*new file*>
copy flash <*source file*> **interface** <*interface*>
copy flash <*source file*> **startup-config**

The following variations of this command are valid only on AOS units with CompactFlash and voice capability:

copy flash <*source file*> **dynvoice-config**

The following variations of this command are valid only on AOS units with **ramdisk** enabled:

copy flash <*source file*> **ramdisk**
copy flash <*source file*> **ramdisk** <*new file*>

The following variations of this command are valid only on AOS units with Universal Serial Bus (USB) flash drive capability:

copy flash <*source file*> **usbdrive0**
copy flash <*source file*> **usbdrive0** <*new file*>

The following variations of this command are valid only on AOS units with field-programmable gate arrays (FPGAs):

copy flash <*source file*> **fpga**

Syntax Description

<*new file*>	Saves the file using the specified file name.
<*source file*>	Specifies the name of the file to copy.
boot	Copies the specified source file and overwrites the boot read only memory (ROM).
cflash	Copies a file and saves it to the CompactFlash card.
dynvoice-config	Replaces the dynamic voice configuration file with the specified file copied from flash memory.
flash	Copies the specified file and saves it to flash memory.
fpga	Copies the specified file and saves it as the FPGA image.
http <*url*>	Specifies the Hypertext Transfer Protocol (HTTP) server uniform resource locator (URL) to which to transfer the source file using the HTTP PUT operation.

https <*url*>	Specifies the secure socket Hypertext Transfer Protocol (HTTPS) server uniform resource locator (URL) to which to transfer the source file using the HTTPS PUT operation.
allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when transferring the source file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 when transferring the source file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when transferring source files. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.
interface <*interface*>	Updates the specified interface using a copy of the specified file. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **copy flash** <*source file*> **interface ?** to display a list of valid interfaces.
myprivkey	Optional. Specifies the AOS unit's private key is used for SSH authentication.
dsa	Optional. Specifies to use the unit's Digital Signature Algorithm (DSA) private key for SSH authentication.
rsa	Optional. Specifies to use the unit's Rivest-Shamir-Adleman (RSA) private key for SSH authentication.
ecdsa	Optional. Specifies to use the unit's ECDSA nistp256|384|521 private key for SSH authentication.
password <*password*>	Optional. Specifies a password for HTTP, HTTPS, or SSH authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP, HTTPS, server. Range is **0** to **65335**.
privkey <*filename*>	Optional. Specifies the filename of a 3rd party private key file for SSH authentication in privacy enhanced email (PEM) format.
ramdisk	Copies a file and saves it to the volatile RAM disk.
scp <*url*>	Specifies the Secure Copy Protocol (SCP) server Uniform Resource Locator (URL) to which to transfer the source file. Specify the URL in the following format:**user@server:/path/filename.**
sftp <*url*>	Specifies the Secure File Transfer Protocol server Uniform Resource Locator (URL) to which to transfer the source file. Specify the URL in the following format:**user@server:/path/filename.**
startup-config	Replaces the startup configuration file with a copy of the specified file.
tftp	Copies any file located in flash memory to a specified Trivial File Transfer Protocol (TFTP) server. After **copy flash tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server.

	Source filename:	Specifies the name of the file (located in flash memory) to copy to the TFTP server.
	Destination filename:	Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
usbdrive0	Specifies saving the file to USB flash drive memory.	
username <*username*>	Optional. Specifies a user name for HTTP or HTTPS authentication.	
xmodem	Copies any file located in flash memory (using the XMODEM protocol) to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal.	
	After **copy flash xmodem** is entered, the following prompts require additional information:	
	Source filename:	Specifies the name of the file to copy from system flash memory using XMODEM.

Default Values

No default values are necessary for this command.

Command History

Release R14.4.0	Added **copy flash scp** and **sftp** options from local to remote server **with vrf** and **without vrf**.

Functional Notes

The **myprivkey** keyword specifies to use the unit's private key for SSH authentication. This is the key generated using the command **ssh key regenerate sftp**. Use the **privkey** keyword if you are using 3rd party keys instead of the keys generated by the unit.

Usage Examples

The following example creates a copy of the file **myfile.biz** (located in flash memory), names the new file **newfile.biz**, and places the new file in flash memory:

```
>enable
#copy flash myfile.biz flash newfile.biz
```

The following example copies the file **myfile.biz** (located in flash memory) to CompactFlash memory and names the new file **newfile.biz**:

```
>enable
#copy flash myfile.biz cflash newfile.biz
```

The following example copies the file **new_startup_config.txt** (located in flash memory) to the startup configuration:

```
>enable
#copy flash new_startup_config.txt startup-config
```

The following example copies the file **myfile.biz** (located in flash memory) to a TFTP server:

>**enable**
#copy flash tftp
Address of remote host? **10.200.2.4**
Source filename? **myfile.biz**
Destination filename? **myfile.biz**
Initiating TFTP transfer...
Sent 769060 bytes.
Transfer Complete!

The following example copies the file **startup-config.txt** to the SSH server **adtran@10.200.2.4:/backup/start** using a DSA private key generated in AOS.

>**enable**
#copy flash startup-config.txt sftp adtran@10.200.2.4:/backup/start myprivkey dsa
Initiating SFTP transfer...
Transferred 5510 bytes in 1 secs. (5.380 KB/sec)
Transfer complete.

The following example copies the file **myfile.biz** (located in flash memory) to USB flash drive memory and names the new file **newfile.biz**:

>**enable**
#copy flash myfile.biz usbdrive0 newfile.biz

The following example copies the file **myfile.biz** (located in flash memory) to the connected terminal using XMODEM protocol:

>**enable**
#copy flash xmodem
Source filename? **myfile.biz**
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to transmit the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Receive File** and select the destination. Once the transfer is complete, information similar to the following is displayed:

Sent 231424 bytes.
Transfer complete

copy http

Use the **copy http** command to copy a file located on a network Hypertext Transfer Protocol (HTTP) server to a specified destination. Certain variations of this command are available only on specific AOS units and are explained below.

The following variations of this command are valid on all AOS units:

copy http <*url*> **flash** <*destination file*>
copy http <*url*> **flash** <*destination file*> **username** <*username*> **password** <*password*>
copy http <*url*> **flash** <*destination file*> **force-overwrite**
copy http <*url*> **flash** <*destination file*> **force-overwrite port** <*port*>
copy http <*url*> **flash** <*destination file*> **force-overwrite port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **flash** <*destination file*> **force-overwrite username** <*username*> **password** <*password*>
copy http <*url*> **flash** <*destination file*> **port** <*port*>
copy http <*url*> **flash** <*destination file*> **port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **running-config**
copy http <*url*> **running-config username** <*username*> **password** <*password*>
copy http <*url*> **running-config port** <*port*>
copy http <*url*> **running-config port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **startup-config**
copy http <*url*> **startup-config username** <*username*> **password** <*password*>
copy http <*url*> **startup-config port** <*port*>
copy http <*url*> **startup-config port** <*port*> **username** <*username*> **password** <*password*>

The following variations of this command are valid only on AOS units with CompactFlash® capability:

copy http <*url*> **cflash** <*destination file*> **username** <*username*> **password** <*password*>
copy http <*url*> **cflash** <*destination file*>
copy http <*url*> **cflash** <*destination file*> **force-overwrite**
copy http <*url*> **cflash** <*destination file*> **force-overwrite port** <*port*>
copy http <*url*> **cflash** <*destination file*> **force-overwrite port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **cflash** <*destination file*> **force-overwrite username** <*username*> **password** <*password*>
copy http <*url*> **cflash** <*destination file*> **port** <*port*>
copy http <*url*> **cflash** <*destination file*> **port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **cflash running-config**
copy http <*url*> **cflash running-config port** <*port*>

The following variations of this command are valid only on AOS units with CompactFlash and voice capability:

copy http <*url*> **dynvoice-config**
copy http <*url*> **dynvoice-config port** <*port*>
copy http <*url*> **dynvoice-config port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **dynvoice-config username** <*username*> **password** <*password*>

The following variations of this command are valid only on AOS units with **ramdisk** enabled:

copy http <*url*> **ramdisk** <*destination file*>
copy http <*url*> **ramdisk** <*destination file*> **username** <*username*> **password** <*password*>
copy http <*url*> **ramdisk** <*destination file*> **force-overwrite**
copy http <*url*> **ramdisk** <*destination file*> **force-overwrite port** <*port*>
copy http <*url*> **ramdisk** <*destination file*> **force-overwrite port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **ramdisk** <*destination file*> **force-overwrite username** <*username*> **password** <*password*>
copy http <*url*> **ramdisk** <*destination file*> **port** <*port*>
copy http <*url*> **ramdisk** <*destination file*> **port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **ramdisk running-config**
copy http <*url*> **ramdisk running-config port** <*port*>

The following variations of this command are valid only on AOS units with Universal Serial Bus (USB) flash drive capability:

copy http <*url*> **usbdrive0** <*destination file*>
copy http <*url*> **usbdrive0** <*destination file*> **username** <*username*> **password** <*password*>
copy http <*url*> **usbdrive0** <*destination file*> **force-overwrite**
copy http <*url*> **usbdrive0** <*destination file*> **force-overwrite username** <*username*> **password** <*password*>
copy http <*url*> **usbdrive0** <*destination file*> **force-overwrite port** <*port*>
copy http <*url*> **usbdrive0** <*destination file*> **force-overwrite port** <*port*> **username** <*username*> **password** <*password*>
copy http <*url*> **usbdrive0** <*destination file*> **port** <*port*>
copy http <*url*> **usbdrive0** <*destination file*> **port** <*port*> **username** <*username*> **password** <*password*>

Syntax Description

<*destination file*>	Specifies the new name of the file after it is copied.
cflash	Copies a file from the HTTP server to the CompactFlash card.
dynvoice-config	Specifies that the file copied from the HTTP server overwrite the dynamic voice configuration file.
flash	Specifies the flash memory as the destination for the copied file.
force-overwrite	Optional. Specifies a force override to copy the file.
http <*url*>	Specifies the URL of the HTTP server.
password <*password*>	Optional. Specifies a password for HTTP authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file from an HTTP server. Range is **0** to **65335**.
ramdisk	Copies a file from the HTTP server to the volatile RAM disk.
running-config	Replaces the active running configuration file with the file copied from the HTTP server.
startup-config	Replaces the startup configuration file with the file copied from the HTTP server.

username <*username*>	Optional. Specifies a user name for HTTP authentication.
usbdrive0	Specifies the USB flash drive memory as the destination for the copied file.

Default Values

By default, the **port** value is **80**.

Command History

Release 16.1	Command was introduced.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include the USB flash drive memory.
Release R10.5.0	Command was expanded to include the **username** and **password** parameters.

Usage Examples

The following example replaces the current running configuration file with **newconfig.txt** from the HTTP server (**10.200.2.4**):

```
#copy http http://10.200.2.4/newconfig.txt running-config
Initiating HTTP transfer...
Received 4562 bytes.
Transfer Complete!
#
```

The following example copies the file **myfile.biz** from the HTTP server (**10.200.2.4**) and saves it to CompactFlash memory (naming the copy **newfile.biz**):

```
#copy http http://10.200.2.4/SomeDirectory/AnotherDirectory/myfile.biz cflash newfile.biz
Initiating HTTP transfer...
Received 45647 bytes.
Transfer Complete!
```

copy https

Use the **copy https** command to copy a file located on a secure socket Hypertext Transfer Protocol Secure (HTTPS) server to a specified destination using the HTTPS PUT operation. Certain variations of this command are available only on specific AOS units and are explained below.

The following variations of this command are valid on all AOS units:

copy https <*url*> **flash** <*destination file*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.0**
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-tls1.1**
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-sslv3**
copy https <*url*> **flash** <*destination file*> **allow-tls1.1**
copy https <*url*> **flash** <*destination file*> **allow-tls1.1 allow-sslv3**
copy https <*url*> **flash** <*destination file*> **allow-sslv3**
copy https <*url*> **flash** <*destination file*> **username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **allow-sslv3 username** <*username*> **password** <*password*>
copy https <*url*> **flash** <*destination file*> **force-overwrite**

copy https <*url*> **ramdisk running-config**
copy https <*url*> **ramdisk running-config port** <*port*>

The following variations of this command are valid only on AOS units with Universal Serial Bus (USB) flash drive capability:

copy https <*url*> **usbdrive0** <*destination file*>
copy https <*url*> **usbdrive0** <*destination file*> **username** <*username*> **password** <*password*>
copy https <*url*> **usbdrive0** <*destination file*> **force-overwrite**
copy https <*url*> **usbdrive0** <*destination file*> **force-overwrite username** <*username*> **password** <*password*>
copy https <*url*> **usbdrive0** <*destination file*> **force-overwrite port** <*port*>
copy https <*url*> **usbdrive0** <*destination file*> **force-overwrite port** <*port*> **username** <*username*> **password** <*password*>
copy https <*url*> **usbdrive0** <*destination file*> **port** <*port*>
copy https <*url*> **usbdrive0** <*destination file*> **port** <*port*> **username *<username>* password *<password>***

Syntax Description

allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when copying the file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 when copying the file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when copying the file. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.
<*destination file*>	Specifies the new name of the file after it is copied.
cflash	Specifies the CompactFlash card as the destination for the copied file.
dynvoice-config	Specifies that the file copied from the HTTP secure server overwrite the dynamic voice configuration file.
flash	Specifies the flash memory as the destination for the copied file.

force-overwrite	Optional. Specifies a force override to copy the file.
https <*url*>	Specifies the URL of the HTTP secure server.
password <*password*>	Optional. Specifies a password to use with HTTPS authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file from an HTTP secure server. Range is **0** to **65335**.
ramdisk	Specifies the volatile RAM disk as the destination for the copied file.
running-config	Replaces the active running configuration with the file copied from the HTTP secure server.
startup-config	Replaces the startup configuration file with the file copied from the HTTP secure server.
usbdrive0	Specifies the USB flash drive memory as the destination for the copied file.
username <*username*>	Optional. Specifies a user name to use with HTTPS authentication.

Default Values

By default, the **port** value is **443**.

Command History

Release 16.1	Command was introduced.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.
Release R10.5.0	Command was expanded to include the **password** and **username** parameters.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example replaces the current running configuration file with **newconfig.txt** from the HTTPS server (**MyWebServer**):

```
#copy https https://MyWebServer.com/newconfig.txt running-config
Initiating HTTPS transfer...
Received 4562 bytes.
Transfer Complete!
#
```

The following example copies the file **myfile.biz** from the HTTPS server (**10.200.2.4**) and saves it to CompactFlash memory (naming the copy **newfile.biz**):

```
#copy https https://10.200.2.4/myfile.biz cflash newfile.biz
Initiating HTTPS transfer...
Received 45647 bytes.
Transfer Complete!
```

copy ramdisk

Use the **copy ramdisk** command to copy files located in the volatile RAM disk memory to a specified destination. Variations of this command include:

copy ramdisk <*source file*> **flash**
copy ramdisk <*source file*> **flash** <*new file*>
copy ramdisk <*source file*> **http** <*url*>
copy ramdisk <*source file*> **http** <*url*> **username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **http** <*url*> **port** <*port*>
copy ramdisk <*source file*> **http** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0**
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1**
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.1**
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3**
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3 username** <*username*>

password <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **https** <*url*> **port** <*port*> **allow-sslv3 username** <*username*> **password** <*password*>
copy ramdisk <*source file*> **overwrite primary**
copy ramdisk <*source file*> **overwrite primary verify**
copy ramdisk <*source file*> **overwrite secondary**
copy ramdisk <*source file*> **overwrite secondary verify**
copy ramdisk tftp
copy ramdisk xmodem

Not all units are capable of using a RAM disk file system. Use the ***copy ?*** *command to display a list of valid commands at the enable prompt.*

Syntax Description

<*new file*>	Specifies the new file name.
<*source file*>	Specifies the name of the source file to copy.
flash	Specifies the location to copy the new file as the system flash memory.
http <*url*>	Specifies the Hypertext Transfer Protocol (HTTP) server uniform resource locator (URL) to which to transfer the source file using the HTTP PUT operation.
https <*url*>	Specifies the secure socket Hypertext Transfer Protocol (HTTPS) server uniform resource locator (URL) to which to transfer the source file using the HTTPS PUT operation.
allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when transferring the source file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 when transferring the source file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when transferring the source file. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.
overwrite primary	Replaces the primary boot image file with the file from RAM disk. The file to be overwritten is deleted prior to copying the new file. In order for this command to succeed, the RAM disk must be mounted, the specified file must exist, and the specified file must verify with a valid signature for the unit.

overwrite secondary	Replaces the secondary boot image file with the file from RAM disk. The file to be overwritten is deleted prior to copying the new file. In order for this command to succeed, the RAM disk must be mounted, the specified file must exist, and the specified file must verify with a valid signature for the unit.
password <*password*>	Optional. Specifies a password for HTTP or HTTPS authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
tftp	Copies the specified file from the RAM disk to a specified Trivial File Transfer Protocol (TFTP) server. After the command is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server. *Source filename:* Specifies the name of the file (located on the RAM disk) to copy to the TFTP server. *Destination filename:* Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
username <*username*>	Optional. Specifies a user name to use with HTTP or HTTPS authentication.
verify	Optional. Specifies that a second verification of the new primary or secondary boot system image is performed after it is copied.
xmodem	Copies the specified file from the RAM disk (using the XMODEM protocol) to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal. After the command is entered, the following prompts require additional information: *Source filename:* Specifies the name of the file (located on the RAM disk) to copy using XMODEM.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced.
Release R10.5.0	Command was expanded to include the following parameters: **http**, **https**, **port**, **username**, and **password**.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example creates a copy of the file **myfile.biz** (located on the RAM disk), names the new file **newfile.biz**, and places the new file in flash memory:

>**enable**
#copy ramdisk myfile.biz flash newfile.biz

The following example copies the software file **myfile.biz** (located on the RAM disk) to a TFTP server:

>**enable**
#copy ramdisk tftp
Address of remote host? **10.200.2.4**
Source filename? **myfile.biz**
Destination filename? **myfile.biz**
Initiating TFTP transfer...
Sent 769060 bytes.
Transfer Complete!
The following example copies the software file **myfile.biz** (located on the RAM disk) to the connected terminal using XMODEM protocol:

>**enable**
#copy ramdisk xmodem
Source filename? **myfile.biz**
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to transmit the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Receive File** and select the destination. Once the transfer is complete, information similar to the following is displayed:

Sent 231424 bytes.
Transfer complete

copy running-config

Use the **copy running-config** command to create a copy of the current running configuration and replace the current startup configuration or save it to a specified location. Certain variations of this command are available only on specific AOS units and are explained below.

The following variations of this command are valid on all AOS units:

copy running-config <*filename*>
copy running-config http <*url*>
copy running-config http <*url*> **username** <*username*> **password** <*password*>
copy running-config http <*url*> **port** <*port*>
copy running-config http <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy running-config https <*url*>
copy running-config https <*url*> **allow-tls1.0**
copy running-config https <*url*> **allow-tls1.0 allow-tls1.1**
copy running-config https <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy running-config https <*url*> **allow-tls1.0 allow-sslv3**
copy running-config https <*url*> **allow-tls1.1**
copy running-config https <*url*> **allow-tls1.1 allow-sslv3**
copy running-config https <*url*> **allow-sslv3**
copy running-config https <*url*> **username** <*username*> **password** <*password*>
copy running-config https <*url*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy running-config https <*url*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy running-config https <*url*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy running-config https <*url*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy running-config https <*url*> **allow-sslv3 username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.0**
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1**
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3**
copy running-config https <*url*> **port** <*port*> **allow-sslv3**
copy running-config https <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-tls1.1 allow-sslv3 username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.0 allow-sslv3 username** <*username*> **password** <*password*>
copy running-config https <*url*> **port** <*port*> **allow-tls1.1 username** <*username*> **password** <*password*>

copy running-config https *<url>* **port** *<port>* **allow-tls1.1 allow-sslv3 username** *<username>* **password** *<password>*
copy running-config https *<url>* **port** *<port>* **allow-sslv3 username** *<username>* **password** *<password>*
copy running-config tftp
copy running-config xmodem

The following variations of this command are valid only on AOS units with CompactFlash® capability:

copy running-config cflash *<filename>*
copy running-config cflash startup-config
copy running-config flash *<filename>*
copy running-config flash startup-config

The following variations of this command are valid only on AOS units with CompactFlash and voice capability:

copy running-config dynvoice-config
copy running-config dynvoice-config tftp
copy running-config dynvoice-config http *<url>*
copy running-config non-dynvoice-config http *<url>*

The following variations of this command are valid only on AOS units with **ramdisk** enabled:

copy running-config ramdisk *<filename>*

The following variations of this command are valid only on AOS units with Universal Serial Bus (USB) flash drive capability:

copy running-config usbdrive0 *<filename>*
copy running-config usbdrive0 startup-config

Syntax Description

<filename>	Specifies the filename to use when saving the configuration file.
cflash	Specifies the location so save the current running configuration as the CompactFlash card.
dynvoice-config	Copies the current active voice running configuration and saves it to the dynamic voice configuration file.
flash	Specifies saving the current running configuration to flash memory.
http *<url>*	Specifies the Hypertext Transfer Protocol (HTTP) server uniform resource locator (URL) to which to transfer the configuration file using the HTTP PUT operation.
https *<url>*	Specifies the secure socket Hypertext Transfer Protocol (HTTPS) server uniform resource locator (URL) to which to transfer the configuration file using the HTTPS PUT operation.

allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when transferring the configuration file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS version 1.1 when transferring the configuration file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when transferring the configuration file. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.
non-dynvoice-config	Copies the current nondynamic portion of the voice running configuration and saves it to the nondynamic voice configuration file.
password <*password*>	Optional. Specifies a password for HTTP or HTTPS authentication.
port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
ramdisk	Copies the current running configuration to the volatile RAM disk.
startup-config	Replaces the startup configuration (located in either CompactFlash or system flash) with a copy of the current running configuration.
tftp	Copies the current running configuration or newly stored dynamic voice configuration file to the specified Trivial File Transfer Protocol (TFTP) server. After **copy running-config tftp** or **copy running-config dynvoice-config tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server. *Destination filename:* Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
usbdrive0	Copies the current running configuration to the USB flash drive memory.
username <*username*>	Optional. Specifies a user name to use with HTTP or HTTPS authentication.
xmodem	Copies the current running configuration (using the XMODEM protocol) to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include **HTTP** and **HTTPS**.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.
Release R10.5.0	Command was expanded to include the **port**, **username**, and **password** parameters.

Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example copies the current running configuration to the startup configuration file located in flash memory:

>**enable**
#copy running-config flash startup-config
Building configuration...
Done. Success!

The following example copies the current running configuration to CompactFlash memory and names the file **config_01.txt**:

>**enable**
#copy running-config cflash config_01.txt
Percent Compete 100%
#

The following example copies the current running configuration to a TFTP server and names the file **config_01.txt**:

>**enable**
#copy running-config tftp
Address of remote host? **10.200.2.4**
Destination filename? **config_01.txt**
Initiating TFTP transfer...
Sent 3099 bytes.
Transfer Complete!

The following example copies the current running configuration to the connected terminal using XMODEM protocol:

>**enable**
#copy running-config xmodem
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to transmit the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Receive File** and select the destination. Once the transfer is complete, information similar to the following is displayed:

Sent 3704 bytes.
Transfer complete!

copy scp

Use the **copy scp** command to securely copy a file using Secure Copy Protocol (SCP) from a secure shell (SSH) server. Variations of this command include:

copy scp <*url*> **flash** <*filename*>
copy scp <*url*> **flash** <*filename*> **force-overwrite**
copy scp <*url*> **flash** <*filename*> **force-overwrite myprivkey**
copy scp <*url*> **flash** <*filename*> **force-overwrite myprivkey dsa**
copy scp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa**
copy scp <*url*> **flash** <*filename*> **force-overwrite password** <*password*>
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*>
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey**
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey dsa**
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey rsa**
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **password** <*password*>
copy scp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **privkey** <*filename*>
copy scp <*url*> **flash** <*filename*> **force-overwrite privkey** <*filename*>
copy scp <*url*> **flash** <*filename*> **myprivkey** <*SSH Authentication key*>
copy scp <*url*> **flash** <*filename*> **myprivkey dsa**
copy scp <url> **flash** <*filename*> **myprivkey ecdsa256**
copy scp <url> **flash** <*filename*> **myprivkey ecdsa384**
copy scp <url> **flash** <*filename*> **myprivkey ecdsa521**
copy scp <*url*> **flash** <*filename*> **myprivkey rsa**
copy scp <*url*> **flash** <*filename*> **myprivkey rsa-sha2-512**
copy scp <url> **flash** <*filename*> **privkey** <*filename*>
copy scp <*url*> **flash** <*filename*> **password** <*password*>
copy scp <*url*> **flash** <*filename*> **port** <*port*>

copy scp <*url*>:<path> **flash** <*filename*> **myprivkey ecdsa256**
copy scp <*url*>:<path>**f lash** <*filename*> **myprivkey ecdsa384**
copy scp <*url*>:<path> **flash** <*filename*> **myprivkey ecdsa521**
copy scp <*url*>:<path> **flash** <*filename*> **myprivkey rsa**
copy scp <*url*>:<path>**f lash** <*filename*> **myprivkey rsa-sha2-512**
copy scp <*url*>:<path> **flash** <*filename*> **privkey** <*filename*>
copy scp <*url*>:<path> **password** <*password*>
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **myprivkey ecdsa256**
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **myprivkey ecdsa384**
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **myprivkey ecdsa521**
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **myprivkey rsa**
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **myprivkey rsa-sha2-512**
copy scp <*url*>:<path> **flash** <*filename*> **port** <*port*> **password**

copy scp <*url*>:<path> flash <filename>

The following variations of this command are valid only on AOS units with CompactFlash® capability:

copy scp <*url*> **cflash** <*filename*> **force-overwrite myprivkey dsa**
copy scp <*url*> **cflash** <*filename*> **force-overwrite myprivkey rsa**
copy scp <*url*> **cflash** <*filename*> **force-overwrite port** <*port*> **myprivkey dsa**
copy scp <*url*> **cflash** <*filename*> **force-overwrite port** <*port*> **myprivkey rsa**
copy scp <*url*> **cflash** <*filename*> **myprivkey dsa**
copy scp <*url*> **cflash** <*filename*> **myprivkey rsa**
copy scp <*url*> **cflash** <*filename*> **port** <*port*> **myprivkey dsa**
copy scp <*url*> **cflash** <*filename*> **port** <*port*> **privkey rsa**

Syntax Description

<*url*>	Specifies the source uniform resource locator (URL) on the remote server from which the file is copied. Specify the URL in the following format: **user@server: /path/filename**.
cflash	Specifies the file is copied securely to the CompactFlash card.
flash	Specifies the file is copied securely to the flash drive.
<*filename*>	Specifies the name of the file to copy from the SSH server.
force-overwrite	Optional. Specifies the copied file overwrites an existing file.
myprivkey	Optional. Specifies the AOS unit's private key is used for SSH authentication.
dsa	Optional. Specifies to use the unit's Digital Signature Algorithm (DSA) private key for SSH authentication.
rsa	Optional. Specifies to use the unit's Rivest-Shamir-Adleman (RSA) private key for SSH authentication.
password <*password*>	Optional. Specifies a password is used for SSH authentication.
port <*port*>	Optional. Specifies a port to use for the file transfer. Valid range is **1** to **65535**.
privkey <*filename*>	Optional. Specifies a private key is used for SSH authentication. The file name is the name of the private key file in privacy enhanced email (PEM) format.

Default Values

No default values are necessary for this command.

Command History

Release R14.4.0	Command was expanded to include <url>:<path>.

Usage Examples

The following example uses SCP to copy **FILE1** securely to flash from the SSH server **john@server1.** SSH authentication is performed using a password:

>**enable**
#copy scp john@server1:/FILE1 flash FILE1 password PSWD

copy sftp

Use the **copy sftp** command to securely copy a file using Secure File Transfer Protocol (SFTP) from a secure shell (SSH) server. Variations of this command include:

copy sftp <*url*> **flash** <*filename*>
copy sftp <*url*> **flash** <*filename*> **force-overwrite**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey dsa**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa-sha2-512**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa-ecdsa256**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa-ecdsa384**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa-ecdsa521**
copy sftp <*url*> **flash** <*filename*> **force-overwrite myprivkey rsa**
copy sftp <*url*> **flash** <*filename*> **force-overwrite privkey** <*filename*>
copy sftp <*url*> **flash** <*filename*> **force-overwrite password** <*password*>
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*>
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey dsa**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey rsa-sha2-512**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey ecdsa256**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey ecdsa384**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey ecdsa521**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey rsa**
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **password** <*password*>
copy sftp <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **privkey** <*filename*>
copy sftp <*url*> **flash** <*filename*> **myprivkey** <*SSH Authentication key*>
copy sftp <*url*> **flash** <*filename*> **myprivkey dsa**
copy sftp <url> **flash** <*filename*> **myprivkey ecdsa256**
copy sftp <url> **flash** <*filename*> **myprivkey ecdsa384**
copy sftp <url> **flash** <*filename*> **myprivkey ecdsa521**
copy sftp <*url*> **flash** <*filename*> **myprivkey rsa**
copy sftp <*url*> **flash** <*filename*> **myprivkey rsa-sha2-512**
copy sftp <url> **flash** <*filename*> **privkey** <*filename*>
copy sftp <*url*> **flash** <*filename*> **password** <*password*>
copy sftp <*url*> **flash** <*filename*> **port** <*port*>

Syntax Description

<*url*>	Specifies the source uniform resource locator (URL) on the remote server from which the file is copied. Specify the URL in the following format: **user@server: /path/filename**.
flash	Specifies the file is copied securely to the flash drive.
<*filename*>	Specifies the name of the file to copy from the SSH server.

force-overwrite	Optional. Specifies the copied file overwrites an existing file.
myprivkey	Optional. Specifies the AOS unit's private key is used for SSH authentication.
dsa	Optional. Specifies to use the unit's Digital Signature Algorithm (DSA) private key for SSH authentication.
rsa	Optional. Specifies to use the unit's Rivest-Shamir-Adleman (RSA) private key for SSH authentication.
ecdsa	Optional. Specifies to use unit's ECDSAnistp256|384|521 private keys for SSH authentication.
password <*password*>	Optional. Specifies a password is used for SSH authentication.
port <*port*>	Optional. Specifies a port to use for the file transfer. Valid range is **1** to **65535**.
privkey <*filename*>	Optional. Specifies a 3rd party private key is used for SSH authentication. The file name is the name of the private key file in privacy enhanced email (PEM) format.

Default Values

No default values are necessary for this command.

Command History

Release R13.11.0	Command was introduced.

Usage Examples

The following example uses SFTP to copy **FILE1** securely to flash from the SSH server **john@server1.** SSH authentication is performed using a password:

>**enable**
#copy sftp john@server1:/FILE1 flash FILE1 password PSWD

copy vrf

Use the **copy vrf** command to securely copy a file from a virtual routing and forwarding (VRF) instance. Variations of this command include:

copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey dsa**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey ecdsa256**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey ecdsa384**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey ecdsa521**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey rsa**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **myprivkey rsa-sha2-512**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **privkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **password**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey** dsa
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa256**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa384**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey ecdsa521**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey rsa**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **myprivkey rsa-sha2-512**
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **privkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **scp** <*url*> **port** <*port*> **password**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey dsa**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey ecdsa256**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey ecdsa384**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey ecdsa521**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey rsa**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **myprivkey rsa-sha2-512**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **privkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **password**
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **port** <*port*> **myprivkey** <*filename*>
copy vrf <*name*> **flash** <*filename*> **sftp** <*url*> **port** <*port*> **myprivkey** dsa

copy vrf <*name*> **scp** <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **myprivkey rsa-sha2-512**
copy vrf <*name*> **scp** <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **privkey** <*filename*>
copy vrf <*name*> **scp** <*url*> **flash** <*filename*> **force-overwrite port** <*port*> **password**

Syntax Description

<*filename*>	Specifies the name of the file to copy.
flash	Specifies the file is copied securely to the flash drive.
force-overwrite	Optional. Specifies the copied file overwrites an existing file.
myprivkey	Optional. Specifies the AOS unit's private key is used for SSH authentication.
dsa	Optional. Specifies to use the unit's Digital Signature Algorithm (DSA) private key for SSH authentication.
rsa	Optional. Specifies to use the unit's Rivest-Shamir-Adleman (RSA) private key for SSH authentication.
ecdsa	Optional. Specifies to use the unit's Rivest-Shamir-Adleman (RSA) private key for SSH authentication.
password <*password*>	Optional. Specifies a password is used for SSH authentication.
port <*port*>	Optional. Specifies a port to use for the file transfer. Valid range is **1** to **65535**.

privkey *<filename>*	Optional. Specifies a private key is used for SSH authentication. The file name is the name of the private key file in privacy enhanced email (PEM) format.
scp *<url>*	Specifies the Secure Copy Protocol (SCP) server Uniform Resource Locator (URL) to which to transfer the source file. Specify the URL in the following format: **user@server:/path/filename.**
sftp *<url>*	Specifies the Secure File Transfer Protocol server Uniform Resource Locator (URL) to which to transfer the source file. Specify the URL in the following format: **user@server:/path/filename.**
vrf *<name>*	Specifies a non-default virtual routing and forwarding (VRF) instance from which to copy the file.
flash	Specifies the file is copied securely from the flash drive.
scp *<url>*	Specifies the Secure Copy Protocol (SCP) server Uniform Resource Locator (URL) from which to transfer the source file. Specify the URL in the following format: **user@server:/path/filename.**
sftp *<url>*	Specifies the Secure File Transfer Protocol server Uniform Resource Locator (URL) from which to transfer the source file. Specify the URL in the following format: **user@server:/path/filename.**

Default Values

No default values are necessary for this command.

Command History

Release R10.10	Command was introduced.
Release R13.11.	Command was expanded to include **sftp**, **myprivkey**, **myprivkey dsa** and **myprivkey rsa**.
Release 14.4.0	Command was expanded to include **myprivkey ecdsa** for **sftp** and **scp** options.

Usage Examples

The following example uses SCP to copy **FILE1** from the VRF instance **V1** on the SSH server **john@server1** and performs SSH authentication using a password:

>**enable**
#copy vrf V1 scp john@server1:/FILE1 flash FILE1 password PSWD <filename>
#copy scp V1scp john@server1:/FILE1 flash FILE1 password PSWD <filename>

copy startup-config

Use the **copy startup-config** command to create a copy of the current startup configuration file and replace the current running configuration or save it to a specified memory location.

Variations of this command (valid on all AOS units) include:

copy startup-config *<filename>*
copy startup-config http *<url>*
copy startup-config http *<url>* **username** *<username>* **password** *<password>*
copy startup-config http *<url>* **port** *<port>*
copy startup-config http *<url>* **port** *<port>* **username** *<username>* **password** *<password>*
copy startup-config https *<url>*
copy startup-config https *<url>* **allow-tls1.0**
copy startup-config https *<url>* **allow-tls1.0 allow-tls1.1**
copy startup-config https *<url>* **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy startup-config https *<url>* **allow-tls1.0 allow-sslv3**
copy startup-config https *<url>* **allow-tls1.1**
copy startup-config https *<url>* **allow-tls1.1 allow-sslv3**
copy startup-config https *<url>* **allow-sslv3**
copy startup-config https *<url>* **username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.0 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.0 allow-tls1.1 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.0 allow-tls1.1 allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.0 allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.1 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-tls1.1 allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0**
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-tls1.1**
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-tls1.1 allow-sslv3**
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-sslv3**
copy startup-config https *<url>* **port** *<port>* **allow-sslv3**
copy startup-config https *<url>* **port** *<port>* **username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-tls1.1 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-tls1.1 allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.0 allow-sslv3 username** *<username>* **password** *<password>*

copy startup-config https *<url>* **port** *<port>* **allow-tls1.1 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-tls1.1 allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config https *<url>* **port** *<port>* **allow-sslv3 username** *<username>* **password** *<password>*
copy startup-config running-config
copy startup-config tftp
copy startup-config xmodem

Variations of this command (valid only on AOS units with CompactFlash® capability) include:

copy startup-config cflash *<filename>*
copy startup-config flash *<filename>*

Variations of this command (valid only on AOS units with **ramdisk** enabled) include:

copy startup-config ramdisk *<filename>*

Variations of this command (valid only on AOS units with Universal Serial Bus (USB) flash drive capability) include:

copy startup-config usbdrive0 *<filename>*

Syntax Description

<filename>	Specifies the file name to use when saving the startup configuration file.
cflash	Copies the startup configuration file and saves it to the CompactFlash card using the specified file name.
flash	Copies the startup configuration file and saves it to flash memory using the specified file name.
http *<url>*	Copies the startup configuration file and transfers it to a Hypertext Transfer Protocol (HTTP) server using the specified HTTP server uniform resource locator (URL). This function use the HTTP PUT operation.
https *<url>*	Copies the startup configuration file and transfers it to a secure socket Hypertext Transfer Protocol Secure (HTTPS) server using the specified HTTPS server URL. This function use the HTTPS PUT operation.
allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0 when transferring the startup configuration file. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 when transferring the startup configuration file. If **allow-tls1.1** is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3 when transferring the startup configuration file. If SSLv3 is enabled, then TLS version 1.0 is automatically enabled.
password *<password>*	Optional. Specifies a password for HTTP or HTTPS authentication.

port <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
ramdisk <*filename*>	Copies the current startup configuration file to the volatile RAM disk using the specified file name.
running-config	Merges the current running configuration with the startup configuration file.
tftp	Copies the current startup configuration file to a specified Trivial File Transfer Protocol (TFTP) server. After **copy startup-config tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server. *Destination filename:* Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
usbdrive0	Copies the startup configuration and saves it to the USB flash drive memory using the specified file name.
username <*username*>	Optional. Specifies a user name to use with HTTP or HTTPS authentication.
xmodem	Copies the current startup configuration (using the XMODEM protocol) to the terminal connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include **HTTP** and **HTTPS**.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.
Release R10.5.0	Command was expanded to include the **port**, **username**, and **password** parameters.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example copies the startup configuration file to the current running configuration:

>**enable**
#copy startup-config running-config
Opening and applying file...

*Any changes made to the current running configuration of the AOS unit that have not been saved to the startup configuration file (using the **write** command) will be lost when the **copy startup-config running-config** command is entered.*

The following example copies the startup configuration file (located in flash memory) to CompactFlash and names the file **config_01.txt**:

>**enable**
#copy startup-config cflash config_01.txt
Percent Complete 100%
#

The following example copies the current startup configuration file to a TFTP server and names the file **startup_01.txt**:

>**enable**
#copy startup-config tftp
Address of remote host? **10.200.2.4**
Destination filename? **startup_01.txt**
Initiating TFTP transfer...
Sent 3099 bytes.
Transfer Complete!
The following example copies the current startup configuration to the connected terminal using XMODEM protocol:

>**enable**
#copy startup-config xmodem
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to transmit the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Receive File** and select the destination. Once the transfer is complete, information similar to the following is displayed:

Sent 3704 bytes.
Transfer complete!

copy tftp

Use the **copy tftp** command to copy a file located on a network Trivial File Transfer Protocol (TFTP) server to a specified destination.

Variations of this command (valid on all AOS units) include:

copy tftp flash
copy tftp running-config
copy tftp startup-config

Variations of this command (valid only on AOS units with CompactFlash® capability) include:

copy tftp cflash

Variations of this command (valid only on AOS units with CompactFlash AND voice capability) include:

copy tftp dynvoice-config

Variations of this command (valid only on AOS units with **ramdisk** enabled) include:

copy tftp ramdisk

Variations of this command (valid only on AOS units with Universal Serial Bus (USB) flash drive capability) include:

copy tftp usbdrive0

Syntax Description

cflash	Copies a file from the TFTP server to the CompactFlash card.	
dynvoice-config	Specifies that the file copied from the TFTP server overwrite the dynamic voice configuration file.	
flash	Copies a file from the TFTP server to the flash memory.	
ramdisk	Copies a file from the TFTP server to the volatile RAM disk.	
running-config	Replaces the active running configuration with the file copied from the TFTP server.	
startup-config	Replaces the startup configuration with the file copied from the TFTP server.	
	After entering **copy tftp** and specifying the destination, AOS prompts for the following information:	
	Address of remote host:	Specifies the IP address of the TFTP server.
	Source filename:	Specifies the name of the file to copy from the TFTP server.
	Destination filename:	Specifies the file name to use when storing the copied file. (Valid only for the **copy tftp cflash**, **copy tftp flash**, **copy tftp ramdisk** commands.)
usbdrive0	Copies a file from the TFTP server to the USB flash drive memory.	

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.

Usage Examples

The following example replaces the current running configuration file with **newconfig.txt** from the TFTP server (**10.200.2.4**):

#copy tftp running-config
Address of remote host? **10.200.2.4**
Source filename? **newconfig.txt**
Initiating TFTP transfer...
Received 4562 bytes.
Transfer Complete!
#

The following example copies the file **myfile.biz** from the TFTP server (**10.200.2.4**) and saves it CompactFlash memory (naming the copy **newfile.biz**):

#copy tftp cflash
Address of remote host? **10.200.2.4**
Source filename? **myfile.biz**
Destination filename? **newfile.biz**
Initiating TFTP transfer...
Received 45647 bytes.
Transfer Complete!
#

copy tftp dot11ap

Use the **copy tftp dot11ap** command to upgrade the firmware on a specific access point (AP) using Trivial File Transfer Protocol (TFTP). Variations of this command include:

copy tftp dot11ap interface <*ap number*>
copy tftp dot11ap mac-address <*mac address*>

Syntax Description

interface <*ap number*>	Specifies the AP interface number to which to apply the firmware upgrade.
mac-address <*mac address*>	Specifies the medium access control (MAC) address of the AP's physical Ethernet interface to which to apply the firmware upgrade. Enter MAC addresses in the format **HH:HH:HH:HH:HH:HH**.

Default Values

No default values are necessary for this command.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following example specifies that a firmware upgrade is applied using TFTP to the AP interface **2**:

>**enable**
#copy tftp dot11ap interface 2

copy usbdrive0

Use the **copy usbdrive0** command to copy files located in Universal Serial Bus (USB) flash drive memory to a specified destination.

Variations of this command include:

copy usbdrive0 <*source file*> **boot**
copy usbdrive0 <*source file*> **flash**
copy usbdrive0 <*source file*> **flash** <*new file*>
copy usbdrive0 <*source file*> **http** <*url*>
copy usbdrive0 <*source file*> **http** <*url*> **port** <*port*>
copy usbdrive0 <*source file*> **http** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy usbdrive0 <*source file*> **http** <*url*> **username** <*username*> **password** <*password*>
copy usbdrive0 <*source file*> **https** <*url*>
copy usbdrive0 <*source file*> **https** <*url*> **port** <*port*>
copy usbdrive0 <*source file*> **https** <*url*> **port** <*port*> **username** <*username*> **password** <*password*>
copy usbdrive0 <*source file*> **https** <*url*> **username** <*username*> **password** <*password*>
copy usbdrive0 <*source file*> **startup-config**
copy usbdrive0 tftp
copy usbdrive0 <*source file*> **usbdrive0** <*new file*>
copy usbdrive0 xmodem

Syntax Description

<*new file*>	Saves the file using the specified file name.
<*source file*>	Specifies the name of the file to copy.
boot	Copies the specified source file and overwrites the boot read only memory (ROM).
flash	Copies the specified file and saves it to flash memory.
http <*url*>	Copies the specified source file and transfers it to a Hypertext Transfer Protocol (HTTP) server using the specified HTTP server uniform resource locator (URL). This function uses the HTTP PUT operation.
https <*url*>	Copies the specified source file and transfers it to a secure socket Hypertext Transfer Protocol Secure (HTTPS) server using the specified HTTPS server URL. This function uses the HTTPS PUT operation.
iport <*port*>	Optional. Specifies the port used to transfer the specified file to an HTTP or HTTPS server. Range is **0** to **65335**.
password <*password*>	Optional. Specifies a password to use with HTTP or HTTPS authentication.
startup-config	Replaces the startup configuration file with a copy of the specified file.
tftp	Copies any file located in USB flash drive memory to a specified Trivial File Transfer Protocol (TFTP) server. After **copy usbdrive0 tftp** is entered, the following prompts require additional information: *Address of remote host:* Specifies the IP address of the TFTP server.

	Source filename:	Specifies the name of the file (located in USB flash drive memory) to copy to the TFTP server.
	Destination filename:	Specifies the file name to use when storing the copied file on the TFTP server. The file will be placed in the default directory established by the TFTP server.
usbdrive0 <*new file*>	Copies the specified file and saves it to USB flash drive memory.	
username <*username*>	Optional. Specifies a user name to use with HTTP or HTTPS authentication.	
xmodem	Copies any file located in USB flash drive memory (using the XMODEM protocol) to the PC connected to the console port. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal.	
	After **copy flash xmodem** is entered, the following prompts the require additional information:	
	Source filename:	Specifies the name of the file to copy from USB flash drive memory using XMODEM.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.
Release R10.5.0	Command was expanded to include the **username** and **password** parameters.

Usage Examples

The following example creates a copy of the file **myfile.biz** (located in USB flash drive memory), names the new file **newfile.biz**, and places the new file in flash memory:

>**enable**
#copy usbdrive0 myfile.biz flash newfile.biz

The following example copies the file **myfile.biz** (located in USB flash drive memory) to CompactFlash memory and names the new file **newfile.biz**:

>**enable**
#copy usbdrive0 myfile.biz cflash newfile.biz

The following example copies the file **new_startup_config.txt** (located in USB flash drive memory) to the startup configuration file:

>**enable**
#copy usbdrive0 new_startup_config.txt startup-config

copy xmodem

Use the **copy xmodem** command to copy a file (using the XMODEM protocol) to a specified destination. XMODEM capability is provided in VT100 terminal emulation software, such as HyperTerminal.

Variations of this command (valid only on AOS units with CompactFlash® capability) include:

copy xmodem cflash

Variations of this command (valid only on AOS units with CompactFlash AND voice capability) include:

copy xmodem dynvoice-config

Variations of this command (valid only on AOS units with **ramdisk** enabled) include:

copy xmodem ramdisk

Variations of this command (valid only on AOS units with Universal Serial Bus (USB) flash drive capability) include:

copy xmodem usbdrive0

Variations of this command (valid on all AOS units) include:

copy xmodem flash
copy xmodem running-config
copy xmodem startup-config

Syntax Description

cflash	Copies a file from the terminal connected to the console port and saves it to the CompactFlash card. After entering **copy xmodem cflash**, AOS prompts for the following information: *Destination filename:* Specifies the file name to use when storing the copied file to cflash memory.
dynvoice-config	Specifies that the file copied from the terminal connected to the console port overwrite the dynamic voice configuration file.
flash	Copies a file from the terminal connected to the console port and saves it to flash memory. After entering **copy xmodem flash**, AOS prompts for the following information: *Destination filename:* Specifies the file name to use when storing the copied file to flash memory.
ramdisk	Copies a file from the terminal connected to the console port and saves it to the volatile RAM disk.
running-config	Replaces the active running configuration with a file copied from the terminal connected to the console port.

startup-config	Replaces the startup configuration with a file copied from the terminal connected to the console port.
usbdrive0	Copies a file from the terminal connected to the console port and saves it to the USB flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.

Usage Examples

The following example copies a software file (**myfile.biz**) to flash memory and renames it **newfile.biz**:

#copy xmodem flash
Destination filename? **newfile.biz**
Begin the Xmodem transfer now...
Press CTRL+X twice to cancel
CCCCCC

AOS is now ready to accept the file on the **CONSOLE** port (using the XMODEM protocol). The next step in the process may differ depending on the type of terminal emulation software you are using. For HyperTerminal, you will now select **Transfer > Send File** and browse to the file you wish to copy **myfile.biz**. Once the transfer is complete, information similar to the following is displayed:

Received 531424 bytes.
Transfer complete

debug aaa

Use the **debug aaa** command to activate debug messages associated with authentication from the authentication, authorization, and accounting (AAA) subsystem. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 5.1	Command was introduced.

Functional Notes

The **debug aaa** events include connection notices, login attempts, and session tracking.

Usage Examples

The following is sample output for this command:

```
>enable
#debug aaa
AAA: New Session on portal 'TELNET 0 (172.22.12.60:4867)'.
AAA: No list mapped to 'TELNET 0'. Using 'default'.
AAA: Attempting authentication (username/password).
AAA: RADIUS authentication failed.
AAA: Authentication failed.
AAA: Closing Session on portal 'TELNET 0 (172.22.12.60:4867)'.
```

debug activchassis

Use the **debug activchassis** command to enable debug messaging for ActivChassis. Variations of this command include:

debug activchassis
debug activchassis election
debug activchassis fan
debug activchassis filesync
debug activchassis linecard
debug activchassis poe
debug activchassis rpc
debug activchassis sfp

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

election	Optional. Specifies that debug messages for ActivChassis election events are enabled.
fan	Optional. Specifies that debug messages for ActivChassis fan events are enabled.
filesync	Optional. Specifies that debug messages for ActivChassis file synchronization events are enabled.
linecard	Optional. Specifies that debug messages for ActivChassis linecard events are enabled.
poe	Optional. Specifies that debug messages for ActivChassis Power over Ethernet (PoE) events are enabled.
rpc	Optional. Specifies that debug messages for ActivChassis remote procedure call (RPC) events are enabled.
sfp	Optional. Specifies that debug messages for ActivChassis small form-factor pluggable (SFP) interface events are enabled.

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.
Release R10.7.0	Command was expanded to include the **sfp** parameter.

Usage Examples

The following example enables debug messages for the entire ActivChassis:

>**enable**
#debug activchassis

debug arp

Use the **debug arp** command to activate debug messages associated with IP Address Resolution Protocol (ARP) transactions. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.3	Command was introduced.

Usage Examples

The following example activates debug messages associated with ARP transactions:

```
>enable
#debug arp
```

debug atm events

Use the **debug atm events** command to display events on all asynchronous transfer mode (ATM) ports and all virtual circuits. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates ATM event messages:

```
>enable
#debug atm events
```

debug atm oam

Use the **debug atm oam** command to display operations, administration, and maintenance (OAM) packets for an asynchronous transfer mode (ATM) virtual circuit descriptor (VCD). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug atm oam
debug atm oam <*vcd*>
debug atm oam <*vcd*> **loopback end-to-end**
debug atm oam <*vcd*> **loopback end-to-end** <*LLID*>
debug atm oam <*vcd*> **loopback segment**
debug atm oam <*vcd*> **loopback segment** <*LLID*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*vcd*>	Optional. Shows OAM packets for a specific VCD.
loopback	Optional. Configures an OAM loopback.
end-to-end	Optional. Configures an end-to-end OAM loopback.
segment	Optional. Configures a segment loopback.
<*LLID*>	Optional. Specifies 16 byte OAM loopback location ID (LLID).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates ATM OAM debug messages for VCD 1:

>**enable**
#debug atm oam 1

debug atm packet

Use the **debug atm packet** command to activate debug messages associated with packets on asynchronous transfer mode (ATM) ports and virtual circuits. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug atm packet
debug atm packet interface atm <*port id*>
debug atm packet interface atm <*port id*> **vcd** <*number*>
debug atm packet vc <*VPI/VCI*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

interface atm <*port id*>	Optional. Activates packet debug messages for a specific ATM port and for all virtual circuits.
vc <*VPI/VCI*>	Optional. Activates packet debug messages for the specified virtual circuit identified by the virtual path identifier and virtual channel identifier (VPI/VCI).
vcd <*number*>	Optional. Activates packet debug messages for the specified virtual circuit descriptors (VCDs).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates debug ATM packet debug messages on ATM port 1:

>enable
#debug atm packet interface atm 1

debug auto-config

Use the **debug auto-config** command to activate debug messages associated automatic configuration events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with automatic configuration events:

```
>enable
#debug auto-config
```

debug auto-link

Use the **debug auto-link** command to display event messages for the auto-link feature configuration. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.3/A2	Command was introduced.

Usage Examples

The following example activates auto-link debug messages:

```
>enable
#debug auto-link
```

debug bgp

Use the **debug bgp** command to activate debug messages associated with Internet Protocol version 4 (IPv4) Border Gateway Protocol (BGP). Debug messages display general BGP events, such as sent and received message summaries, route processing actions, and results. These messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug bgp
debug bgp events
debug bgp in
debug bgp out
debug bgp keepalives
debug bgp scan
debug bgp scan database
debug bgp scan route-table
debug bgp scan soft-reset
debug bgp updates
debug bgp updates quiet

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Optional. Displays significant BGP events, such as a neighbor state change.
in/out	Optional. Displays the same information as **debug bgp**, but limits messages to the specified direction (in or out).
keepalives	Optional. Displays BGP keepalive packets.
scan	Optional. Displays BGP background scan details.
database	Optional. Limits output to BGP database scan details.
route-table	Optional. Limits output to BGP route table scan details.
soft-reset	Optional. Limits output to BGP soft reset scan details.
updates	Optional. Displays detailed information on BGP updates for all neighbors.
updates quiet	Optional. Displays summary information about BGP neighbor updates. (Note: **updates quiet** displays a one-line summary of what **update** displays in 104 lines.)

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. In addition, the **scan**, **database**, **route-table**, and **soft-reset** parameters were added.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products.

Functional Notes

If no arguments are given, the **debug bgp** command displays general BGP events, such as sent/received message summaries, route processing actions, and results. Keepalive packets are not debugged with this command.

Usage Examples

The following example enables debug messages on general outbound BGP messages and events:

>**enable**
#debug bgp out
07:42:39: BGP OUT 10.15.240.1[2]: Transmitting msg, type=UPDATE (2), len=142

debug bridge

Use the **debug bridge** command to display messages associated with bridge events. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates bridge debug messages:

```
>enable
#debug bridge
```

debug chat-interfaces *<chat interface>*

Use the **debug chat-interfaces** command to activate debug messages associated with chat AT command-driven interfaces. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

<chat interface>	Activates debug messages for the specified chat interface identified by the slot/port.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages for the chat interface 0/1:

```
>enable
#debug chat-interfaces 0/1
```

debug color

Use the **debug color** command to activate color coding of debug messages. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the color coding of debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.

Functional Notes

Color coding is based on the debug source and color choices are not configurable.

Usage Examples

The following example enables color coding of debug messages:

```
>enable
#debug color
```

debug crypto

Use the **debug crypto** command to activate debug messages associated with cryptographic operations. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug crypto ecies
debug crypto ike
debug crypto ike client authentication
debug crypto ike client configuration
debug crypto ike negotiation
debug crypto pki

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

ecies	Activates debug messages during Elliptic Curve Integrated Encryption Scheme (ECIES) operations. This information could be useful for troubleshooting ECIES encryption/decryption issues.
ike	Activates all IKE debug messages.
ike client authentication	Optional. Displays IKE client authentication messages as they occur.
ike client configuration	Optional. Displays mode-config exchanges as they take place over the IKE security association (SA). It is enabled independently from the **debug ike negotiation** messaging.
ike negotiation	Optional. Activates only IKE key management debug messages (e.g., handshaking).
pki	Activates all public key infrastructure (PKI) debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 4.1	Command was introduced.
Release 6.1	Command was expanded to include the **pki** parameter.
Release R10.5.0	Command syntax was changed to remove **debug crypto ipsec**. IPsec now uses the *debug data-call* command for debug messages.
Release R11.10.0	Command was expanded to include the **ecies** parameter.

Usage Examples

The following example activates the IKE debug messages:

>**enable**
#debug crypto ike

debug data-call

Use the **debug data-call** command to activate debug messages associated with data call errors and events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with data call errors and events:

```
>enable
#debug data-call
```

debug demand-routing

Use the **debug demand-routing** command to activate debug messages associated with demand routing errors and events. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates demand routing error and event messages:

```
>enable
#debug demand-routing
```

debug desktop-auditing

Use the **debug desktop-auditing** command to enable debug messages for clients connected to the network. The desktop auditing debug messages include the network access protection (NAP) messages sent between clients and the server. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Debug messages can be activated for all clients connected to the network or only for specific clients. Using the **no** form of this command disables debug messaging for desktop auditing clients. Variations of this command include:

debug desktop-auditing
debug desktop-auditing hostname <*hostname*>
debug desktop-auditing interface gigabit-switchport <*slot/port*>
debug desktop-auditing interface switchport <*slot/port*>
debug desktop-auditing interface xgigabit-switchport <*slot/port*>
debug desktop-auditing ip <*ip address*>
debug desktop-auditing mac <*mac address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

hostname <*hostname*>	Optional. Activates debug messages only for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Activates debug messages only for the client using the specified gigabit switchport interface.
interface switchport <*slot/port*>	Optional. Activates debug messages only for the client using the specified switchport interface.
interface xgigabit-switchport <*slot/port*>	Optional. Activates debug messages only for the client using the specified 10 gigabit switchport interface.
ip <*ip address*>	Optional. Activates debug messages only for the client with the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
mac <*mac address*>	Optional. Activates debug messages only for the client with the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.
Release R10.7.0	Command was expanded to include the switchport and 10 gigabit switchport interfaces.

Usage Examples

The following is sample output of the **debug desktop-auditing** command:

```
2009.08.31 14:30:30 DESKTOP_AUDITING.DHCP.giga-swx 0/5 from 00:E0:29:0E:D5:E3 NAP Capable
    client
2009.08.31 14:30:31 DESKTOP_AUDITING.DHCP.giga-swx 0/24 from 00:E0:29:0E:D5:E5 to
    00:E0:29:0E:D5:E3 NAP Capable Server
2009.08.31 14:30:31 DESKTOP_AUDITING.DHCP.giga-swx 0/5 from 00:E0:29:0E:D5:E3 to
    00:E0:29:0E:D5:E5 NAP SoH: Firewall is 3rd-Party, AutoUpdates not downloading or installing
2009.08.31 14:30:31 DESKTOP_AUDITING.DHCP.giga-swx 0/24 from 00:E0:29:0E:D5:E5 to
    00:E0:29:0E:D5:E3 NAP SoHR: OK
```

debug dial-backup

Use the **debug dial-backup** command to activate debug messages associated with dial-backup operation. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 1.1	Command was introduced.
Release 2.1	Additional debug messages were implemented for dial-backup operation to Adtran's IQ and Express Series products.

Functional Notes

The **debug dial-backup** command activates debug messages to aid in the troubleshooting of dial-backup links.

Usage Examples

The following example activates debug messages for dial-backup operation:

```
>enable
#debug dial-backup
```

debug dialup-interfaces

Use the **debug dialup-interfaces** command to generate debug messages used to aid in troubleshooting problems with all dialup interfaces, such as the modem or the basic rate interface (BRI) cards. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 2.1	Command was introduced.

Functional Notes

When enabled, these messages provide status information on incoming calls, dialing and answering progress, etc. These messages also give information on why certain calls are dropped or rejected. It is beneficial to use this command when troubleshooting dial backup (in addition to the **debug dial-backup** command).

Usage Examples

The following example activates the debug messages for dialup interfaces:

>enable
#debug dialup-interfaces

debug dns

Use the **debug dns** command to activate debug messages associated with domain naming system (DNS) client operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dns
debug dns client
debug dns list
debug dns proxy
debug dns query-plan
debug dns resolver-queue
debug dns table

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

client	Optional. Activates debug messages associated with DNS client operation.
list	Optional. Activates debug messages associated with DNS address lists.
proxy	Optional. Activates debug messages associated with DNS proxy operation.
query-plan	Optional. Activates debug messages associated with DNS query plan operation.
resolver-queue	Optional. Activates debug messages associated with DNS resolver queue operation.
table	Optional. Activates debug messages associated with DNS table operation.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products.
Release R11.6.0	Command was expanded to include the **list**, **query-plan**, and **resolver-queue** parameters.

Functional Notes

The IPv4 and IPv6 DNS capability allows for DNS-based host translation (name-to-address).

Usage Examples

The following example activates debug messages associated with DNS client activity:

>**enable**
#debug dns client

debug dot11 all

Use the **debug dot11 all** command to enable all dot11 debugging for the wireless access controller (AC). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example activates all dot11 debug messages on the AC:

```
>enable
#debug dot11 all
```

debug dot11 client

Use the **debug dot11 client** command to enable all dot11 client debugging for the wireless access controller (AC). Debugging can also be limited to clients on a specific access point (AP) interface. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dot11 client
debug dot11 client interface dot11ap <*ap interface*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

interface dot11ap <*ap interface*>	Optional. Activates debug messages for the specified AP interface. Range is **1** to **8**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example activates debug messages for clients on AP interface 1:

>**enable**
#debug dot11 client interface dot11ap 1
2006.12.23 19:47:04 Dot11 Client: AP(1) Radio(1) VAP(1)Rx associate command from AP for 00:40:96:AB:3B:5E.
2006.12.23 19:48:40 Dot11 Client: AP(1) Radio(1) VAP(1)Rx disassociate command from AP for 00:40:96:AB:3B:5E.

These debug messages were captured as a wireless client associated and then disassociated with the AP.

debug dot11 config-apply

Use the **debug dot11 config-apply** command to enable debug messages for configuration changes applied to the NetVanta 160 Series access point (AP). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following example enables configuration change application debug messages for the NetVanta 160 Series AP:

```
>enable
#debug dot11 config-apply
```

debug dot11 firmware-upgrade

Use the **debug dot11 firmware-upgrade** command to enable debug messages for firmware upgrades applied to the NetVanta 160 Series access point (AP). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dot11 firmware-upgrade
debug dot11 firmware-upgrade verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

verbose	Optional. Activates detailed debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following example enables firmware upgrade debug messages for the NetVanta 160 Series AP:

```
>enable
#debug dot11 firmware-upgrade
```

debug dot11 packet-events

Use the **debug dot11 packet-events** command to enable debugging for all 802.11 control protocol packet events. Debugging can also be limited to a specified interface. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dot11 packet-events
debug dot11 packet-events interface <*interface*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

interface <*interface*>	Optional. Activates debug messages for the specified interface. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug dot11 packet-events interface ?** for a complete list of valid interfaces.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example activates packet-events debug messages on access point (AP) interface 1:

>enable
#debug dot11 packet-events interface dot11ap 1
#2006.12.23 18:54:25 Dot11 Packet Events: Rx Echo Req from MAC(00:A0:C8:1D:F8:57) AP(1)
2006.12.23 18:54:25 Dot11 Packet Events: Tx Echo Resp to MAC(00:A0:C8:1D:F8:57) AP(1)
2006.12.23 18:54:29 Dot11 Packet Events: Tx Query Req to MAC(00:A0:C8:1D:F8:57) AP(1)
2006.12.23 18:54:29 Dot11 Packet Events: Rx Query Resp from MAC(00:A0:C8:1D:F8:57) AP(1)
2006.12.23 18:54:36 Dot11 Packet Events: Rx Disc Resp from MAC(00:A0:C8:1D:F8:57) AP(1)

debug dot11 session

Use the **debug dot11 session** command to debug all dot11 sessions for the wireless access controller (AC). Debugging may also be limited to a specified interface. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dot11 session
debug dot11 session interface <*interface*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

interface <*interface*>	Optional. Activates debug messages for the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug dot11 session interface ?** for a complete list of valid interfaces.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example activates all dot11 session debug messages:

>enable
#debug dot11 session
2006.12.23 19:56:22 DOT11.Session : AP 1: AP reboot.
2006.12.23 19:56:22 DOT11.Session : AP 1: Control session lost.
2006.12.23 19:56:22 DOT11.Session : AP 1: Control session established.

debug dynamic-dns

Use the **debug dynamic-dns** command to activate debug messages associated with dynamic domain naming system (DNS). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug dynamic-dns
debug dynamic-dns verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

verbose	Optional. Activates detailed debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates dynamic DNS debug messages:

>enable
#debug dynamic-dns verbose

debug efm bonding

Use the **debug efm bonding** command to enable debug messaging for bonding negotiation links on all Ethernet in the first mile (EFM) groups. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.4.0	Command was introduced.

Usage Examples

The following example enables debug messaging for bonding negotiations an all EFM groups:

```
>enable
#debug efm bonding
```

debug efm config

Use the **debug efm config** command to enable debug messaging for all Ethernet in the first mile (EFM) components configured on the unit. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release A4.05	Command was introduced.

Usage Examples

The following example enables debug messaging for all EFM components:

```
>enable
#debug efm config
```

debug efm oam

Use the **debug efm oam** command to enable debug messaging for all Ethernet in the first mile (EFM) operations, administration, and management (OAM) and pre-provisioning components configured on the unit. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release A4.05	Command was introduced.

Usage Examples

The following example enables debug messaging for all EFM OAM components:

```
>enable
#debug efm oam
```

debug esmc-packets

Use the **debug esmc-packets** command to display raw Ethernet synchronization message channel (ESMC) packet dumps.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

No default values necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example enables the display of raw ESMC packet dumps:

```
>enable
#debug esmc-packets
```

debug ethernet cfm

Use the **debug ethernet cfm** command to activate all debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Use this command with caution as it causes a large amount of debug information. Large amounts of debug information can adversely affect the performance of your unit. To avoid an excess of debug information generation, select a debug command that does not activate all CFM debug messages at once.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example activates system-wide Ethernet OAM CFM debug messages:

```
>enable
#debug ethernet cfm
2008.09.22 11:00:08 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:00:09 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=195)
2008.09.22 11:00:09 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:00:10 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=196)
2008.09.22 11:00:10 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:00:11 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=197)
2008.09.22 11:00:11 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:00:12 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=198)
2008.09.22 11:00:12 CFM.MD MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
```

debug ethernet cfm alarm

Use the **debug ethernet cfm alarm** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) fault alarms. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm alarm
debug ethernet cfm alarm domain <*domain name*>
debug ethernet cfm alarm domain <*domain name*> **association** <*association name*>
debug ethernet cfm alarm domain <*domain name*> **association** <*association name*> **mep** <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

domain <*domain name*>	Optional. Specifies that debug output is limited to alarm information for maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to alarm information for MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to alarm information for MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables all Ethernet OAM CFM alarm debug messages:

>**enable**
#debug ethernet cfm alarm
2008.09.22 11:06:20 CFM.FNG MD:BenchTest|MA:BenchAssoc|MEP:1|FNG|Set state: FNG_DEFECT
2008.09.22 11:06:22 CFM.FNG MD:BenchTest|MA:BenchAssoc|MEP:1|FNG|Set state:
FNG_REPORT_DEFECT
2008.09.22 11:06:22 CFM.FNG MD:BenchTest|MA:BenchAssoc|MEP:1|FNG|Set state:
FNG_DEFECT_REPORTED
2008.09.22 11:06:22 CFM.MD:BenchTest|MA:BenchAssoc|MEP:1| mep signaled new fault

debug ethernet cfm ccm rcv

Use the **debug ethernet cfm ccm rcv** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) continuity check message (CCM) receive paths. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm ccm rcv
debug ethernet cfm ccm rcv domain <*domain name*>
debug ethernet cfm ccm rcv domain <*domain name*> **association** <*association name*>
debug ethernet cfm ccm rcv domain <*domain name*> **association** <*association name*> **mep** <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

domain <*domain name*>	Optional. Specifies that debug output is limited to CCM receive path information for maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to CCM receive path information for MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to CCM receive path information for MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM debug messages for all CCM receive paths:

>**enable**
#debug ethernet cfm ccm rcv
2008.09.22 11:02:49 CFM.CCR MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:02:50 CFM.CCR MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:02:51 CFM.CCR MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:02:52 CFM.CCR MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2
2008.09.22 11:02:53 CFM.CCR MD:BenchTest|MA:BenchAssoc|MEP:1|CCR|Rx CCM from MEPID 2

debug ethernet cfm ccm xmit

Use the **debug ethernet cfm ccm xmit** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) continuity check message (CCM) transmit paths. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm ccm xmit
debug ethernet cfm ccm xmit domain <*domain name*>
debug ethernet cfm ccm xmit domain <*domain name*> **association** <*association name*>
debug ethernet cfm ccm xmit domain <*domain name*> **association** <*association name*> **mep** <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

domain <*domain name*>	Optional. Specifies that debug output is limited to CCM transmit path information for maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to CCM transmit path information for MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to CCM transmit path information for MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM debug messages for all CCM transmit paths:

>**enable**
#debug ethernet cfm ccm xmit
2008.09.22 11:01:43 CFM.CCM MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=290)
2008.09.22 11:01:44 CFM.CCM MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=291)
2008.09.22 11:01:45 CFM.CCM MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=292)
2008.09.22 11:01:46 CFM.CCM MD:BenchTest|MA:BenchAssoc|MEP:1|CCM|Sent CCM (ID=293)

debug ethernet cfm linktrace

Use the **debug ethernet cfm linktrace** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) linktrace message paths. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm linktrace request
debug ethernet cfm linktrace request domain <*domain name*>
debug ethernet cfm linktrace request domain <*domain name*> **association** <*association name*>
debug ethernet cfm linktrace request domain <*domain name*> **association** <*association name*> **mep** <*mep id*>
debug ethernet cfm linktrace response
debug ethernet cfm linktrace response domain <*domain name*>
debug ethernet cfm linktrace response domain <*domain name*> **association** <*association name*>
debug ethernet cfm linktrace response domain <*domain name*> **association** <*association name*> **mep** <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

request	Specifies debug messages are enabled for linktrace message request paths.
response	Specifies debug messages are enabled for linktrace message response paths.
domain <*domain name*>	Optional. Specifies that debug output is limited to linktrace message path information for maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to linktrace message path information for MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to linktrace message path information for MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM debug messages for all linktrace message request paths:

```
>enable
#debug ethernet cfm linktrace request
```

debug ethernet cfm loopback

Use the **debug ethernet cfm loopback** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) loopback message paths. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm loopback request
debug ethernet cfm loopback request domain <*domain name*>
debug ethernet cfm loopback request domain <*domain name*> **association** <*association name*>
debug ethernet cfm loopback request domain <*domain name*> **association** <*association name*> **mep** <*mep id*>
debug ethernet cfm loopback response
debug ethernet cfm loopback response domain <*domain name*>
debug ethernet cfm loopback response domain <*domain name*> **association** <*association name*>
debug ethernet cfm loopback response domain <*domain name*> **association** <*association name*> **mep** <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

request	Specifies debug messages are enabled for loopback message request paths.
response	Specifies debug messages are enabled for loopback message response paths.
domain <*domain name*>	Optional. Specifies that debug output is limited to loopback message path information for maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to loopback message path information for MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to loopback message path information for MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM debug messages for all loopback message request paths:

```
>enable
#debug ethernet cfm loopback request
```

debug ethernet cfm remote-mep

Use the **debug ethernet cfm remote-mep** command to activate debug messages associated with Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) remote maintenance endpoints (MEPs). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet cfm remote-mep
debug ethernet cfm remote-mep domain <*domain name*>
debug ethernet cfm remote-mep domain <*domain name*> **association** <*association name*>
debug ethernet cfm remote-mep domain <*domain name*> **association** <*association name*>
mep <*mep id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

domain <*domain name*>	Optional. Specifies that debug output is limited to information for remote maintenance endpoints (MEPs) of a specific domain.
association <*association name*>	Optional. Specifies that debug output is limited to information for remote MEPs of a specific association.
mep <*mep id*>	Optional. Specifies that debug output is limited to information for remote MEPs that match a specific MEP ID. MEP ID range is **1** to **8191**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM debug messages for all remote MEPs:

>**enable**
#debug ethernet cfm remote-mep
2008.09.22 11:13:50 CFM.RMEP MD:BenchTest|MA:BenchAssoc|MEP:1|RMEP|Set CCMdefect: true
2008.09.22 11:13:53 CFM.MD:BenchTest|MA:BenchAssoc|MEP:1| mep signaled new fault alarm state (3)

debug ethernet lmi interface <*interface*>

Use the **debug ethernet lmi** command to enable debug messages of Ethernet local management interface (E-LMI) events or packets. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet lmi interface <*interface*> **event**
debug ethernet lmi interface <*interface*> **packet**

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

interface <*interface*>	Specifies an interface on which to enable E-LMI debug messages. Specify interfaces in the format <*interface type [slot/port]*>. For example, for a Gigabit Ethernet interface, use **gigabit eth 0/1**. Type **debug ethernet lmi interface ?** for a complete list of interfaces.
event	Specifies that debug messages for E-LMI events are generated.
packet	Specifies that debug messages for E-LMI packets are generated.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example enables debug messages for E-LMI events on the Gigabit Ethernet interface:

>enable
#debug ethernet lmi interface gigabit-ethernet 0/1 event

debug ethernet oam

Use the **debug ethernet oam** command to activate all debug messages associated with Ethernet Link operations, administration, and maintenance (OAM) configurations. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ethernet oam interface <*interface*>
debug ethernet oam interface <*interface*> **critical**
debug ethernet oam interface <*interface*> **discovery**
debug ethernet oam interface <*interface*> **link-monitor**
debug ethernet oam interface <*interface*> **packet**

Turning on a large amount of debug information can adversely affect the performance of your unit

Syntax Description

interface <*interface*>	Enables Ethernet Link OAM debug messaging on the interface, and specifies that debug output for all Ethernet Link OAM configurations, except OAM PDU transmissions, are included in the debug output. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for a Gigabit Ethernet interface, use **giga-eth 0/1**. For an Ethernet in the first mile (EFM) group, use **efm-group 1/1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.
critical	Optional. Specifies that debug output is limited to link event messages for the specified interface.
discovery	Optional. Specifies that debug output is limited to Ethernet Link OAM discovery processes on the specified interface.
link-monitor	Optional. Specifies that debug output is limited to link event message processing on the specified interface.
packet	Optional. Specifies that debug output is limited to information for transmitted and received OAM PDUs on the specified interface.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

The following example enables debug messaging for Ethernet Link OAM link monitoring events on the Gigabit Ethernet **0/1** interface:

>**enable**
#debug ethernet oam gigabit-ethernet 0/1 link-monitor
2013.08.28 18:10:11 LINK_OAM.giga-eth 0/1 link-monitor
Processing Link Event Notification PDU, sequence number: 3
    Type: Errored Frame
        Timestamp: 0
        Window: 10
        Threshold: 1
        Errored Frames: 16
        Error Running Total: 0
        Event Running Total: 3

2013.08.28 18:10:12 LINK_OAM.giga-eth 0/2 link-monitor
Processing Link Event Notification PDU, sequence number: 4
    Type: Errored Frame
        Timestamp: 0
        Window: 10
        Threshold: 1
        Errored Frames: 16
        Error Running Total: 0
        Event Running Total: 4

debug frame-relay lmi

Use the **debug frame-relay lmi** command to activate debug messages associated with the Frame Relay operation for the local management interface (LMI), such as data link connection identifier (DLCI) status signaling state, etc. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 1.1	Command was introduced.
Release 17.6	Command was altered to remove **events** and **llc2** options.

Functional Notes

The **debug frame-relay lmi** command activates debug messages to aid in the troubleshooting of Frame Relay links.

Usage Examples

The following example activates debug messages associated with Frame Relay LMI operation:

```
>enable
#debug frame-relay lmi
```

debug frame-relay multilink

Use the **debug frame-relay multilink** command to activate debug messages associated with Frame Relay multilink operation. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug frame-relay multilink
debug frame-relay multilink <*interface*>
debug frame-relay multilink states

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*interface*>	Optional. Activates debug messages for the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug frame-relay multilink ?** for a complete list of applicable interfaces.
states	Optional. Activates the debug messages for Link Integrity Protocol (LIP).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with multilink operation for all Frame Relay interfaces:

>**enable**
#debug frame-relay multilink

debug global-policer

Use the **debug global-policer** command to activate debug messages associated with the virtual AOS (vAOS) global policer. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

The **debug global-policer** events include expiration of warning event periods or installation of new vAOS licenses.

Usage Examples

The following is sample output for this command when a warning event period has expired:

```
>enable
#debug global-policer
2016.06.20 16:23:27 GLOBAL_POLICER Warning event period expired
    Time since most recent interface statistics clear: never
    Output bytes: 5338483 previous, 5347457 current
    Dropped packets: 0 previous, 0 current
    Dropped bytes: 0 previous, 0 current
2016.06.20 16:23:27 GLOBAL_POLICER Average rate last interval = 239 bps; threshold = 45000000 bps
```

The following is sample output for this command when a new vAOS license is installed:

```
>enable
#debug global-policer
2016.06.20 18:22:00 GLOBAL_POLICER Updated CIR = 50 Mbps; CBS = 5625000 bytes
```

debug gvrp bpdus

Use the **debug gvrp bpdus** command to display debug messages showing all GARP VLAN Registration Protocol (GVRP) configuration messages sent and received on the switch. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Functional Notes

With GVRP enabled on many ports, this command can produce a lot of output. To display these messages for individual interfaces, refer to the command *debug gvrp interface <interface> on page 340*.

Usage Examples

The following example displays debug messages showing GVRP configuration messages sent and received on Ethernet interface 0/24:

```
>enable
#debug gvrp bpdus
2000.07.31 23:15:51 GVRP BPDUS.eth 0/24: TX = (Len:2 LeaveAll) (Len:4 JoinIn Vlan:1) (End) ... SENT
2000.07.31 23:15:52 GVRP BPDUS.eth 0/24: RX = (Len:4 Empty Vlan:2) (Len:4 JoinIn Vlan:20) (end)
2000.07.31 23:15:52 GVRP BPDUS.eth 0/24: TX = (Len:4 JoinIn Vlan:1) (End) ... SENT
2000.07.31 23:15:52 GVRP BPDUS.eth 0/24: RX = (Len:4 JoinIn Vlan:20) (end)
2000.07.31 23:16:00 GVRP BPDUS.eth 0/24: RX = (Len:2 LeaveAll) (end)
#
```

debug gvrp interface *<interface>*

Use the **debug gvrp interface** command to display GARP VLAN Registration Protocol (GVRP) debug messages related to a particular interface. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug gvrp interface <*interface*> **bpdus**
debug gvrp interface <*interface*> **vlans**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<interface>	Activates debug messages for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug gvrp interface ?** for a complete list of applicable interfaces.
bpdus	Displays debug messages showing all GVRP configuration messages sent and received on the interface.
vlans	Displays debug messages showing all GVRP-related VLAN changes occurring on the interface.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example displays debug messages showing GVRP configuration messages sent and received on Ethernet interface 0/24:

>**enable**
#debug gvrp interface ethernet 0/24 bpdus
2000.07.31 23:15:51 GVRP BPDUS.eth 0/24: TX = (Len:2 LeaveAll) (Len:4 JoinIn Vlan:1) (End) ... SENT
2000.07.31 23:15:52 GVRP BPDUS.eth 0/24: RX = (Len:4 Empty Vlan:2) (Len:4 JoinIn Vlan:20) (end)
2000.07.31 23:15:52 GVRP BPDUS.eth 0/24: TX = (Len:4 JoinIn Vlan:1) (End) ... SENT
--MORE--

debug gvrp vlans

Use the **debug gvrp vlans** command to display debug messages showing all GARP VLAN Registration Protocol (GVRP) VLAN changes. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug gvrp vlans
debug gvrp vlans <*vlan id*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*vlan id*>	Optional. Activates debug messages for GVRP-related VLAN changes for the specified VLAN. Range is **1** to **4094**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Functional Notes

With GVRP enabled on many ports, this command can produce a lot of output. To display these messages for an individual interface, refer to the command *debug gvrp interface <interface> on page 340*.

Usage Examples

The following example displays debug messages showing GVRP-related VLAN changes for VLAN 1:

```
>enable
#debug gvrp vlans 1
#
2000.07.31 22:05:42 GVRP VLANS: Creating dynamic VLAN 20
2000.07.31 22:05:42 GVRP VLANS.eth 0/24: Dynamically adding port to VLAN 20
#
2000.07.31 22:05:56 INTERFACE_STATUS.eth 0/24 changed state to down
2000.07.31 22:06:08 GVRP VLANS.eth 0/24: Dynamically removing port from VLAN 20
2000.07.31 22:06:08 GVRP VLANS: Last port removed from VLAN 20, destroying VLAN
```

debug hmr

Use the **debug hmr** command to enable debug messaging for either Session Initiation Protocol (SIP) header manipulation rules (HMR) processes or rules. Use the **no** form of this command to disable debug messages. Variations of this command include:

debug hmr
debug hmr configuration
debug hmr traffic

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

configuration	Optional. Specifies that whenever HMR configuration changes, debug messages outlining HMR rule configuration events are generated.
traffic	Optional. Specifies that whenever HMR policies are applied to traffic, debug messages outlining HMR message processing events are generated.

Default Values

By default, debug messaging is disabled. When HMR debug messaging is enabled, if neither optional keyword is specified when the command is entered, then HMR debug messages are generated on any HMR rule changes that occur.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example enables debug messaging for HMR policies and their application to SIP traffic:

```
>enable
#debug sip stack messages
#debug hmr traffic
00:52:13.323 SIP.STACK MSG          Rx: UDP src=10.17.142.1:5060 dst=10.17.142.252:5060

debug http client

Use the **debug http client** command to activate debug messages associated with Hypertext Transfer Protocol (HTTP) client operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products.

Usage Examples

The following example activates debug messages associated with HTTP client activity:

```
>enable
#debug http client
```

debug http server

Use the **debug http server** command to activate debug messages associated with Hypertext Transfer Protocol (HTTP) server operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug http server
debug http server verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

verbose	Optional. Activates detailed debug messages for HTTP operation.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 6.1	Command was introduced.
Release 15.1	Command was updated.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products.

Usage Examples

The following example activates debug messages associated with HTTP server activity:

>enable
#debug http server

debug hw-access-list <*name*>

Use the **debug hw-access-list** command to activate debug messages that display traffic matches logged by the named hardware access control list (ACL). Use the **no** form of this command to disable the debug messages.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

<*name*>	Specifies the name of the hardware ACL.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.6	Command was introduced.

Functional Notes

The **debug hw-access-list** <*name*> command displays data gathered by a configured hardware ACL. The specified hardware ACL must have logging enabled to populate the debug message. For more information on hardware ACLs and event match logging, refer to the *Hardware ACL and Access Map Command Set on page 4235*.

> NOTE *Only hardware ACL debug messages can be displayed using this command. If you enter a software ACL name in this command, you will receive an error message.*

Usage Examples

Enter the command as follows to enable debug messages for the hardware ACL **ADTN**:

```
>enable
#debug hw-access-list ADTN
2009.05.07 11:32:39 ACCESS_LIST.ADTN   permit mac 00:a0:c8:00:00:00 00:00:00:ff:ff:ff any log
    (44864 matches)

2009.05.07 11:32:45 ACCESS_LIST.ADTN   permit mac 00:a0:c8:00:00:00 00:00:00:ff:ff:ff any log
    (106 matches)

2009.05.07 11:32:49 ACCESS_LIST.ADTN   permit mac 00:a0:c8:00:00:00 00:00:00:ff:ff:ff any log
    (90 matches)
```

debug interface <*interface*>

Use the **debug interface** command to activate debug messages associated with the specified interface. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<interface>	Activates debug messages for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug interface ?** for a complete list of applicable interfaces.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.
Release 6.1	Command was expanded to include the T1 and foreign exchange station (FXS) interfaces.
Release 7.1	Command was expanded to include the foreign exchange office (FXO) interface.
Release 9.1	Command was expanded to include the tunnel interface.
Release A4.05	Command was expanded to include the asymmetric digital subscriber line (ADSL) interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release 13.1.0	Command was expanded to include the virtual extensible local area network (VxLAN) tunnel interface.

Functional Notes

The **debug interface** command activates debug messages to aid in the troubleshooting of physical interfaces.

Usage Examples

The following example activates debug messages associated with tunnel interface 1, which is configured as a (virtual extensible local area network) VxLAN type tunnel:

>**enable**
#debug interface tunnel 1
2017.05.05 05:52:32 TUNNEL.1 VxLAN: Encapsulating original packet 10.0.2.15->10.0.2.17 (len=178 ttl=255).
2017.05.05 05:53:12 TUNNEL.1 Vxlan Rx: Decapsulating original packet 10.0.2.17->10.0.2.15 (len=58 ttl=253 Protocol=17).
2017.05.05 05:53:12 TUNNEL.1 Vxlan Rx: ARP Request/Reply theHardwareType:1, theProtocolType:800, theHardwareSize:4, theProtocolSize:0, theOpcode=1, senderMac:00:11:22:33:44:AB, senderIp:10.10.10.1, vni:200
2017.05.05 05:53:12 TUNNEL.1 Vxlan Rx: PostDecapsulate: VNI=200,
2017.05.05 05:53:12 TUNNEL.1 VxLAN: Encapsulating original packet 10.0.2.15->10.0.2.17 (len=178 ttl=255).
2017.05.05 05:55:59 TUNNEL.1 Vxlan Tx: Packet Size exceeds tunnel MTU. Dropping packet
2017.05.05 05:55:59 TUNNEL.1 VxLAN: Encapsulating original packet 10.0.2.15->10.0.2.17 (len=98 ttl=255).
2017.05.05 05:56:01 TUNNEL.1 Vxlan Tx: Packet Size exceeds tunnel MTU. Dropping packet
2017.05.05 06:01:18 TUNNEL.1 Vxlan Rx: ARP Request/Reply theHardwareType:1, theProtocolType:800, theHardwareSize:4, theProtocolSize:0, theOpcode=2, senderMac:00:11:22:33:44:AB, senderIp:192.168.100.100, vni:100

debug interface adsl events

Use the **debug interface adsl events** command to activate debug messages associated with asymmetric digital subscriber line (ADSL) events. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.1	Command was introduced.

Usage Examples

The following example activates debug messages for ADSL events:

```
>enable
#debug interface adsl events
```

debug interface cellular

Use the **debug interface cellular** command to activate debug messages associated with the cellular interface. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug interface cellular
debug interface cellular <*slot/port*>
debug interface cellular <*slot/port*> **data**
debug interface cellular <*slot/port*> **data-hdlc**
debug interface cellular <*slot/port*> **diag-hdlc**
debug interface cellular <*slot/port*> **diagnostic**
debug interface cellular <*slot/port*> **diagnostic rx**
debug interface cellular <*slot/port*> **diagnostic tx**
debug interface cellular <*slot/port*> **diagnostic both**
debug interface cellular <*slot/port*> **download**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*slot/port*>	Optional. Activates debug messages for the specified cellular interface.
data	Optional. Activates debug messages for the handshaking signals on the data channel.
data-hdlc	Optional. Activates debug messages for high level data link control (HDLC) errors on the data channel.
diag-hdlc	Optional. Activates debug messages for HDLC errors on the diagnostic channel.
diagnostic	Optional. Activates debug messages for all packets.
diagnostic rx	Optional. Activates debug messages for packets moving from the cellular interface to the network.
diagnostic tx	Optional. Activates debug messages for packets moving from the network to the cellular interface.
diagnostic both	Optional. Activates debug messages for both transmitted and received packets.
download	Optional. Activates debug messages for application downloads.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.2	Command was introduced.
Release 17.4	Command was expanded to include the keyword **both**.

Usage Examples

The following example activates error and event debug messages associated with the cellular interface:

>**enable**
#debug interface cellular

debug interface cellular modem messaging

Use the **debug interface cellular modem messaging** command to activate debug messages associated with messages going to or from the cellular modem. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug interface cellular modem messaging
debug interface cellular modem messaging detail
debug interface cellular modem messaging include-polled
debug interface cellular modem messaging include-polled detail

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

detail	Optional. Specifies that detailed information about messages going to or from the modem is included in the debug message.
include-polled	Optional. Specifies that polled messages going to and from the modem are included in the debug message.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.9.0	Command was introduced.

Usage Examples

The following example activates debug messages associated with messages going to or from the cellular modem:

>enable
#debug interface cellular modem messaging

debug ip access-list *<name>*

Use the **debug ip access-list** command to activate debug messages for a specific Internet Protocol version 4 (IPv4) access control list (ACL). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

<name>	Specifies a configured IPv4 ACL.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 6.1	Command was introduced.
Release R10.2.0	Command syntax was changed to require the **ip** keyword.

Functional Notes

The **debug ip access-list** command provides debug messages to aid in troubleshooting IPv4 ACL issues. These debug messages are populated by traffic matches that occur when traffic is filtered through the ACL. The ACL must have the logging feature enabled in order to populate the debug message. To enable ACL match logging, refer to the *IPv4 Access Control List Command Set on page 4252*.

Usage Examples

The following is sample output of debug messages for the IPv4 ACL labeled **MatchAll**:

```
>enable
#debug ip access-list MatchAll
2009.06.09 14:15:03 ACCESS_LIST.MatchAll      permit host 192.168.0.1 log (1 matches)
2009.06.09 14:15:13 ACCESS_LIST.MatchAll      permit host 192.168.0.1 log (3 matches)
2009.06.09 14:15:57 ACCESS_LIST.MatchAll      permit host 192.168.0.1 log (1 matches)
```

debug ip crypto ipsec

Use the **debug ip crypto ipsec** command to activate debug messages associated with Internet Protocol security (IPsec) functions. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.5.0	Command was introduced. This command replaces the **debug crypto ipsec** command.

Usage Examples

The following example activates the IPsec debug messages:

```
>enable
#debug ip crypto ipsec
```

debug ip dhcp client

Use the **debug ip dhcp client** command to activate debug messages associated with Dynamic Host Configuration Protocol version 4 (DHCPv4) client operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip dhcp client
debug ip dhcp client <*interface*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*interface*>	Optional. Specifies an interface to which an IPv4 address can be assigned in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug ip dhcp-client ?** for a list of valid interfaces.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 2.1	Command was introduced.
Release 16.1	Command was expanded to include the **interface** parameter.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release 18.3	Command syntax was changed to remove the hyphen (from **dhcp-client**) for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen (from **dhcp-client**) for Adtran voice products.

Functional Notes

The **debug ip dhcp client** command activates debug messages to provide information on DHCPv4 client activity in AOS. The AOS DHCPv4 client capability allows interfaces to dynamically obtain an IPv4 address from a network DHCPv4 server.

Usage Examples

The following example activates debug messages associated with DHCPv4 client activity:

>**enable**
#debug ip dhcp client

debug ip dhcp relay

Use the **debug ip dhcp relay** command to activate debug messages associated with Dynamic Host Configuration Protocol version 4 (DHCPv4) relay operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip dhcp relay
debug ip dhcp relay vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.2	Command was introduced.
Release 18.3	Command syntax was changed to remove the hyphen (from **dhcp-relay**) for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen (from **dhcp-relay**) for Adtran voice products.

Functional Notes

The **debug ip dhcp relay** command activates debug messages to provide information on DHCPv4 relay activity in AOS. The AOS DHCPv4 relay capability allows AOS to relay DHCPv4 messages to a configured destination on the network.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates debug messages associated with DHCPv4 server activity only on the default VRF instance:

>enable
#debug ip dhcp relay

debug ip dhcp server

Use the **debug ip dhcp server** command to activate debug messages associated with Dynamic Host Configuration Protocol version 4 (DHCPv4) server operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip dhcp server
debug ip dhcp server vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command syntax was changed to remove the hyphen (from **dhcp-server**) for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen (from **dhcp-server**) for Adtran voice products.

Functional Notes

The **debug ip dhcp server** command activates debug messages to provide information on DHCPv4 server activity in AOS. The AOS DHCPv4 server capability allows AOS to dynamically assign IPv4 addresses to hosts on the network.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates debug messages associated with DHCPv4 server activity only on the default VRF instance:

>**enable**
#debug ip dhcp server

debug ip ffe wildcards

Use the **debug ip ffe wildcards** command to enable debug messaging for Internet Protocol version 4 (IPv4) RapidRoute wildcard events. This command can be used to determine which of several subsystem configurations caused a specific RapidRoute wildcard to be disabled.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.You can view wildcard status on a per-interface basis using the command* *show ip ffe on page 708*.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.10.0	Command was introduced.

Functional Notes

When RapidRoute wildcard debug messages are enabled, two wildcard events are displayed. A **calculate** event, generated when an interface is called to recalculate its inbound or outbound wildcards, displays the results for each subsystem in the order in which wildcard processing is completed. A **finalize set** event is generated when the complete wildcards for an interface are pushed to either hardware or software processing and the new wildcards are used.

The order of wildcard bits displayed in a wildcard debug message are the opposite of the order displayed in the **show ip ffe wildcard** command, and exclude the Destination IP Address (which cannot be wildcarded). The last bit displayed at the end of the wildcard string is the least significant bit and represents the Source IP Address.

Usage Examples

The following example enables RapidRoute wildcard debug messaging and provides sample event output. Also included in the example are the configuration of the IPv4 access control list (ACL) named **ACL** and its application to the gigabit Ethernet subinterface **0/5.1**:

```
>enable
#debug ip ffe wildcards
#config t
(config)#ip access-list extended ACL
(config-ext-nacl)#permit icmp any any echo
(config-ext-nacl)#exit
(config)#interface gigabit ethernet 0/5.1
(config-giga-eth 0/5.1)#ip access-group ACL out
```

```
2015.01.01 12:00:34 FFEWILDCARDV4.giga-eth 0/5.1 calculate outbound:
    QoS:                    11111111111
    AccessGroup:            11011110111
2015.01.01 12:00:34 FFEWILDCARDV4.Loopback finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV4.null 0 finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV4.giga-eth 0/2.1 finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV4.giga-eth 0/5.1 finalize set: 11011110111
```

debug ip firewall

Use the **debug ip firewall** command to activate debug messages associated with the AOS Internet Protocol version 4 (IPv4) firewall operation. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip firewall
debug ip firewall vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** parameter.
Release 17.9	Command was changed to require the **ip** keyword for Adtran internetworking products only.
Release R10.1.0	Command was changed to require the **ip** keyword for Adtran voice products.

Functional Notes

The **debug ip firewall** command activates debug messages to provide real-time information about the IPv4 AOS stateful inspection firewall operation.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates the debug messages for the IPv4 AOS stateful inspection firewall:

>enable
#debug ip firewall

The following example activates the IPv4 firewall debug messages for the VRF instance **gray** and provides sample output:

>**enable**
#debug ip firewall vrf gray

2000.05.11 19:29:04 FIREWALL_VRF.Gray SrcPort: 41801, DstPort: 80
2000.05.11 19:29:04 FIREWALL_VRF.Gray Selector2: Dir=Public, int=vlan 309, Protocol=6, VRF Black cookie-> vlan 306
2000.05.11 19:29:04 FIREWALL_VRF.Gray SrcIp: 192.168.10.140, DstIp: 192.168.9.6
2000.05.11 19:29:04 FIREWALL_VRF.Gray SrcPort: 80, DstPort: 41801
2000.05.11 19:29:04 FIREWALL_VRF.Gray Deleting Association
2000.05.11 19:29:04 FIREWALL_VRF.Gray Assoc Index = 6242787, Count (total, policy-class) = 127, 126
2000.05.11 19:29:04 FIREWALL_VRF.Gray nat source -> 192.168.9.6, flags = 0x2000003F, 0x00000004, timeout = 6

debug ip firewall alg sip

Use the **debug ip firewall alg sip** command to activate debug messages associated with Session Initiation Protocol (SIP) information with AOS firewall operation. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip firewall alg sip
debug ip firewall alg sip packets
debug ip firewall alg sip verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

packets	Optional. Activates firewall application-level gateway (ALG) SIP packet debug messages.
verbose	Optional. Activates detailed debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.3	Command was introduced.
Release A1	Command was expanded to include the **packets** parameter.
Release 17.9	Command was changed to require the **ip** keyword for Adtran internetworking products only.
Release R10.1.0	Command was changed to require the **ip** keyword for Adtran voice products.

Usage Examples

The following example activates debug messages associated with SIP information with AOS firewall operation:

>**enable**
#debug ip firewall alg sip

debug ip flow

Use the **debug ip flow** command to display debug messages associated with integrated traffic monitoring (ITM) operation. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip flow cache entry
debug ip flow cache expiration
debug ip flow export

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

cache entry	Specifies a debug message will be generated every time traffic flow data is added to the flow cache.
cache expiration	Specifies a debug message will be generated every time traffic flow data expires from the flow cache.
export	Specifies a debug message will be generated every time a message is sent to an external data collector.

Default Values

By default, debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example enables debug messages for the **ip flow export** command and gives sample output:

```
#debug ip flow export
#show run
    ip flow export destination 10.22.22.254 3000
    ip flow export vrf BLUE destination 172.16.4.5 65774

*Dec 18 22:45:43: IPFLOW: Sent export pkt #32958 to 10.22.22.254:3000
*Dec 18 22:45:43: IPFLOW: Sent export pkt #32958 to 172.16.4.5:65774 (BLUE)
```

The following is sample output from the **debug ip flow cache expiration** command:

```
#debug ip flow cache expiration
#show run
interface shdsl 2/1
    16:38:37: FLOW.CACHE: Expired 10.23.197.244:23 > 172.22.77.208: 1188 out eth 0/1 <T=0/P=6>
    16:38:37: FLOW.CACHE: ^Idle Time = 60, Active Time = 60
interface adsl 1/1
    16:39:20: FLOW.CACHE: Expired 10.23.197.244.23 > 172.22.77.208:1189 out eth 0/1 <T=0/P=6>
    16:39:20: FLOW.CACHE: ^Idle Time = 60, Active Time = 90
```

The following is sample output from the **debug ip flow cache entry** command:

```
#debug ip flow cache entry
#show run
    16:52:20: FLOW.CACHE: Added 172.22.77.208: 1189 > 10.23.197.244: 23 in eth 0/1 <T=0/P=6>
```

debug ip ftp-server

Use the **debug ip ftp-server** command to activate debug messages associated with File Transfer Protocol (FTP) server events in the AOS device. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 13.1	Command was introduced.

Functional Notes

The **debug ip ftp-server** command activates debug messages to provide information on FTP server activity in AOS. The FTP server capability allows for fast file management and transport for local or remote devices.

Usage Examples

The following example activates debug messages associated with FTP server activity:

```
>enable
#debug ip ftp-server
```

debug ip icmp

Use the **debug ip icmp** command to show all Internet Control Message Protocol (ICMP) version 4 (ICMPv4) messages as they come into the router or are originated by the router. If an optional keyword (**send** or **recv**) is not used, all results are displayed. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip icmp
debug ip icmp send
debug ip icmp recv

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

send	Optional. Displays only ICMPv4 messages sent by the router.
recv	Optional. Displays only ICMPv4 messages received by the router.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following example activates the **debug ip icmp** send and receive messages for ICMPv4 in AOS:

>enable
#debug ip icmp
ICMP SEND: From (0.0.0.0) to (172.22.14.229) Type=8 Code=0 Length=72 Details:echo request
ICMP RECV: From (172.22.14.229) to (10.100.23.19) Type=0 Code=0 Length=72 Details:echo reply
ICMP SEND: From (0.0.0.0) to (172.22.14.229) Type=8 Code=0 Length=72 Details:echo request
ICMP RECV: From (172.22.14.229) to (10.100.23.19) Type=0 Code=0 Length=72 Details:echo reply
ICMP RECV: From (172.22.255.200) to (10.100.23.19) Type=11 Code=0 Length=36 Details:TTL equals 0 during transit
ICMP RECV: From (172.22.14.229) to (10.100.23.19) Type=3 Code=3 Length=36 Details:port unreachable
ICMP RECV: From (172.22.14.229) to (10.100.23.19) Type=3 Code=3 Length=36 Details:port unreachable

debug ip igmp

Use the **debug ip igmp** command to enable debug messages for Internet Group Management Protocol (IGMP) transactions (including helper activity). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip igmp
debug ip igmp <*ip address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*ip address*>	Optional. Specifies the IP address of a multicast group. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 7.1	Command was introduced.

Usage Examples

The following example enables IGMP debug messages for the specified multicast group:

>**enable**
#debug ip igmp 224.1.1.1

debug ip igmp snooping

Use the **debug ip igmp snooping** command to enable debug messages for Internet Group Management Protocol (IGMP) snooping errors and events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip igmp snooping
debug ip igmp snooping verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

verbose	Optional. Enables detailed debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 12.1	Command was introduced.

Usage Examples

The following example enables IGMP snooping debug messages:

>enable
#debug ip igmp snooping

debug ip mrouting

Use the **debug ip mrouting** command to activate debug messages associated with multicast table routing events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 10.1	Command was introduced.

Usage Examples

The following sample activates **ip mrouting** debug messages:

```
>enable
#debug ip mrouting
```

debug ip nhrp

Use the **debug ip nhrp** command to activate debug messages associated with Next Hop Resolution Protocol (NHRP) operations. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip nhrp
debug ip nhrp events
debug ip nhrp packets

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Optional. Limits output to NHRP events.
packets	Optional. Limits output to NHRP packets.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.7.0	Command was introduced.

Usage Examples

The following example enables debug messages associated with NHRP:

```
>enable
#debug ip nhrp
18:21:32 NHRP tunnel 1: No reply for registration request to 10.10.10.254 after 16s, resending
18:21:33 NHRP tunnel 1: Error indication received from 10.10.10.254
```

debug ip ospf

Use the **debug ip ospf** command to activate debug messages associated with Open Shortest Path First version 2 (OSPFv2) routing operations. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip ospf
debug ip ospf adj
debug ip ospf database-timer
debug ip ospf events
debug ip ospf flood
debug ip ospf hello
debug ip ospf lsa-generation
debug ip ospf packet
debug ip ospf retransmission
debug ip ospf spf
debug ip ospf tree

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

adj	Optional. Displays OSPF adjacency events.
database-timer	Optional. Displays OSPF database timer.
events	Optional. Displays OSPF events.
flood	Optional. Displays OSPF flooding.
hello	Optional. Displays OSPF hello events.
lsa-generation	Optional. Displays OSPF link state advertisement (LSA) generation.
packet	Optional. Displays OSPF packets.
retransmission	Optional. Displays OSPF retransmission events.
spf	Optional. Displays OSPF shortest path first (SPF) calculations.
tree	Optional. Displays OSPF database tree.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following is an example of **debug ip ospf** command results:

>**enable**
#debug ip ospf flood
OSPF: Update LSA: id=c0a8020d rtid=192.168.2.13 area=11.0.0.0 type=1
OSPF: Update LSA: id=0b003202 rtid=11.0.50.2 area=11.0.0.0 type=1
OSPF: Queue delayed ACK lasid=0b003202 lsartid=11.0.50.2 nbr=11.0.50.2
OSPF: Rx ACK lasid=c0a8020d lsartid=192.168.2.13 nbr=11.0.50.2
OSPF: Received LSA ACK LSA_ID=-64.-88.2.13 LSA_RT_ID=-64.-88.2.13
OSPF: Rx ACK lasid=00000000 lsartid=192.168.2.13 nbr=11.0.50.2
OSPF: Received LSA ACK LSA_ID=0.0.0.0 LSA_RT_ID=-64.-88.2.13
OSPF: Sending delayed ACK
OSPF: Update LSA: id=c0a8020d rtid=192.168.2.13 area=11.0.0.0 type=1
OSPF: Flooding out last interface
OSPF: Update LSA: id=0b003202 rtid=11.0.50.2 area=11.0.0.0 type=1

debug ip packet

Use the **debug ip packet** command to display debug messages for every Internet Protocol version 4 (IPv4) packet forwarded through the unit. Adding the VRF name to this command displays debug information only for the named virtual routing and forwarding (VRF) instance. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip packet
debug ip packet detail
debug ip packet dump
debug ip packet <*ipv4 acl name*>
debug ip packet <*ipv4 acl name*> **detail**
debug ip packet <*ipv4 acl name*> **dump**
debug ip packet any-vrf
debug ip packet any-vrf <*ipv4 acl name*>
debug ip packet any-vrf <*ipv4 acl name*> **detail**
debug ip packet any-vrf <*ipv4 acl name*> **dump**
debug ip packet any-vrf detail
debug ip packet any-vrf dump
debug ip packet vrf <*name*>
debug ip packet vrf <*name*> <*acl name*>
debug ip packet vrf <*name*> <*acl name*> **detail**
debug ip packet vrf <*name*> <*acl name*> **dump**
debug ip packet vrf <*name*> **detail**
debug ip packet vrf <*name*> **dump**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

detail	Optional. Displays IPv4 packet detailed information.
dump	Optional. Displays IPv4 packet detailed information, as well as a hex dump of the packets payload. **Note**: The console stream can be captured to a log file and used as an input file for display with ETHEREAL/Wireshark by using **text2pcap.exe**, which is a part of the ETHEREAL/Wireshark distribution. Execute as follows: **text2pcap -l 101** <*input_file*> <*output_file*>

	Next, open the output file with ETHEREAL/Wireshark for display and decode. The typical lower layer information in ETHEREAL/Wireshark may not be present. This converted capture file is treated as a raw IP capture and also has no timestamp data. Remember to take advantage of access control lists (ACLs) to narrow down the amount of data being processed with this facility. This is a CPU-intensive operation, and also disables any fast flow/fast cache routing.
<ipv4 acl name>	Optional. Displays debug information for a specific IPv4 ACL.
any-vrf	Optional. Displays debug information for all VRFs, including the default.
vrf *<name>*	Optional. Displays debug information for the specified VRF.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 12.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output for the **debug ip packet** command, which provides debug information for the default VRF only:

>**enable**
#debug ip packet

IP: s= 192.168.8.101 (eth 0/1) d=192.168.7.2 (eth 0/2) g= 192.168.7.2, forward
IP: s= 192.168.7.2 (eth 0/2) d=192.168.8.101 (eth 0/1) g= 192.168.8.101, forward
IP: s= 192.168.8.101 (eth 0/1) d=192.168.7.2 (eth 0/2) g= 192.168.7.2, forward
IP: s= 192.168.7.2 (eth 0/2) d=192.168.8.101 (eth 0/1) g= 192.168.8.101, forward

Where:

s=192.168.8.101 (eth 0/1) indicates source address and interface of received packet.
d=192.168.7.2 (eth 0/2) indicates destination address and interface from which the packet is being sent.
g=192.168.7.2 indicates the address of the next-hop gateway.
forward indicates the router is forwarding this packet.

The following is sample output for the **debug ip packet vrf** <*name*> command for the VRF named **Red**:

```
>enable
#debug ip packet vrf RED

IP: s=192.168.1.100 (eth 0/1.4) d=192.168.1.255 (Loopback), vrf=RED, rcvd
IP: s=192.168.1.101 (eth 0/1.4) d=192.168.1.1 (Loopback), vrf=RED, rcvd
IP: s=192.168.1.1 (Loopback) d=192.168.1.101 (eth 0/1.4) g=192.168.1.101, vrf=RED, forward
IP: s=192.168.1.100 (eth 0/1.4) d=192.168.1.1 (Loopback), vrf=RED, rcvd
IP: s=192.168.1.1 (Loopback) d=192.168.1.100 (eth 0/1.4) g=192.168.1.100, vrf=RED, forward
```

Where:

rcvd indicates the router received this packet.

The following is sample output for the **debug ip packet any-vrf** command:

```
>enable
#debug ip packet any-vrf

IP: s=192.168.1.15 (eth 0/1.1) d=192.168.1.1 (Loopback), rcvd
IP: s=192.168.1.1 (Loopback) d=192.168.1.15 (eth 0/1.1) g=192.168.1.15, forward
IP: s=192.168.1.101 (eth 0/1.4) d=255.255.255.255 (Loopback), vrf=RED, rcvd
IP: s=192.168.1.1 (Loopback) d=192.168.1.101 (eth 0/1.4) g=192.168.1.101, vrf=RED, forward
IP: s=192.168.2.33 (eth 0/1.3) d=192.168.2.1 (Loopback), vrf=BLU, rcvd
IP: s=192.168.2.1 (Loopback) d=192.168.2.33 (eth 0/1.3) g=192.168.2.33, vrf=BLU, forward
IP: s=192.168.1.101 (eth 0/1.4) d=192.168.1.1 (Loopback), vrf=RED, rcvd
IP: s=192.168.1.1 (Loopback) d=192.168.1.101 (eth 0/1.4) g=192.168.1.101, vrf=RED, forward
```

Where:

if the **vrf=**<*name*> statement is not present, the packet was present on the default VRF.
vrf=<*name*> indicates the nondefault VRF from which the packet was received.
forward indicates the router transmitted this packet.
g=x.x.x.x indicates the next-hop IP address to which the packet was forwarded.

debug ip pim-sparse

Use the **debug ip pim-sparse** command to display all protocol-independent multicast (PIM) sparse mode information. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates all PIM sparse mode messages:

```
>enable
#debug ip pim-sparse
```

debug ip pim-sparse assert

Use the **debug ip pim-sparse assert** command to display debug messages associated with protocol-independent multicast (PIM) sparse assert transactions. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip pim-sparse assert
debug ip pim-sparse assert event
debug ip pim-sparse assert event <*multicast address*>
debug ip pim-sparse assert state
debug ip pim-sparse assert state <*multicast address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

event	Optional. Displays PIM sparse assert events.
state	Optional. Displays PIM sparse assert state changes.
<*multicast address*>	Optional. Specifies multicast group IP address to filter. The multicast group IP address range is **244.0.0.0** to **239.255.255.255** or **224.0.0.0 /4**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates all PIM sparse assert event messages:

>enable
#debug ip pim-sparse assert event
14:25:05: PIMSM: Assert - MRoute (*, 239.255.255.250, eth 0/2) processed Received Join in NoInfo state
14:25:29: PIMSM: Assert - MRoute (10.100.13.240, 239.192.19.136, eth 0/2) processed Received Join in NoInfo state
14:25:29: PIMSM: Assert - MRoute (*, 239.192.19.136, eth 0/2) processed Received Join in NoInfo state
14:26:05: PIMSM: Assert - MRoute (*, 239.255.255.250, eth 0/2) processed Received Join in NoInfo state

debug ip pim-sparse hello

Use the **debug ip pim-sparse hello** command to display protocol-independent multicast (PIM) sparse mode hello transactions. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates PIM sparse mode hello messages:

```
>enable
#debug ip pim-sparse hello
```

debug ip pim-sparse joinprune

Use the **debug ip pim-sparse joinprune** command to display protocol-independent multicast (PIM) sparse mode join and prune transactions. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip pim-sparse joinprune
debug ip pim-sparse joinprune event
debug ip pim-sparse joinprune event <*multicast address*>
debug ip pim-sparse joinprune state
debug ip pim-sparse joinprune state <*multicast address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

event	Optional. Displays PIM sparse join and prune events.
state	Optional. Displays PIM sparse join and prune state changes.
<*multicast address*>	Optional. Specifies multicast group IP address to filter. The multicast group IP address range is **244.0.0.0** to **239.255.255.255** or **224.0.0.0 /4**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates PIM sparse mode messages for all join and prune events and state changes:

>enable
#debug ip pim-sparse joinprune
14:27:05: PIMSM: Processed JOIN(*, 239.255.255.250) from 10.10.10.2
14:27:29: PIMSM: Processed JOIN(10.100.13.240, 239.192.19.136) from 10.10.10.2
14:27:29: PIMSM: Processed JOIN(*, 239.192.19.136) from 10.10.10.2
14:27:56: PIMSM: Sent JOIN(10.100.13.240, 239.192.19.136) to 10.100.13.240
14:28:05: PIMSM: Processed JOIN(*, 239.255.255.250) from 10.10.10.2

debug ip pim-sparse packets

Use the **debug ip pim-sparse packets** command to display protocol-independent multicast (PIM) sparse mode packet information. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.Variations of this command include:

debug ip pim-sparse packets
debug ip pim-sparse packets in
debug ip pim-sparse packets in *<interface>*
debug ip pim-sparse packets out
debug ip pim-sparse packets out *<interface>*

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

in	Optional. Displays messages for inbound PIM sparse packets.
out	Optional. Displays messages for outbound PIM sparse packets.
<interface>	Optional. Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **debug ip pim-sparse packets ?** for a list of valid interfaces.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Usage Examples

The following example activates all PIM sparse packet messages (both inbound and outbound):

>enable
#debug ip pim-sparse packets

debug ip pim-sparse register

Use the **debug ip pim-sparse register** command to display protocol-independent multicast (PIM) sparse source registration messages. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip pim-sparse register
debug ip pim-sparse register event
debug ip pim-sparse register event <*multicast address*>
debug ip pim-sparse register state
debug ip pim-sparse register state <*multicast address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

event	Optional. Displays PIM sparse register events.
state	Optional. Displays PIM sparse register state changes.
<*multicast address*>	Optional. Specifies multicast group IP address to filter. The multicast group IP address range is **244.0.0.0** to **239.255.255.255** or **224.0.0.0 /4**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates all PIM sparse registration changes:

>enable
#debug ip pim-sparse register
18:14:22: PIMSM: Registered new source (10.100.13.240, 239.192.19.136) from 10.10.10.1
18:14:22: PIMSM: RegisterStop(10.100.13.240, 239.192.19.136) sent to 10.10.10.1
18:14:53: PIMSM: RegisterStop(10.100.13.240, 239.192.19.136) sent to 10.10.10.1
18:16:17: PIMSM: RegisterStop(10.100.13.240, 239.192.19.136) sent to 10.10.10.1

debug ip policy

Use the **debug ip policy** command to display policy-based routing events. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug ip policy
debug ip policy <*acl name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*acl name*>	Optional. Displays debug information only for the specified access control list (ACL).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.
Release 16.1	Command was expanded to filter based on an ACL.

Usage Examples

The following example creates a standard ACL named **PVT**, which permits packets sourced from the 10.22.0.0/16 network and displays only these policy-based routing event messages:

>enable
#ip access-list standard PVT
#permit 10.22.0.0 0.0.255.255
#deny any
#debug ip policy PVT

debug ip rip

Use the **debug ip rip** command to activate debug messages associated with Routing Information Protocol (RIP) operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip rip
debug ip rip events

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Optional. Displays only RIP protocol events.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 1.1	Command was introduced.

Functional Notes

The **debug ip rip** command activates debug messages to provide information on RIP activity in AOS. RIP allows hosts and routers on a network to exchange information about routes.

Usage Examples

The following example activates debug messages associated with RIP activity:

>enable
#debug ip rip

debug ip route-cache express

Use the **debug ip route-cache express** command to activate debug messages associated with Layer 3 switching.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following is sample output for this command:

```
>enable
#debug ip route-cache express
xRt: Periodic ARP for 10.2.42.254
xRt: Processed 1 ARP events, with 0 remaining

xRt: host entry added: IP=192.168.1.10, MAC=00:10:94:00:00:01, Vlan=1
xRt: host entry added: IP=192.168.3.10, MAC=00:10:95:00:00:01, Vlan=3
xRt: host entry not added (no ARL entry): IP=192.168.5.10, MAC=00:10:96:00:00:01, Vlan=5
xRt: host entry added: IP=192.168.7.10, MAC=00:10:97:00:00:01, Vlan=7
xRt: host entry added: IP=192.168.9.10, MAC=00:10:98:00:00:01, Vlan=9
xRt: host entry added: IP=192.168.11.10, MAC=00:10:99:00:00:01, Vlan=11
xRt: host entry added: IP=192.168.13.10, MAC=00:10:9a:00:00:01, Vlan=13
xRt: host entry not added (no ARL entry): IP=192.168.15.10, MAC=00:10:9b:00:00:01, Vlan=15
xRt: host entry added: IP=192.168.17.10, MAC=00:10:9c:00:00:01, Vlan=17
xRt: host entry added: IP=192.168.19.10, MAC=00:10:9d:00:00:01, Vlan=19
xRt: Processed 10 ARP events, with 605 remaining
xRt: Processed 10 L2 events, with 393 remaining

xRt: host entry added (ARL entry found): IP=192.168.1.20, MAC=00:10:94:00:00:0b, Vlan=1
xRt: host entry added (ARL entry found): IP=192.168.15.10, MAC=00:10:9b:00:00:01, Vlan=15
xRt: host entry added (ARL entry found): IP=192.168.3.18, MAC=00:10:95:00:00:09, Vlan=3
xRt: host entry added (ARL entry found): IP=192.168.3.41, MAC=00:10:95:00:00:20, Vlan=3
xRt: Processed 10 L2 events, with 217 remaining
--MORE--
```

debug ip routing

Use the **debug ip routing** command to activate debug messages associated with Internet Protocol version 4 (IPv4) routing table events. Adding the VRF name to this command displays debug information for the named virtual routing and forwarding (VRF). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug ip routing
debug ip routing vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information only for the specified VRF. If a VRF is not specified, the default VRF is assumed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 10.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates debug messages associated with IPv4 routing table events:

>enable
#debug ip routing

The following example activates the debug messages associated with IPv4 routing table events on the nondefault VRF named **RED** and provides sample output:

>**enable**
#debug ip routing vrf RED

ip route vrf RED 1.2.3.0 255.255.255.0 192.168.10.10
15:32:29: ROUTING: Add route for 1.2.3.0/24 nh=192.168.10.10 vrf=RED
15:32:29: ROUTING: Remove route for 1.2.3.0/24 nh=192.168.10.10 vrf=RED
15:32:29: ROUTING: Add route for 1.2.3.0/24 nh=192.168.10.10 vrf=RED
15:32:29: ROUTING: Remove route for 1.2.3.0/24 nh=192.168.10.10 vrf=RED
15:32:29: ROUTING: Add route for 1.2.3.0/24 nh=192.168.10.10 vrf=RED

Where:

nh=192.168.10.10 indicates the next-hop address.
vrf=RED indicates the nondefault VRF where the route is present.

debug ip security monitor

Use the **debug ip security monitor** command to activate debug messages associated with the IP security monitor. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.5	Command was introduced.

Functional Notes

The **debug ip security monitor** events include statistic collection associated with the timeline.

Usage Examples

The following is sample output for this command:

>**enable**
#debug ip security monitor
SECURITY_MONITOR.EVENTS Regular update: timeline interval scheduled to end at 23:00:16
SECURITY_MONITOR.EVENTS [curr=269095, sched=272343]
SECURITY_MONITOR.EVENTS Regular update: timeline interval scheduled to end at 23:00:16
SECURITY_MONITOR.EVENTS [curr=269154, sched=272343] **no debug ip security monitor**
#

debug ip tcp

Use the **debug ip tcp** command to activate debug messages associated with Transmission Control Protocol (TCP) state changes, session allocation and deallocation, and packet information (for example, sequence numbers, acknowledgement numbers, and packet length) in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip tcp
debug ip tcp events
debug ip tcp md5

These debug events are logged for packets that are sent or received from the router. Forwarded TCP packets are not included.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Optional. Displays only messages regarding TCP state changes and TCP session allocation.
md5	Optional. Displays messages related to the TCP Message Digest 5 (MD5) authentication process.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 4.1	Command was introduced.
Release 9.1	Command was expanded to include the **md5** parameter.

Functional Notes

The debug events for this command are logged for packets that are sent or received from the router. Forwarded TCP packets are not included in the output.

In the **debug ip tcp events** output, TCB stands for TCP task control block. The numbers which sometimes appear next to TCB (e.g., **TCB5** in the following example) represent the TCP session number. This allows you to differentiate debug messages for multiple TCP sessions.

Output for the **debug ip tcp md5** command can include messages such as: *MD5 authentication was expected but not received, MD5 authentication was not expected but was received, MD5 authentication failed, and MD5 authentication passed.* Debug messages will only be generated for TCP ports that have MD5 authentication enabled.

Usage Examples

The following is sample output for this command:

>**enable**
#debug ip tcp events
2003.02.17 07:40:56 IP.TCP EVENTS TCP: Allocating block 5
2003.02.17 07:40:56 IP.TCP EVENTS TCB5: state change: FREE->SYNRCVD
2003.02.17 07:40:56 IP.TCP EVENTS TCB5: new connection from 172.22.75.246:3473 to 10.200.2.201:23
2003.02.17 07:40:56 IP.TCP EVENTS TCB5: state change: SYNRCVD->ESTABLISHED [172.22.75.246:3473]
2003.02.17 07:41:06 IP.TCP EVENTS TCB5: Connection aborted -- error = RESET
2003.02.17 07:41:06 IP.TCP EVENTS TCB5: De-allocating tcb

debug ip tftp

Use the **debug ip tftp** command to activate debug messages associated with Trivial File Transfer Protocol (TFTP) packets. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip tftp client packets
debug ip tftp server events
debug ip tftp server packets

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

client packets	Activates TFTP client packet debug messages.
server events	Activates TFTP server event debug messages.
server packets	Activates TFTP server packet debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.
Release 14.1	Command changed from **debug tftp** to **debug ip tftp**.

Usage Examples

The following example activates debug messages associated with TFTP server packets:

>enable
#debug ip tftp server packets

debug ip udp

Use the **debug ip udp** command to activate debug messages associated with User Datagram Protocol (UDP) send and receive events in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

These debug events are logged for packets that are sent or received from the router. Forwarded UDP packets are not included.

The overhead associated with this command takes up a large portion of your router's resources and at times can halt other router processes. It is best to only use the command during times when the network resources are in low demand (nonpeak hours, weekends, etc.).

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 4.1	Command was introduced.

Functional Notes

In the **debug ip udp** information, the message **no listener** means that there is no service listening on this UDP port (i.e., the data is discarded).

Usage Examples

The following is sample output for this command:

```
>enable
#debug ip udp
2003.02.17 07:38:48 IP.UDP RX: src=10.200.3.236:138, dst=10.200.255.255:138, 229 bytes, no listener
2003.02.17 07:38:48 IP.UDP RX: src=10.200.2.7:138, dst=10.200.255.255:138, 227 bytes, no listener
2003.02.17 07:38:48 IP.UDP RX: src=10.200.201.240:138, dst=10.200.255.255:138, 215 bytes, no
    listener
```

debug ip urlfilter

Use the **debug ip urlfilter** command to display a summary of debug information for all uniform resource locator (URL) filters being used. Debug messages are displayed (real time) to the terminal (or Telnet) screen. The verbose option gives more detailed information. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ip urlfilter
debug ip urlfilter verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

verbose	Optional. Enables detailed debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 12.1	Command was introduced.

Usage Examples

The following example shows the debug summary for all URL filters being used:

>enable
#debug ip urlfilter

2005.11.06 05:31:52 Connected to a Websense server
2005.11.06 05:33:26 Allowed http://www.adtran.com/

debug ip urlfilter top-websites

Use the **debug ip urlfilter top-websites** command to display the times at which the generated top websites lists merge (as the 15-minute list is rolled into the hourly list, the hourly list into the daily list, and so on). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example shows the debug summary for top websites reporting:

```
>enable
#debug ip urlfilter top-websites
P2007.05.08 09:55:00 Merging displayed 15 minute list into hour list
2007.05.08 09:55:00 Merging hour list into twenty-four hour list
2007.05.08 09:55:00 Validating timers; timerAdj=0, update=0, lastThen=462
2007.05.08 09:55:00 Scheduled next run in 900; timerAdj=0, nowUpTime=462,
last Period=306
```

debug ipv6 crypto ipsec

Use the **debug ipv6 crypto ipsec** command to activate debug messages associated with Internet Protocol version 6 (IPv6) IP security (IPsec) events within the cryptographic subsystem. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 crypto ipsec
debug ipv6 crypto ipsec vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, information for the default VRF is displayed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.5.0	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates the debug messages for IPv6 cryptographic subsystem processing:

>**enable**
#debug ipv6 crypto ipsec

debug ipv6 dhcp

Use the **debug ipv6 dhcp** command to enable debug messages for Dynamic Host Control Protocol version 6 (DHCPv6) operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 dhcp
debug ipv6 dhcp client
debug ipv6 dhcp client <*interface*>
debug ipv6 dhcp client mef-ethernet <*slot/port*>
debug ipv6 dhcp client system-control-evc
debug ipv6 dhcp client system-management-evc
debug ipv6 dhcp detail
debug ipv6 dhcp relay
debug ipv6 dhcp relay vrf <*name*>
debug ipv6 dhcp server
debug ipv6 dhcp server vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

client	Optional. Specifies that DHCPv6 client information is displayed.
<*interface*>	Optional. Specifies that only client information for the single interface is displayed. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
mef-ethernet <*slot/port*>	Optional. Specifies that only client information for the Metro Ethernet Forum (MEF) Ethernet interface is displayed.
system-control-evc	Optional. Specifies that only client information for the system control Ethernet virtual connection (EVC) is displayed.
system-management-evc	Optional. Specifies that only client information for the system management EVC is displayed.
detail	Optional. Specifies that DHCPv6 packet content is displayed.
relay	Optional. Specifies that DHCPv6 relay information is displayed.
server	Optional. Specifies that DHCPv6 server information is displayed.
vrf <*name*>	Optional. Specifies that DHCPv6 server or relay information for a nondefault (named) virtual routing and forwarding (VRF) instance is displayed. If a VRF is not specified, information for the default VRF is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.
Release R10.9.0	Command was expanded to include the **client** parameter.
Release R10.10.0	Command was expanded to include the system control and system management EVCs.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.
Release R11.1.0	Command was expanded to include the **vrf** <*name*> parameter.

Usage Examples

The following example displays sample output for DHCPv6 relay debug information:

>**enable**
#debug ipv6 dhcp relay
2011.01.01 21:40:24 DHCPv6.RELAY Relaying SOLICIT from FE80::B098:1B0E:27CA:A8AB on eth 0/2
2011.01.01 21:40:24 DHCPv6.RELAY to FE80::2A0:C8FF:FE65:702 eth 0/1
2011.01.01 21:40:24 DHCPv6.RELAY Sending RELAY-FORWARD to FE80::2A0:C8FF:FE65:702 eth 0/1
2011.01.01 21:40:24 DHCPv6.RELAY Received RELAY-REPLY from FE80::2A0:C8FF:FE65:702 eth 0/1
2011.01.01 21:40:24 DHCPv6.RELAY Relaying RELAY-REPLY from FE80::2A0:C8FF:FE65:702 eth 0/1
2011.01.01 21:40:24 DHCPv6.RELAY to FE80::B098:1B0E:27CA:A8AB on eth 0/2
2011.01.01 21:40:24 DHCPv6.RELAY Sending REPLY to FE80::B098:1B0E:27CA:A8AB eth 0/2 on eth 0/2

debug ipv6 ffe wildcards

Use the **debug ipv6 ffe wildcards** command to enable debug messaging for Internet Protocol version 6 (IPv6) RapidRoute wildcard events. This command can be used to determine which of several subsystem configurations caused a specific RapidRoute wildcard to be disabled.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.You can view wildcard status on a per-interface basis using the command* *show ipv6 ffe on page 804*.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.10.0	Command was introduced.

Functional Notes

When RapidRoute wildcard debug messages are enabled, two wildcard events are displayed. A **calculate** event, generated when an interface is called to recalculate its inbound or outbound wildcards, displays the results for each subsystem in the order in which wildcard processing is completed. A **finalize set** event is generated when the complete wildcards for an interface are pushed to either hardware or software processing and the new wildcards are used.

The order of wildcard bits displayed in a wildcard debug message are the opposite of the order displayed in the **show ipv6 ffe wildcard** command, and exclude the Destination IP Address (which cannot be wildcarded). The last bit displayed at the end of the wildcard string is the least significant bit and represents the Source IP Address.

Usage Examples

The following example enables RapidRoute wildcard debug messaging and provides sample event output. Also included in the example are the configuration of the IPv6 access control list (ACL) named **ACL** and its application to the gigabit Ethernet subinterface **0/5.1**:

>**enable**
#debug ipv6 ffe wildcards
#config t
(config)**#ipv6 access-list extended ACL**
(config-ext-nacl)**#permit icmpv6 any any echo**
(config-ext-nacl)**#exit**
(config)**#interface gigabit ethernet 0/5.1**
(config-giga-eth 0/5.1)**#ipv6 access-group ACL out**

```
2015.01.01 12:00:34 FFEWILDCARDV6.giga-eth 0/5.1 calculate outbound:
    QoS:                    11111111111
    AccessGroup:            11011110111
2015.01.01 12:00:34 FFEWILDCARDV6.Loopback finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV6.null 0 finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV6.giga-eth 0/2.1 finalize set: 11011110111
2015.01.01 12:00:34 FFEWILDCARDV6.giga-eth 0/5.1 finalize set: 11011110111
```

debug ipv6 firewall

Use the **debug ipv6 firewall** command to activate debug messages associated with AOS Internet Protocol version 6 (IPv6) firewall operation. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 firewall
debug ipv6 firewall vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, information for the default VRF is displayed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.1	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates the debug messages for IPv6 firewall processing:

>**enable**
#debug ipv6 firewall

The following example activates the IPv6 firewall debug messages for the VRF instance **gray** and provides sample output:

>**enable**
#debug ipv6 firewall vrf gray

2010.08.17 20:39:25 FIREWALL_V6.VRF gray id=firewall time=”2010-08-17 20:39:25” fw=NV3430 pri=6 proto=icmpv6 src=2001:DB8:1:1::2 dst=2001:DB8:1:1::1 msg=”ICMPv6 type=128 code=0; Bytes processed over policy-session (bytes=256) from PRIVATEV6 policy-class on the interface eth 0/1.1”
2010.08.17 20:39:25 FIREWALL_V6.VRF gray Deleted policy-session due to clear all policy-sessions command
Policy-session ID = 2; Count (total, policy-class) = 0, 0
Protocol = 58; Flags = 0x1; Timeout = 60
Initiating side: Policy-class = PRIVATEV6
From/To: eth 0/1.1 -> Loopback
Source: 2001.DB8:1:1::2
Destination: 2001:DB8:1:1::1
ICMPv6 Type/Code: 128/0; ID: 0
Responding side: Policy-class = self
From/To: Loopback -> eth 0/1.1
Source: 2001:DB8:1:1::2
Destination: 2001:DB8:1:1::2
ICMPv6 Type/Code: 129/0; ID: 0

debug ipv6 firewall ndar

Use the **debug ipv6 firewall ndar** command to activate debug messages associated with AOS Internet Protocol version 6 (IPv6) firewall Neighbor Discovery (ND) operation. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 firewall ndar
debug ipv6 firewall vrf <*name*> **ndar**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

ndar	Specifies that ND address resolution events are displayed.
vrf <*name*>	Optional. Displays debug information for the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, information for the default VRF is displayed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.3	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates the debug messages for IPv6 firewall ND address resolution processing on the default VRF instance:

>**enable**
#debug ipv6 firewall ndar

debug ipv6 icmp

Use the **debug ipv6 icmp** command to show all Internet Control Message Protocol (ICMP) version 6 (ICMPv6) messages being sent or received by the local IPv6 stack. For IPv6, these messages do not include ICMP packets being exchanged between other devices because those packets appear only as IPv6 packets (rather than ICMPv6 packets) to the local router. If an optional keyword (**send** or **recv**) is not used, all results are displayed. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 icmp
debug ipv6 icmp send
debug ipv6 icmp recv

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

send	Optional. Displays only ICMPv6 messages sent by the IPv6 stack.
recv	Optional. Displays only ICMPv6 messages received by the IPv6 stack.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.1	Command was introduced.

Usage Examples

The following example activates the **debug ipv6 icmp** send and receive messages for ICMPv6 in AOS:

```
>enable
#debug ipv6 icmp
ICMPv6 SEND: To [2001:DB8:8967::10] Type=128 Code=0 Length=108 Details:echo request
    id=0036 seq=0001
ICMPv6 SEND: Source changed to [2001:DB8:8967:1::100] before transmit
ICMPv6 RECV: From [1001:DB8:8967::10] to [2001:DB8:8967:1::100] [eth 0/1]
Type=129 Code=0 Length=108 Details: echo reply
    id=0036 seq=0001
--MORE--
```

debug ipv6 mld

Use the **debug ipv6 mld** command to display information related to Internet Protocol version 6 (IPv6) Multicast Listener Discovery (MLD) queries and responses. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 mld events
debug ipv6 mld events interface <*interface*>
debug ipv6 mld packet
debug ipv6 mld packet interface <*interface*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Specifies that events related to MLD activity, such as timer starts or changes in compatibility mode, are displayed.
packet	Specifies that decoded packet information, including MLD message contents and associated MLD groups, are displayed.
interface <*interface*>	Optional. Limits command output to a specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.

Default Values

No default values are necessary for this command.

Command History

Release R11.4.0	Command was introduced.

Usage Examples

The following example displays sample output for MLD debug information:

```
>enable
#debug ipv6 mld
    2014.04.20 17:58:05 MLD.PKT giga-eth 0/2.1 Receive MLD packet, len=28
    type=130 (query), code=0, cksum=0x231d
    maxDelayMs=5000, mcast=:: (general)
    sFlag=0, QRV=2, QQIC=30, numSources=0
    2014.04.20 17:58:05 MLD.PKT giga-eth 0/2.1 Transmit MLD packet, len=88
    type=143 (v2 report), code=0, cksum=0x8f49
```

debug ipv6 named-prefix

Use the **debug ipv6 named-prefix** command to enable debug messages for all events associated with Internet Protocol version 6 (IPv6) named prefixes.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.9.0	Command was introduced.

Usage Examples

The following example enables debug messages for all IPv6 named prefixes:

```
>enable
#debug ipv6 named-prefix
```

debug ipv6 nd

Use the **debug ipv6 nd** command to activate debug messages for Internet Protocol version 6 (IPv6) Neighbor Discovery (ND) functions on the router. This command details the processing of ND messages and all resulting state changes and errors. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 nd ar
debug ipv6 nd dad
debug ipv6 nd neighbor-state
debug ipv6 nd packet neighbor
debug ipv6 nd packet router

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

ar	Optional. Activates debug messaging for address resolution (AR) changes.
dad	Optional. Activates debug messaging for duplicate address detection (DAD) events.
neighbor-state	Optional. Activates debug messaging for state changes in the neighbor cache.
packet neighbor	Optional. Activates debug messaging for ND packets.
packet router	Optional. Activates debug messaging for router advertisement (RA) packets.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.1	Command was introduced.

Usage Examples

The following example activates debug messaging for all ND DAD events:

>**enable**
#debug ipv6 nd dad

debug ipv6 packet

Use the **debug ipv6 packet** command to display debug messages for every Internet Protocol version 6 (IPv6) packet forwarded through the unit. Adding the virtual routing and forwarding (VRF) instance name to this command displays debug information only for the named VRF instance. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ipv6 packet
debug ipv6 packet detail
debug ipv6 packet dump
debug ipv6 packet <*ipv6 acl name*>
debug ipv6 packet <*ipv6 acl name*> **detail**
debug ipv6 packet <*ipv6 acl name*> **dump**
debug ipv6 packet any-vrf
debug ipv6 packet any-vrf <*ipv6 acl name*>
debug ipv6 packet any-vrf <*ipv6 acl name*> **detail**
debug ipv6 packet any-vrf <*ipv6 acl name*> **dump**
debug ipv6 packet any-vrf detail
debug ipv6 packet any-vrf dump
debug ipv6 packet vrf <*name*>
debug ipv6 packet vrf <*name*> <*acl name*>
debug ipv6 packet vrf <*name*> <*acl name*> **detail**
debug ipv6 packet vrf <*name*> <*acl name*> **dump**
debug ipv6 packet vrf <*name*> **detail**
debug ipv6 packet vrf <*name*> **dump**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

detail	Optional. Displays IPv6 packet detailed information.
dump	Optional. Displays IPv6 packet detailed information, as well as a hex dump of the packets payload.
<*ipv6 acl name*>	Optional. Displays debug information for a specific IPv6 access control list (ACL).
any-vrf	Optional. Displays debug information for all VRFs, including the default.
vrf <*name*>	Optional. Displays debug information for the specified VRF.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.7.0	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output for the **debug ipv6 packet** command, which provides debug information for the default VRF only:

>**enable**
#debug ip packet

IPv6: s=FE80::2A0:C8FF:FE00:6120 (Loopback)
d=FF02::5 (eth 0/1)
g=FF02::5
forward, size = 76(36)

IPv6: s=FE80::2A0:C8FF:FE00:6120 (Loopback)
d=2620:106:A001:899:4DC8:275B:34AA:99F6 (eth 0/1)
g=2620:106:A001:899:4DC8:275B:34AA:99F6
forward, size = 72(32)

In this example, the following is true:

s=FE80::2A0:C8FF:FE00:6120 (Loopback) indicates the source address and interface of received packet.
d=FF02::5 (eth 0/1) indicates the destination address and interface from which the packet is being sent.
g=FF02::5 indicates the address of the next-hop gateway.
forward indicates the router is forwarding this packet.

debug ipv6 routing

Use the **debug ipv6 routing** command to activate debug messages associated with Internet Protocol version 6 (IPv6) routing table events. Adding the VRF name to this command displays debug information for the named virtual routing and forwarding (VRF). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug ipv6 routing
debug ipv6 routing vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

vrf <*name*>	Optional. Displays debug information only for the specified VRF. If a VRF is not specified, the default unnamed VRF is assumed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 18.1	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example activates debug messages associated with IPv6 routing table events:

>**enable**
#debug ipv6 routing

debug isdn

Use the **debug isdn** command to activate debug messages associated with integrated services digital network (ISDN) events in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug isdn cc-ie
debug isdn cc-ie bri
debug isdn cc-ie bri <*number*>
debug isdn cc-ie pri
debug isdn cc-ie pri <*number*>
debug isdn cc-messages
debug isdn cc-messages bri
debug isdn cc-messages bri <*number*>
debug isdn cc-messages pri
debug isdn cc-messages pri <*number*>
debug isdn endpoint
debug isdn endpoint bri
debug isdn endpoint bri <*number*>
debug isdn endpoint pri
debug isdn endpoint pri <*number*>
debug isdn interface
debug isdn interface bri
debug isdn interface bri <*number*>
debug isdn interface pri
debug isdn interface pri <*number*>
debug isdn l2-formatted
debug isdn l2-formatted bri
debug isdn l2-formatted bri <*number*>
debug isdn l2-formatted pri
debug isdn l2-formatted pri <*number*>
debug isdn l2-messages
debug isdn l2-messages bri
debug isdn l2-messages bri <*number*>
debug isdn l2-messages pri
debug isdn l2-messages pri <*number*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

bri	Optional. Specifies the basic rate interface (BRI) interface.
cc-ie	Displays call control information elements.

cc-messages	Displays call control messages.
endpoint	Displays endpoint events.
interface	Displays ISDN interface events.
l2-formatted	Displays Layer 2 formatted messages.
l2-messages	Displays Layer 2 messages.
pri	Optional. Specifies the ISDN interface.
pri <*number*>	Optional. Specifies a specific ISDN interface. Range is **1** to **255**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.
Release R10.5.0	Command was expanded to include the **bri** parameter.

Usage Examples

The following example activates all Layer 2 formatted messages:

>**enable**
#debug isdn l2-formatted

The following example activates Layer 2 formatted messages received on ISDN interface primary rate interface (PRI) 1:

>**enable**
#debug isdn l2-formatted pri 1

debug isdn group

Use the **debug isdn group** command to activate integrated services digital network (ISDN) group errors and messages. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug isdn group
debug isdn group <*number*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*number*>	Optional. Specifies the ISDN group. Valid range is **1** to **255**.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages for all ISDN groups:

>enable
#debug isdn group

debug isdn resource-manager

Use the **debug isdn resource-manager** command to activate integrated services digital network (ISDN) resource manager errors and messages. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with the ISDN resource manager:

```
>enable
#debug isdn resource-manager
```

debug isdn verbose

Use the **debug isdn verbose** command to activate all debug messages associated with integrated services digital network (ISDN) events in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates all debug messages associated with ISDN activity:

```
>enable
#debug isdn verbose
```

debug licensing

Use the **debug licensing** command to display licensing event messages. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.8.0	Command was introduced.

Usage Examples

The following example activates licensing event messages:

```
>enable
#debug licensing
```

debug lldp

Use the **debug lldp** command to display debug output for all Link Layer Discovery Protocol (LLDP) receive and transmit packets. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug lldp
debug lldp rx
debug lldp rx verbose
debug lldp tx
debug lldp tx verbose
debug lldp verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

rx	Optional. Shows information about received packets.
tx	Optional. Shows information about transmitted packets.
verbose	Optional. Shows detailed debugging information.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.
Release R11.5.0	Command was expanded to include inventory information if transmitted by the endpoint.

Usage Examples

The following example activates both transmit and receive messages associated with LLDP operation:

>enable
#debug lldp

debug mail-client

Use the **debug mail-client** command to enable mail agent debug messages. Variations of this command include:

debug mail-client
debug mail-client *<agent name>*

> *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

<agent name>	Optional. Specifies debug messages are enabled only for the specified mail agent.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example enables debug messaging for all configured mail agents:

>enable
#debug mail-client

debug mef config

Use the **debug mef config** command to enable debug messaging for all Metro Ethernet Forum (MEF) components configured on the unit. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug mef config
debug mef config detail

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

detail	Optional. Specifies that detailed debug information is displayed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release A4.05	Command was introduced.

Usage Examples

The following example enables debug messages for all MEF component configurations:

>enable
#debug mef config

debug mgcp stack

Use the **debug mgcp stack** command to display information about the Media Gateway Control Protocol (MGCP) stack and MGCP messages. Variations of this command include:

debug mgcp stack
debug mgcp stack messages
debug mgcp stack messages summary
debug mgcp stack verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

messages	Optional. Specifies that MGCP stack messages information is displayed.
messages summary	Optional. Specifies that MGCP message summary information is displayed.
verbose	Optional. Specifies that detailed MGCP stack information is displayed.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Usage Examples

The following is sample output from the **debug mgcp stack messages summary** command:

```
#debug mgcp stack messages summary
19:20:22 MGCP.STACK MSGSUM TX: -> 47.234.101.60:2727
19:20:22 MGCP.STACK MSGSUM TX: ntfy 88 aaln/1@65.162.109.238 MGCP 1.0
19:20:22 MGCP.STACK MSGSUM RX: <- 47.234.101.60:2727
19:20:22 MGCP.STACK MSGSUM RX: 200 88 OK

19:20:22 MGCP.STACK MSGSUM RX: <- 47.234.101.60:2727
19:20:22 MGCP.STACK MSGSUM RX: RQNT 30425 aaln/1@65.162.109.238 MGCP 1.0
```

debug mgcp verbose

Use the **debug mgcp verbose** command to display detailed information about Media Gateway Control Protocol (MGCP) transmissions and receptions.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Usage Examples

The following is sample output from the **debug mgcp verbose** command:

```
#debug mgcp verbose
19:02:35 MGCP.STACK DEBUG adEndpointEvent(int=0:1, pkg=, evt=hd)
19:02:35 MGCP.STACK MSG TX: -> 47.234.101.60:2727
19:02:35 MGCP.STACK MSG TX: ntfy 58 aaln/1@65.162.109.238 MGCP 1.0
                            K: 57
                            X: 22410
                            O: l/hd

19:02:35 MGCP.STACK MSG RX: <- 47.234.101.60:2727
19:02:35 MGCP.STACK MSG RX: 200 58 OK

19:02:35 MGCP.STACK MSG RX: <- 47.234.101.60:2727
19:02:35 MGCP.STACK MSG RX: RQNT 30081 aaln/1@65.162.109.238 MGCP 1.0
                            X: 22414
                            S:
                            R: L/hu(N)
                            Q: loop
```

debug network-forensics ip dhcp

Use the **debug network-forensics ip dhcp** command to display Dynamic Host Configuration Protocol (DHCP) information collected from messages sent between clients connected to the network and the network server. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Debug messages can be activated for all clients or for specific clients connected to the network. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug network-forensics ip dhcp
debug network-forensics ip dhcp hostname <*hostname*>
debug network-forensics ip dhcp interface gigabit-switchport <*slot/port*>
debug network-forensics ip dhcp interface switchport <*slot/port*>
debug network-forensics ip dhcp interface xgigabit-switchport <*slot/port*>
debug network-forensics ip dhcp ip <*ip address*>
debug network-forensics ip dhcp mac <*mac address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

hostname <*hostname*>	Optional. Activates debug messages for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Activates debug messages for the client using the specified gigabit switchport interface.
interface switchport <*slot/port*>	Optional. Activates debug messages for the client using the specified switchport interface.
interface xgigabit-switchport <*slot/port*>	Optional. Activates debug messages for the client using the specified 10 gigabit switchport interface.
ip <*ip address*>	Optional. Activates debug messages for the client with the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
mac <*mac address*>	Optional. Activates debug messages for the client with the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.
Release R10.7.0	Command was expanded to include the switchport and 10 gigabit switchport interfaces.

Usage Examples

The following is sample output of the **debug network-forensics ip dhcp** command:

>**enable**
#debug network-forensics ip dhcp
2009.08.31 14:30:30 NETWORK_FORENSICS.IP.DHCP.giga-swx 0/5 Discover from 00:E0:29:0E:D5:E3 (xpsp3-host)
2009.08.31 14:30:31 NETWORK_FORENSICS.IP.DHCP.giga-swx 0/24 Offer from 00:E0:29:0E:D5:E5/10.23.220.254 to 00:E0:29:0E:D5:E3 of 10.23.220.1/255.255.255.0(xpsp3-host)
2009.08.31 14:30:31 NETWORK_FORENSICS.IP.DHCP.giga-swx 0/5 Request from 00:E0:29:0E:D5:E3 10.23.220.1/255.255.255.0 (xpsp3-host) to 00:E0:29:0E:D5:E5/10.23.220.254
2009.08.31 14:30:31 NETWORK_FORENSICS.IP.DHCP.giga-swx 0/24 Ack from 00:E0:29:0E:D5:E5/10.23.220.254 to 00:E0:29:0E:D5:E3 of 10.23.220.1/255.255.255.0 (xpsp3-host)

debug network-sync

Use the **debug network-sync** command to enable debug messaging for network synchronization (Network Sync). Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug network-sync clock
debug network-sync clock defects
debug network-sync clock status
debug network-sync ssm
debug network-sync ssm rx
debug network-sync ssm tx
debug network-sync ssm events
debug network-sync ssm events rx
debug network-sync ssm events tx

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

clock	Specifies Network Sync clock debug messages are enabled.
defects	Optional. Specifies that debug messages for Network Sync clock defect events are enabled.
status	Optional. Specifies that debug messages for Network Sync clock status events are enabled.
ssm	Specifies that debug messages for Network Sync synchronization status messages (SSMs) are enabled.
events	Optional. Specifies that debug message for SSM events are enabled.
rx	Optional. Specifies that debug messages for received SSM events are enabled.
tx	Optional. Specifies that debug messages for transmitted SSM events are enabled.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example enables debug messages for Network Sync clock events:

>**enable**
#debug network-sync clock

The following example enables debug messages for Network Sync SSM events:

>**enable**
#debug network-sync ssm events

debug nslookup

Use the **debug nslookup** command to activate debug messages associated with name server lookup client (nslookup) events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R13.3.0	Command was introduced.

Usage Examples

The following example activates debug messages associated with nslookup events:

```
>enable
#debug nslookup
```

debug ntp

Use the **debug ntp** command to activate debug messages associated with the Network Time Protocol (NTP) daemon information. Adding the virtual routing and forwarding (VRF) name to this command displays debug information only for the named VRF. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug ntp
debug ntp any-vrf
debug ntp vrf <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

any-vrf	Optional. Displays debug information for all VRF instances, including the default.
vrf <*name*>	Optional. Displays debug information for the specified VRF instance.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.2	Command was introduced.
Release R10.7.0	Command was expanded to include the **vrf** and **any-vrf** parameters.

Usage Examples

The following example activates debug messages associated with NTP:

>enable
#debug ntp

debug ospfv3

Use the **debug ospfv3** command to activate debug messages associated with Open Shortest Path First version 3 (OSPFv3). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ospfv3
debug ospfv3 adj
debug ospfv3 adj errors
debug ospfv3 database-timer
debug ospfv3 events
debug ospfv3 flood
debug ospfv3 flood errors
debug ospfv3 hello
debug ospfv3 hello errors
debug ospfv3 lsa-generation
debug ospfv3 packet errors
debug ospfv3 packet rx
debug ospfv3 packet rx summary
debug ospfv3 packet tx
debug ospfv3 packet tx summary
debug ospfv3 retransmission
debug ospfv3 spf
debug ospfv3 spf router-calculation
debug ospfv3 <*process id*>
debug ospfv3 <*process id*> **adj**
debug ospfv3 <*process id*> **adj errors**
debug ospfv3 <*process id*> **database-timer**
debug ospfv3 <*process id*> **events**
debug ospfv3 <*process id*> **flood**
debug ospfv3 <*process id*> **flood errors**
debug ospfv3 <*process id*> **hello**
debug ospfv3 <*process id*> **hello errors**
debug ospfv3 <*process id*> **lsa-generation**
debug ospfv3 <*process id*> **packet errors**
debug ospfv3 <*process id*> **packet rx**
debug ospfv3 <*process id*> **packet rx summary**
debug ospfv3 <*process id*> **packet tx**
debug ospfv3 <*process id*> **packet tx summary**
debug ospfv3 <*process id*> **retransmission**
debug ospfv3 <*process id*> **spf**
debug ospfv3 <*process id*> **spf router-calculation**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<process id>	Optional. Displays debug information for the specified OSPFv3 routing process. If no process ID is specified, information for all OSPFv3 processes is displayed. Valid process ID range is **1** to **65535**.
adj	Specifies that only OSPFv3 adjacency events are displayed.
database-timer	Specifies that only OSPFv3 database timer information is displayed.
events	Specifies that only OSPFv3 events are displayed.
errors	Optional. Specifies that errors about specific information are displayed.
flood	Specifies that only OSPFv3 flooding information is displayed.
hello	Specifies that only OSPFv3 Hello events are displayed.
lsa-generation	Specifies that only OSPFv3 link state advertisement (LSA) generation information is displayed.
packet errors	Specifies that only OSPFv3 errors with received packets are displayed.
packet rx	Specifies that only OSPFv3 received packet information is displayed.
packet tx	Specifies that only OSPFv3 transmitted packet information is displayed.
summary	Optional. Summarizes OSPFv3 packet information.
retransmission	Specifies that only OSPFv3 retransmission events are displayed.
spf	Specifies that OSPFv3 shortest path first (SPF) events are displayed.
spf route-calculation	Specifies that OSPFv3 SPF route calculations are displayed.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example activates the debug messages for all OSPFv3 processes on the AOS device:

```
>enable
#debug ospfv3
Receiving OSPFv3 packet from 2001:db8:10:24::106.4 to FF02::5 on eth 0/1.6
    SysUpTime=1222577915 ms.
    Hello Packet from Router ID: 1.1.1.4; Ver:2 Length:48
    Area ID: 0.0.0.0 Checksum: )x8659;; Using Null Authentication: 0:0
    PrefixLenV4: /64; Hello Interval: 10 Options: 0x13 Router Priority: 1 Router Dead Interval: 40
    Designated Router: 10.24.106.4 Backup Designated Router: 10.24.106.5
    1 Neighbors:
        123.1.1.1
16:35:24: OSPFv3: HELLO received form 1.1.1.4, neighbor state is FULL
```

debug over-temperature protection

Use the **debug over-temperature protection** command to activate debug messages associated with over-temperature protection events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug over-temperature protection
debug over-temperature protection sensor
debug over-temperature protection voting

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

sensor	Optional. Displays debug messages only for the over-temperature protection temperature sensor.
voting	Optional. Displays debug messages only for the over-temperature protection temperature voting events.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.6.0	Command was introduced.

Usage Examples

The following example activates debug messages for the over-temperature protection feature:

>enable
#debug over-temperature protection

debug packet-capture

Use the **debug packet-capture** command to enable debug messaging for all packet-capture activities. Use the **no** form of this command to disable packet-capture debug messaging.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example enables debug messaging for all packet-capture activities:

```
>enable
#debug packet-capture
```

debug ping twamp

Use the **debug ping twamp** command to activate debug messages associated with Two-Way Active Measurement Protocol (TWAMP) ping activity. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ping twamp
debug ping twamp control
debug ping twamp control events
debug ping twamp control packets
debug ping twamp test
debug ping twamp test events
debug ping twamp test packets

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

control		Optional. Activates TWAMP control debug messages.
	events	Optional. Displays TWAMP control events and messages.
	packets	Optional. Displays TWAMP control events and packets.
test		Activates TWAMP Test debug messages.
	events	Optional. Displays TWAMP test events and messages.
	packets	Optional. Displays TWAMP test events and packets.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.6	Command was introduced.

Usage Examples

The following example enables debug messaging for TWAMP control events and messages:

>enable
#debug ping twamp control
Type CTRL+C to abort. Test will complete in approximately 7 seconds.

```

debug port-auth

Use the **debug port-auth** command to generate debug messages used to aid in troubleshooting problems during the port authentication process. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug port-auth
debug port-auth auth-sm
debug port-auth bkend-sm
debug port-auth general
debug port-auth packet
debug port-auth packet [both | tx | rx]
debug port-auth reauth-sm
debug port-auth supp-sm
debug port-auth voice

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

auth-sm	Optional. Displays AuthPAE-state machine information.
bkend-sm	Optional. Displays backend-state machine information.
general	Optional. Displays configuration changes to the port authentication system.
packet both	Optional. Displays packet exchange information in both receive and transmit directions.
packet rx	Optional. Displays packet exchange information in the receive-only direction.
packet tx	Optional. Displays packet exchange information in the transmit-only direction.
reauth-sm	Optional. Displays reauthentication-state machine information.
supp-sm	Optional. Displays supplicant-state machine information.
voice	Optional. Displays voice-based port authentication information.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.1	Command was introduced.
Release 10.1	New options were introduced.
Release 13.1	New options were introduced.
Release R11.13.0	Command was expanded to include the **voice** parameter.

Usage Examples

The following example activates port authentication debug information on received packets:

>**enable**
#debug port-auth packet rx
Rcvd EAPOL Start for sess 1 on int eth 0/2

debug port security

Use the **debug port security** command to display messages associated with port security. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates port security debug messages:

```
>enable
#debug port security
```

debug ppp

Use the **debug ppp** command to activate debug messages associated with Point-to-Point Protocol (PPP) operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ppp authentication
debug ppp errors
debug ppp negotiation
debug ppp verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

authentication	Activates debug messages pertaining to PPP authentication (Challenge-Handshake Authentication Protocol (CHAP), Password Authentication Protocol (PAP), Extensible Authentication Protocol (EAP), etc.).
errors	Activates debug messages that indicate a PPP error was detected (mismatch in negotiation authentication, etc.).
negotiation	Activates debug messages associated with PPP negotiation.
verbose	Activates detailed debug messages for PPP operation.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 1.1	Command was introduced.

Functional Notes

The **debug ppp** command activates debug messages to provide information on PPP activity in the system. PPP debug messages can be used to aid in troubleshooting PPP links.

Usage Examples

The following example activates debug messages associated with PPP authentication activity:

>enable
#debug ppp authentication

debug pppoe client

Use the **debug pppoe client** command to activate debug messages associated with Point-to-Point Protocol over Ethernet (PPPoE) operation in AOS. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 6.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with PPPoE activity:

```
>enable
#debug pppoe client
```

debug probe

Use the **debug probe** command to activate debug messages associated with activities performed by the named probe object. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug probe
debug probe <*name*>
debug probe <*name*> **twamp**
debug probe <*name*> **twamp control**
debug probe <*name*> **twamp control events**
debug probe <*name*> **twamp control packets**
debug probe <*name*> **twamp test**
debug probe <*name*> **twamp test events**
debug probe <*name*> **twamp test packets**

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*name*>	Optional. Specifies the probe object or activates the probe database debug event messages for the specified probe.
twamp	Optional. Specifies Two-Way Active Measurement Protocol (TWAMP) probe verbose output.
control	Activates TWAMP control probe verbose messages.
events	Optional. Activates TWAMP control probe events.
packets	Optional. Activates decode TWAMP control packets messages.
test	Activates TWAMP Test probe verbose output.
events	Optional. Activates TWAMP Test probe events.
packets	Optional. Activates decode TWAMP Test packets messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.
Release 17.3	Command was expanded to include the TWAMP probe verbose output.

Usage Examples

The following example activates all debug messages associated with the probes:

>**enable**
#debug probe

The following example activates debug messages associated with the probe object named **probe_A**:

>**enable**
#debug probe probe_A

debug probe responder

Use the **debug probe responder** command to display probe responder event messages or activate debug messages associated with activities performed by the named probe object. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug probe responder twamp
debug probe responder twamp control
debug probe responder twamp control event
debug probe responder twamp control event <*address*>
debug probe responder twamp control packet
debug probe responder twamp control packet <*address*>
debug probe responder twamp test
debug probe responder twamp test event
debug probe responder twamp test event <*address*>
debug probe responder twamp test packet
debug probe responder twamp test packet <*address*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

twamp	Optional. Activates probe debug messages for all Two-Way Active Measurement Protocol (TWAMP) responder verbose output.
control	Optional. Activates probe debug messages for TWAMP control responder verbose output.
event <*address*>	Optional. Activates probe debug messages for TWAMP control responder events. Specify the far-end IP address to activate remote events.
packet <*address*>	Optional. Activates probe debug messages to decode TWAMP control packets. Enter an IP address to decode TWAMP control packets from a specific address.
test	Optional. Activates probe debug messages for TWAMP test responder verbose output.
event <*address*>	Optional. Activates probe debug messages for TWAMP test responder events. Enter a far-end IP address to display events from the specified address.
packet <*address*>	Optional. Activates probe debug messages to decode TWAMP test packets. Enter an IP address to decode TWAMP test packets from a specific address.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 13.1	Command was introduced.
Release 17.2	Command was expanded to include the TWAMP responder debug options.

Usage Examples

The following example activates debug messages associated with all probe objects:

>**enable**
#debug probe

The following example activates debug messages associated with the probe object named **probe_A**:

>**enable**
#debug probe probe_A

The following example activates probe responder debug messages:

>**enable**
#debug probe responder

debug radius

Use the **debug radius** command to enable debug messages from the remote authentication dial-in user service (RADIUS) subsystem. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 5.1	Command was introduced.

Functional Notes

The **debug radius** messages show the communication process with the remote RADIUS servers.

Usage Examples

The following is sample output for the **debug radius** command:

```
>enable
#debug radius
RADIUS AUTHENTICATION: Sending packet to 172.22.48.1 (1645).
RADIUS AUTHENTICATION: Received response from 172.22.48.1.
```

debug restore

Use the **debug restore** command to restore the last saved debug filters to the unit.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.

Functional Notes

This command is used to restore filters saved using the command *debug save on page 450*. To view the saved filters without restoring them to the unit, use the **show debugging saved-filters** command (refer to *show debugging on page 594*).

Usage Examples

The following example restores previously saved debug filters on the AOS unit:

```
>enable
#debug restore
Restoring saved debug filters...
Filters to restore:
debug mail-client agent
debug probe test1
Running restoration script...done
```

debug rtp media

Use the **debug rtp media** command to display media event debug messages (real time) to the terminal (or Telnet) screen. Debug messages are generated for media functions, such as the beginning and ending of anchoring sessions and the creation and destruction of associations. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.8.0	Command was introduced.

Usage Examples

The following example activates RTP packets debug messages for media events:

>enable
#debug rtp media

debug rtp quality-monitoring

Use the **debug rtp quality-monitoring** command to display voice quality monitoring (VQM) event debug messages (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug rtp quality-monitoring
debug rtp quality-monitoring packets
debug rtp quality-monitoring packets rtcp
debug rtp quality-monitoring packets rtp
debug rtp quality-monitoring packets round-trip-delay

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

packets	Optional. Displays VQM debug events of voice traffic packets.
rtcp	Optional. Displays VQM debug messages for Realtime Transport Control Protocol (RTCP) packet events.
rtp	Optional. Displays VQM debug messages for Realtime Transport Protocol (RTP) packet events.
round-trip-delay	Optional. Displays VQM debug messages for round-trip delay mechanism events.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.1	Command was introduced.
Release A1	Command was included in the AOS voice products.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following example activates RTP packets debug messages for VQM:

```
>enable
#debug rtp quality-monitoring packets rtp
2007.10.23 17:35:06 VQM.PACKET RTCP   Sender SSRC=1244609021
2007.10.23 17:35:06 VQM.PACKET RTCP   NTP timestamp (MSW)=3402167683 (0xcac8f583)
2007.10.23 17:35:06 VQM.PACKET RTCP   NTP timestamp (LSW)=1116355952 (0x428a3d70)
2007.10.23 17:35:06 VQM.PACKET RTCP   RTP timestamp=3990799999
2007.10.23 17:35:06 VQM.PACKET RTCP   SSRC=1919245558
```

```
2007.10.23 17:35:06 VQM.PACKET RTCP   Last SR timestamp=4119950126 (0xf591732e)
2007.10.23 17:35:06 VQM.PACKET RTCP   Delay since last SR timestamp=175671
2007.10.23 17:35:06 VQM.PACKET RTCP   handle=0x6179810ebu
2007.10.23 17:35:09 VQM.PACKET RTCP Rx RTCP SR pkt from 10.22.41.91
2007.10.23 17:35:09 VQM.PACKET RTCP   call-ID=30bbb408417e519a00be27ac15d5776b@1
    0.22.41.52
2007.10.23 17:35:09 VQM.PACKET RTCP   Sender SSRC=1919245558
2007.10.23 17:35:09 VQM.PACKET RTCP   NTP timestamp (MSW)=3402167702 (0xcac8f596)
2007.10.23 17:35:09 VQM.PACKET RTCP   NTP timestamp (LSW)=1932399624 (0x732e1408)
2007.10.23 17:35:09 VQM.PACKET RTCP   RTP timestamp=2621875150
2007.10.23 17:35:09 VQM.PACKET RTCP   SSRC=1244609021
2007.10.23 17:35:09 VQM.PACKET RTCP   Last SR timestamp=4119020170 (0xf583428a)
2007.10.23 17:35:09 VQM.PACKET RTCP   Delay since last SR timestamp=151436
2007.10.23 17:35:09 VQM.PACKET RTCP   handle=0x6524010g all
```

debug rtp quality-monitoring reporter

Use the **debug rtp quality-monitoring reporter** to activate debug messages associated with voice quality monitoring (VQM) reporters. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug rtp quality-monitoring reporter
debug rtp quality-monitoring reporter <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*name*>	Optional. Specifies that debug messages are enabled only for the named reporter.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.6	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following is sample output of debug messages for VQM reporter **Reporter1**:

>enable
#debug rtp quality-monitoring reporter Reporter1
08:46:13 VQM.REPORTER Reporter1 1 Enqueuing VQM Report - 2575556352@10.1.3.9 to 6353@10.1.3.9, RTP=10.10.20.2:2234->10.17.138.1:3000
08:46:13 VQM.REPORTER Reporter1 1 Generating VQM Report
08:46:13 VQM.REPORTER Reporter1 1 Sending VQM Report
08:46:13 VQM.REPORTER Reporter1 1 Transaction 0x022ad5f0: state changed -> Client General Request Sent

debug save

Use the **debug save** command to perform a persistent save of the debug filters enabled in the current command line interface (CLI) session. The saved filters can be restored at a later time.

> NOTE *Turning on a large amount of debug information can adversely affect the performance of your unit.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.

Functional Notes

This command is used to save debug filters across a unit reboot. Filters are restored using the command *debug restore on page 445*. To view the saved filters without restoring them to the unit, use the **show debugging saved-filters** command (refer to *show debugging on page 594*).

Only one set of filters can be saved per instance of AOS. If a previous set of filters has been saved, issuing the **debug save** command overwrites the previously saved filters with the current set of filters. If no filters are currently active, issuing **debug save** has no effect so that the last saved files are not lost.

Usage Examples

The following example saves the debug filters from the current CLI session:

```
>enable
#debug save
Saving debug filters enabled in this session...
debug mail-client agent
debug probe test1
Done.
```

debug schedule

Use the **debug schedule** command to activate debug messages associated with a schedule. Variations of this command include:

debug schedule
debug schedule <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*name*>	Optional. Displays only the debug information for a specific schedule.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following example enables debug information for any configured schedules:

>**enable**
#debug schedule
01:00:15: NETMON.SCHEDULE MIDNIGHT: status changed to inactive

debug sip

Use the **debug sip** command to activate debug messages associated with Session Initiation Protocol (SIP) events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug sip cldu
debug sip location
debug sip manager
debug sip name-service
debug sip secure remote-user
debug sip syntax
debug sip tdu
debug sip trunk-registration
debug sip trunk-registration <*Txx*>
debug sip trunk-registration <*Txx*> <*trunk id*>
debug sip user-registration
debug sip user-registration <*extension*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

cldu	Activates SIP call leg distribution unit (CLDU) event debug messages.
location	Activates SIP location database event debug messages.
manager	Activates SIP stack manager event debug messages.
name-service	Activates SIP name-service event debug messages.
secure remote-user	Activates SIP security remote user debug messages.
syntax	Activates SIP syntax event debug messages.
tdu	Activates SIP transaction distribution unit (TDU) debug messages.
trunk-registration	Activates all SIP trunk-registration event debug messages.
trunk-registration <*Txx*>	Optional. Activates SIP trunk-registration event debug messages for a specific trunk. For example: Txx (T01) where xx is the trunk's two-digit identifier.
trunk-registration <*Txx*> <*trunk id*>	Optional. Activates SIP trunk-registration event debug messages for a specific trunk. For example: Txx (T01) where xx is the trunk's two-digit identifier and <trunk id> is the specific name associated with the trunk.
user-registration	Activates all SIP user-registration event debug messages.
user-registration <*extension*>	Optional. Activates SIP user-registration event debug messages for a specific trunk.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.3	Command was introduced.
Release 11.1	Command was expanded to include the proxy event messages.
Release 15.1	Command was expanded to include the name-service messages.
Release 16.1	Command was expanded to include the TDU messages.
Release 17.3	Command was expanded to include the syntax messages.
Release R10.7.0	Command was expanded to include the **secure remote-user** parameter.

Usage Examples

The following example activates all debug messages associated with SIP CLDU events:

```
>enable
#debug sip cldu
```

debug sip connections

Use the **debug sip connections** command to activate debug messages associated with setting up and tearing down a Session Initiation Protocol (SIP) connection to remote peer. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug sip connections
debug sip connections persistence

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

persistence	Activates SIP connection debug messages only for persistent connections.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example activates all debug messages associated with SIP connection events:

>enable
#debug sip connections

debug sip proxy

Use the **debug sip proxy** command to activate debug messages associated with Session Initiation Protocol (SIP) proxy events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug sip proxy database
debug sip proxy database verbose
debug sip proxy dialogs
debug sip proxy register rate-adaption
debug sip proxy routing
debug sip proxy transactions
debug sip proxy verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

database	Activates SIP proxy database debug event debug messages.
verbose	Activates more detailed debug messages concerning SIP proxy user database lookups.
dialogs	Activates SIP proxy DOM event debug messages.
register rate-adaption	Activates SIP proxy REGISTER rate adaption debug messages.
routing	Activates SIP proxy message-routing events.
transactions	Activates SIP proxy event debug messages that shows the interaction between the SIP proxy and the SIP stack.
verbose	Activates all SIP proxy debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.
Release A5.02	Command was expanded to include the **register rate-adaption** parameter.
Release R11.10.5	Command was expanded to include the **verbose** option for **debug sip proxy database**.

Usage Examples

The following example activates all debug messages associated with SIP proxy events:

>**enable**
#debug sip proxy verbose

debug sip stack

Use the **debug sip stack** command to activate debug messages associated with Session Initiation Protocol (SIP) stack events. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug sip stack debug
debug sip stack errors
debug sip stack exceptions
debug sip stack info
debug sip stack messages [**ack** | **all** | **bye** | **cancel** | **info** | **invite** | **message** | **notify** | **options** | **prack** | **publish | refer | register | request | response | subscribe | update] [from** <*user*> | **request** | **response** | **rx** | **to** <*user*> | **tx**]
debug sip stack messages [**from** <*user*> | **request** | **response** | **rx** | **to** <*user*> | **tx**]
debug sip stack messages summary [**ack** | **all** | **bye** | **cancel** | **info** | **invite** | **message** | **notify** | **options** | **prack** | **publish** | **refer** | **register** | **request** | **response** | **subscribe** | **update**] [**from** <*user*> | **request** | **response** | **rx** | **to** <*user*> | **tx**]
debug sip stack verbose
debug sip stack warnings

Turning on a large amount of debug information can adversely affect the performance of your unit.

*The majority of the **debug sip stack messages** variations are available in any order, at any time within the subcommand. Use the **?** at any level after each variation listed within the brackets to view additional arguments and variations for the subcommand(s).*

Syntax Description

debug	Activates SIP stack debug event debug messages.
errors	Activates SIP stack error event debug messages.
exceptions	Activates SIP stack exception event debug messages.
info	Activates SIP stack info event debug messages.
messages	Specify which SIP debug messages to activate from the list below.
ack	Activates SIP ACK debug messages.
all	Activates all SIP debug messages.
bye	Activates SIP BYE debug messages.
cancel	Activates SIP CANCEL debug messages.
from <*user*>	Activates SIP debug messages from the specified user.
info	Activates SIP INFO debug messages.
invite	Activates SIP INVITE debug messages.
message	Activates SIP MESSAGES debug messages.

notify	Activates SIP NOTIFY debug messages.
options	Activates SIP OPTIONS debug messages.
prack	Activates SIP PRACK debug messages.
publish	Activates SIP PUBLISH debug messages.
refer	Activates SIP REFER debug messages.
register	Activates SIP REGISTER debug messages.
request	Activates the specified SIP request debug messages.
response	Activates the specified SIP response debug messages.
rx	Activates received SIP debug messages **to** or **from** a specific user.
subscribe	Activates SIP SUBSCRIBE debug messages.
summary	Activates SIP debug messages and displays only a summary (first line) of the available messages.
to <*user*>	Activates SIP debug messages to the specified user.
tx	Activates transmitted SIP debug messages **to** or **from** a specific user.
update	Activates SIP UPDATE debug messages.
verbose	Activates all SIP stack event debug messages.
warnings	Activates SIP stack warning event debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.3	Command was introduced.
Release A1	Command was expanded in the AOS voice products.

Usage Examples

The following example activates all debug messages associated with SIP stack events:

```
>enable
#debug sip stack all
```

debug snmp packets

Use the **debug snmp packets** command to enable debug output from local Simple Network Management Protocol (SNMP) traffic. Debug messages are displayed (real time) to the terminal (or Telnet) screen. When SNMP packets ingress or egress the unit (local traffic only), the traffic is displayed in a partially decoded form. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 14.1	Command was introduced.

Usage Examples

The following is an example of debug output for snmp packets:

```
>enable
#debug snmp packets
#SNMP V1 RX: GET-NEXT Request PDU from 10.23.1.157:2922 (community=public)
 request id=3, error status=0, error index=0
 max repetitions=0, non repetitions=0
 VarBinds:
   OID=1.3.6.1.2.1.1.3
   value=empty

#SNMP V1 TX: GET Response PDU to 10.23.1.157:2922 (community=public)
 request id=3, error status=0, error index=0
 max repetitions=1, non repetitions=0
 VarBinds:
   OID=1.3.6.1.2.1.1.3.0
   value=410825
```

debug sntp

Use the **debug sntp** command to enable debug messages associated with the Simple Network Time Protocol (SNTP). All SNTP packet exchanges and time decisions are displayed with these debugging events enabled. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug sntp client
debug sntp server

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

client	Displays SNTP client information.
server	Displays SNTP server information.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.
Release 13.1	Command was expanded to include the client and server options.

Functional Notes

The **debug sntp** command activates debug messages to aid in troubleshooting SNTP issues.

Usage Examples

The following is sample output for the **debug sntp client** command:

>enable
#debug sntp client
#configure terminal
#sntp server ntp.adtran.com
2009.03.16 15:38:06 SNTP.CLIENT sent Version 1 SNTP time request to 172.22.48.13
2009.03.16 15:38:06 SNTP.CLIENT received SNTP reply packet from 172.22.48.13
2009.03.16 15:38:06 SNTP.CLIENT setting time to 03-16-2009 15:37:54 CDT
2009.03.16 15:37:54 SNTP.CLIENT waiting for 86400 seconds for the next poll interval

debug spanning-tree

Use the **debug spanning-tree** command to enable the display of spanning-tree debug messages. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug spanning-tree config
debug spanning-tree events
debug spanning-tree general
debug spanning-tree topology

Turning on a large amount of debug information can adversely affect the performance of your unit.

Refer to debug spanning-tree bpdu on page 462 for more information.

Syntax Description

config	Enables the display of spanning-tree debug messages when configuration changes occur.
events	Enables the display of debug messages when spanning-tree protocol events occur.
general	Enables the display of general spanning-tree debug messages.
topology	Enables the display of debug messages when spanning-tree protocol topology events occur.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 5.1	Command was introduced.
Release 12.1	Command was expanded to include **topology**.

Usage Examples

The following example enables the display of general spanning-tree debug messages:

```
>enable
#debug spanning-tree general
```

debug spanning-tree bpdu

Use the **debug spanning-tree bpdu** command to display bridge protocol data unit (BPDU) debug messages. When enabled, a debug message is displayed for each BPDU packet that is transmitted or received by the unit. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug spanning-tree bpdu all
debug spanning-tree bpdu receive
debug spanning-tree bpdu transmit

Turning on a large amount of debug information can adversely affect the performance of your unit.

Refer to debug spanning-tree on page 461 for more information.

Syntax Description

all	Displays debug messages for BPDU packets that are transmitted and received by the unit.
receive	Displays debug messages for BPDU packets received by the unit.
transmit	Displays debug messages for BPDU packets transmitted by the unit.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example displays debug messages for BPDU packets that are transmitted and received by the unit:

```
>enable
#debug spanning-tree bpdu all
```

debug ssh

Use the **debug ssh** command to activate debug messages associated with secure shell (SSH) client and server information. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug ssh client events
debug ssh client port-forward
debug ssh client scp
debug ssh client sftp
debug ssh server events

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

client events	Enables the display of SSH client events.
client port-forward	Enables the display of SSH port forward information.
client scp	Enables the display of SSH client SCP information.
client sftp	Enables the display of SSH client SFTP information.
server events	Enables the display of SSH and SCP server events.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.10.0	Command was introduced.
Release R11.4.0	Command was expanded to include the **client port-forward** parameter.
Release R13.11.0	Command was expanded to include the **client sftp** parameter.

Usage Examples

The following enables the display of SSH server event debug messages:

>enable
#debug ssh server events

debug stack

Use the **debug stack** command to enable switch-stacking debug messages. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.Variations of this command include:

debug stack
debug stack switch
debug stack verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

switch	Optional. Enables messages specific to the stack ports (stack switch application program interface (API) information).
verbose	Optional. Enables detailed messages specific to the stack protocol.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example activates the possible debug stack messages:

>enable
#debug stack switch
#debug stack verbose

debug system

Use the **debug system** command to enable debug messages associated with system events (i.e., login, logouts, etc.). Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with system information:

```
>enable
#debug system
```

debug tacacs+

Use the **debug tacacs+** command to activate debug messages associated with terminal access controller access-control system plus (TACACS+) protocol. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug tacacs+
debug tacacs+ events
debug tacacs+ packets

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Optional. Activates TACACS+ event debug messages.
packets	Optional. Activates TACACS+ packet debug messages.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with the TACACS+ protocol:

```
>enable
#debug tacacs+ packets
```

debug tcl

Use the **debug tcl** command to activate debug messages associated with tool command language (Tcl) interpreter operation. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug tcl cli
debug tcl cli <*filename*>
debug tcl track <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

cli	Displays debug messages for the Tcl interpreter to the command line interface (CLI).
<*filename*>	Optional. Displays debug messages only for the specified Tcl script file.
track <*name*>	Displays debug messages for the specified track. The **track** parameter is only available on platforms with Network Monitoring enabled.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example activates debug messages for the Tcl interpreter while running the file **test1.tcl**:

>**enable**
#debug tcl test1.tcl

debug tls sip

Use the **debug tls sip** command to enable debug messages for Session Initiation Protocol (SIP) Transport Layer Security (TLS) functionality. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug tls sip events
debug tls sip negotiation

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

events	Displays TLS events, such as errors and state changes.
negotiation	Displays information about each step of all TLS handshakes.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example enables debug messages for all SIP TLS events:

```
>enable
#debug tls sip
```

debug track

Use the **debug track** command to activate debug messages associated with activities performed by track objects. Debug messages are displayed (real time) to the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include:

debug track
debug track <*name*>

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

<*name*>	Optional. Displays information about the specified track rather than all configured tracks.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 13.1	Command was introduced.

Usage Examples

The following example activates debug messages associated with all track objects:

>enable
#debug track

The following example activates debug messages associated with the track object named **track_1**:

>enable
#debug track track_1

debug voice

Use the **debug voice** command to activate debug messages associated with voice functionality. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug voice account-status
debug voice conference local
debug voice dsp
debug voice dsp voip <*slot/port*> **channel** <*number*> **ecan**
debug voice dsp voip <*slot/port*> **channel** <*number*> **rfc2833**
debug voice dsp voip <*slot/port*> **channel** <*number*> **rtp**
debug voice dsp voip <*slot/port*> **channel verbose rfc2833**
debug voice dsp voip <*slot/port*> **channel verbose rtp**
debug voice erltool
debug voice erltool info
debug voice erltool statemachine
debug voice lineaccount
debug voice lineaccount <*line*>
debug voice linemanager
debug voice linemanager <*line*>
debug voice loopback
debug voice phonemanager
debug voice phonemanager <*slot:port*>
debug voice ring-group
debug voice ring-group <*group*>
debug voice rtp channel
debug voice rtp conference local
debug voice rtp manager
debug voice rtp provider
debug voice rtp verbose
debug voice smdr
debug voice smdr <*number*>
debug voice srtp
debug voice srtp sdes
debug voice srtp sdes events
debug voice srtp sdes negotiation
debug voice srtp sdes parse
debug voice stationaccount
debug voice stationaccount <*extension*>
debug voice summary
debug voice switchboard
debug voice switchboard <*subsource*>
debug voice switchboard call
debug voice switchboard call <*call id*>
debug voice switchboard ccm

debug voice toneservices
debug voice toneservices *<notifies>*
debug voice toneservices *<interface>*
debug voice toneservices *<interface> <slot/port>*
debug voice trunkaccount
debug voice trunkaccount *<trunk id>*
debug voice trunkaccount *<trunk id> <appearance>*
debug voice trunkmanager
debug voice trunkmanager *<trunk id>*
debug voice trunkmanager *<trunk id> <appearance>*
debug voice trunkport
debug voice trunkport *<slot:port:DS0>*
debug voice verbose

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

account-status	Activates station account status event debug messages.
dsp	Activates digital signal processor (DSP) event debug messages.
voip *<slot/port>* **channel**	Optional. Activates DSP on the specified interface and DSP channel.
<number>	Optional. Activates DSP on the specified interface and DSP channel.
ecan	Optional. Activates the echo canceller debug feature.
rfc2833	Optional. Activates the RFC 2833 debug feature.
rtp	Optional. Activates Realtime Transfer Protocol (RTP) event debug messages for the specified interface and channel.
verbose	Optional. Activates detailed debug DSP messaging for the RTP and RFC 2833 features.
erltool	Activates the echo return loss (ERL) debug messages to monitor the progress of the testing.
info	Optional. Activates information events related to the ERL tool testing progress.
statemachine	Optional. Activates ERL tool state machine events.
lineaccount	*Activates all line account event debug messages.*
<line>	Optional. *Activates a specific line account event debug messages.*
linemanager	*Activates all line manager event debug messages.*
<line>	Optional. *Activates a specific line manager event debug messages.*
loopback	*Activates all voice loopback account event debug messages.*
phonemanager	Activates all phone manager event debug messages.
<slot:port>	Optional. Activates phone manager event debug messages for a specific slot and port.

ring-group	Activates ring-group event debug messages.
<group>	Optional. Activates event debug messages for a specified group.
rtp	Activates Realtime Transport Protocol (RTP) event debug messages.
channel	Activates RTP channel event debug messages.
conference local	Activates local conference session debug messages.
manager	Activates RTP manager event debug messages.
provider	Activates RTP provider event debug messages.
verbose	Activates detailed RTP debug messages.
smdr	Activates all station message detail reporting (SMDR) event debug messages.
<number>	Optional. Activates SMDR event debug messages for a specific to or from number.
srtp	Activates debug messages for Secure Realtime Transfer Protocol (SRTP).
sdes	Optional. Activates debug messages for Session Description Protocol Security Descriptions (SDES) key management of SRTP.
events	Optional. Displays SDES events, such as errors and state changes.
negotiation	Optional. Displays information about each step of all SDES negotiations.
parse	Optional. Displays information about the parsing of SDES content.
stationaccount	Activates all station account event debug messages.
<extension>	Optional. Activates station account event debug messages for a specific extension.
summary	Activates simple voice event debug messages.
switchboard	Activates all switchboard event debug messages.
<subsource>	Optional. Activates switchboard event debug messages for a specific subsource.
call	Activates switchboard call state machine event debug messages.
call *<call id>*	Optional. Activates switchboard call state machine event debug messages for a specific call.
ccm	Activates switchboard call connection manager event debug messages.
toneservices	Activates all tone service events debug messages.
<notifies>	Optional. Activates tone service events debug messages for the specified interface type. For example, for a foreign exchange station (FXS) interface, use **fxs**.
<interface>	Optional. Activates tone service events debug messages for the specified interface type.
<interface> <slot/port>	Optional. Activates tone service events debug messages for the specified slot and port of the interface type. For example, for an individual FXS port use, **fxs 0/1**.
trunkaccount	Activates all trunk account event debug messages.
<trunk id>	Optional. Activates trunk account event debug messages for a specific trunk.

<trunk id> <appearance>	Optional. Specifies specific trunk appearance.
trunkmanager	Activates all trunk manager event debug messages.
<trunk id>	Optional. Activates trunk manager event debug messages for a specific trunk.
<trunk id> <appearance>	Optional. Specifies specific trunk appearance.
trunkport	Activates all trunk port event debug messages.
<slot:port:DS0>	Optional. Activates trunk port event debug messages for a specific slot, port, and digital signal 0 (DS0).
verbose	Optional. Displays the entire running configuration to the terminal screen (versus only the nondefault values).

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 9.3	Command was introduced.
Release 10.1	Command was expanded to include more parameters.
Release 12.1	Command was expanded to include more parameters.
Release 13.1	Command was expanded to include more parameters.
Release 14.1	Command was expanded to include more parameters.
Release 15.1	Command was expanded to include more parameters.
Release A1	Command was expanded to include the **loopback** parameter.
Release A2	Command was expanded to include the **conference local** and **dsp** parameters.
Release A2.04	Command was expanded to include the **erltool**, **paging-group**, and **replication** parameters.
Release A4.01	Command was expanded to include the **moh**, **findme-followme**, **pickup-group**, **queue**, and **conference local** parameters.
Release A4.05	Command was altered to exclude the **color** and **pickup-group** parameters. The **color** parameter is covered by the **debug color** command on *page 298* and the **pickup-group** parameter is covered using the **debug voice verbose** command. Command was expanded to include the **services-interface** and **ring-group** parameters.
Release A5.01	Command was expanded to include the **fax**, **detailed**, and **isu_cp_det** parameters.
Release R11.2.0	Command was expanded to include the **call-pickup** parameter.
Release R11.5.0	Command was expanded to include the **srtp** and **sdes** parameters.

Release R13.6.0	Command was rewritten to exclude parameters that are no longer supported (**auto-attendant**, **call-pickup**, **dsp fax**, **dsp isu_cp_det**, **findme-followme**, **mail**, **moh**, **paging-group**, **promptstudio**, **proxydial**, **queue**, **replication**, **services interface**, and **statusgroups**). In addition the **rtp** parameter was added to the **debug voice dsp voip** command, the **rtp** and **rfc2833** parameters were added to the **debug dsp voip verbose** command, the <*group*> parameter was added to the **debug voice ring-group** command, the <*appearance*> parameter was added to the **debug voice trunkmanager** command.

Usage Examples

The following example activates all debug messages associated with voice functionality:

>**enable**
#debug voice summary

debug vrrp

Use the **debug vrrp** command to enable Virtual Router Redundancy Protocol (VRRP) debug messages. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug vrrp
debug vrrp error
debug vrrp interface <*interface*> **error**
debug vrrp interface <*interface*> **group** <*number*> **error**
debug vrrp interface <*interface*> **group** <*number*> **packet**
debug vrrp interface <*interface*> **packet**
debug vrrp packet

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

error	Optional. Displays debug messages for all VRRP errors in all groups on all interfaces or on a specified interface.
interface <*interface*>	Optional. Displays debug messages for all VRRP groups on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a virtual local area network (VLAN) interface, use **vlan 1**. Type **debug vrrp interface ?** for a complete list of valid interfaces.
group <*number*>	Optional. Specifies debug messages for a single VRRP group on a specified interface are generated. Group numbers range from **1** to **255**.
error	Optional. Displays debug messages for VRRP errors for a single group on a specified interface.
packet	Optional. Displays debug messages for VRRP packets for a single group on a specified interface.
packet	Optional. Displays debug messages for all VRRP packets in all groups on all interfaces or on a specified interface.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release 16.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

Although VRRP group virtual router IDs (VRIDs) can be numbered between 1 and 255, only two VRRP routers per interface are supported.

Usage Examples

The following example gives sample output from the **debug vrrp packet** command:

>**enable**
#debug vrrp packet
2007.05.26 15:48:57 VRRP.PKT eth 0/1 grp 1 Sent Advertisement pri: 125, ipCnt:1
2007.05.26 15:48:57 VRRP.PKT eth 0/1 grp 2 Received Advertisement pri: 125 from 10.23.197.236

debug vrrpv3

Use the **debug vrrpv3** command to enable Virtual Router Redundancy Protocol version 3 (VRRPv3) debug messages. Debug messages are displayed (real time) on the terminal (or Telnet) screen. Use the **no** form of this command to disable the debug messages. Variations of this command include the following:

debug vrrpv3
debug vrrpv3 error
debug vrrpv3 interface <*interface*>
debug vrrpv3 interface <*interface*> **group** <*vrid*> **ipv4**
debug vrrpv3 interface <*interface*> **group** <*vrid*> **ipv6**
debug vrrpv3 interface <*interface*> **group** <*vrid*> **ipv4 packet**
debug vrrpv3 interface <*interface*> **group** <*vrid*> **ipv6 packet**
debug vrrpv3 interface <*interface*> **packet**
debug vrrpv3 packet

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

error	Optional. Displays debug messages for all VRRPv3 errors in all groups on all interfaces or on a specified interface.
interface <*interface*>	Optional. Displays debug messages for all VRRPv3 groups on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a virtual local area network (VLAN) interface, use **vlan 1**. Type **debug vrrpv3 interface ?** for a complete list of valid interfaces.
group <*vrid*>	Optional. Displays debug messages for a single VRRPv3 virtual router ID (VRID) on a specified interface. VRIDs range from **1** to **255**.
ipv4	Displays debug messages for the VRID's IPv4 address family.
ipv6	Displays debug messages for the VRID's IPv6 address family.
packet	Optional. Displays debug messages for VRRPv3 packets for a single group on a specified interface.
packet	Optional. Displays debug messages for all VRRPv3 packets in all groups on all interfaces or on a specified interface.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R10.7.0	Command was introduced.
Release R10.11.0	Command was expanded to include the **ipv4** and **ipv6** parameters.

Functional Notes

Although VRRPv3 group VRIDs can be numbered between 1 and 255, only two VRRPv3 routers per interface per IP version are supported.

Usage Examples

The following example enables VRRPv3 debug messaging:

>**enable**
#debug vrrpv3 packet

debug y1731 file-save

Use the **debug y1731 file-save** command to enable debug messages for the Y.1731 performance monitoring logging subsystem to display information on file writes and log rotation events. Use the **no** form of this command to disable the debug messages.

Turning on a large amount of debug information can adversely affect the performance of your unit.

Syntax Description

No subcommands.

Default Values

By default, all debug messages in AOS are disabled.

Command History

Release R11.6.0	Command was introduced.

Usage Examples

The following example enables Y.1731 performance monitoring logging debug messaging:

```
>enable
#debug y1731 file-save
```

dir

Use the **dir** command to display a directory list of all files on the system or just those matching the specified pattern, located in a specified location. Variations of this command include:

dir
dir *<pattern>*
dir cflash
dir cflash *<pattern>*
dir flash
dir flash *<pattern>*
dir ramdisk
dir ramdisk *<pattern>*
dir usbdrive0
dir usbdrive0 *<pattern>*

Syntax Description

<pattern>	Optional. Displays all files that match the specified pattern. When a wildcard (*****) is specified, only files located in the specified location matching the listed pattern are displayed. For example, ***.biz** displays all files with the .biz extension. When no wildcard is specified, the entire contents of flash memory is displayed.
cflash	Optional. Displays files located on the installed CompactFlash® card.
flash	Optional. Displays files located on the system in flash memory.
ramdisk	Optional. Displays files located on the volatile RAM disk.
usbdrive0	Optional. Displays files located on the Universal Serial Bus (USB) flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 12.1	Command was expanded to include CompactFlash.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include USB flash drive memory.

Usage Examples

The following is sample output from the **dir flash** command:

```
>enable
#dir flash
3563529 NV2100A-10-05-00-E.biz
   2438 startup-config
   2484 startup-config.bak
3694712 bytes used, 3007368 available, 6702080 total
```

The following is sample output from the **dir ramdisk** command displaying the contents of the RAM disk, space occupied by each file, the total ramdisk space allocated, available space, and used space:

```
>enable
#dir ramdisk
10005125 NV3130A-17-07-00-26-AE.biz
10007923 bytes used, 7429514 available, 17437437 total
```

disable

Use the **disable** command to exit the Enable mode and enter the Basic mode.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example exits the Enable mode and enters the Basic Command mode:

```
#disable
>
```

dot11ap apply-changes

Use the **dot11ap apply-changes** command to apply any configuration changes to a NetVanta 160 Series access point (AP). Any configuration that is performed on the AP is not completed until the configuration is applied to the AP using this command. Variations of this command include:

dot11ap apply-changes <*ap*>
dot11ap apply-changes all

Syntax Description

<*ap*>	Specifies the NetVanta 160 Series AP to which to apply the changes. Valid range is **1** to **8**.
all	Optional. Specifies the changes are applied to all managed NetVanta 160 Series APs.

Default Values

By default, no changes are applied to the NetVanta 160 AP without the use of this command.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following example specifies that all NetVanta 160 Series APs managed by the access controller are updated with recent configuration changes:

>**enable**
#dot11ap apply-changes

eject usbdrive0

Use the **eject usbdrive0** command to safely eject a specified Universal Serial Bus (USB) device before removing it from the AOS unit.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.

Usage Examples

The following example ejects an attached USB flash drive device.

```
>enable
#eject usbdrive0
```

erase

Use the **erase** command to erase the files from a specified location.

Variations of this command (valid on all AOS units) include:

erase *<filename>*
erase startup-config

Variations of this command (valid only on AOS units WITH CompactFlash®) include:

erase cflash *<filename>*
erase flash *<filename>*
erase file-system cflash

Variations of this command (valid only on AOS units WITH voice capability) include:

erase dynvoice-config
erase file-system flash
erase file-system interface mef-ethernet *<interface>*

Variations of this command (valid only on AOS units WITH **ramdisk** enabled) include:

erase ramdisk *<filename>*

Variations of this command (valid only on AOS units WITH Universal Serial Bus (USB) flash drive capability) include:

erase file-system usbdrive0
erase usbdrive0 *<filename>*

Erasing the file system removes all files and directories located in the unit's memory, including firmware images. If the primary boot image is located on the erased file system, the unit will be adversely affected after a reboot. The firmware has to be replaced using the procedure explained in the Upgrading AOS Firmware configuration guide, available online at https://supportcommunity.adtran.com.

Syntax Description

<filename>	Specifies the name of the file to erase. The asterisk (*) can be used as a wildcard to specify a pattern for erasing multiple files. When a wildcard is specified, only files matching the listed pattern are erased.
cflash	Specifies the location of the file to erase as the installed CompactFlash card.
dynvoice-config	Erases the dynamic voice configuration file stored in the flash memory.
file-system	Erases the system files stored in either the system flash, CompactFlash, or USB flash drive memory.
flash	Specifies the location of the file to erase as the system flash memory.
mef-ethernet *<interface>*	Erases the file system on the specified MEF-Ethernet interface.

ramdisk	Specifies the location of the file to erase as the volatile RAM disk.
startup-config	Erases the startup configuration file stored in flash memory.
usbdrive0	Specifies the location of the file to erase as the USB flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 12.1	Command was expanded to include the **dynvoice-config** parameter.
Release 14.1	Command was expanded to include the **file-system cflash** parameter.
Release A2.04	Command was expanded to include the **file-system flash** parameter.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release 18.2	Command was expanded to include the USB flash drive memory.

Usage Examples

The following example erases the startup configuration file stored in flash memory:

>**enable**
#erase startup-config
If a new startup configuration file is not specified before cycling the power on the unit, AOS will initialize using a blank configuration.

The following example erases all files located on the installed CompactFlash card:

>**enable**
#erase file-system cflash
This will erase ALL files on compact flash. Proceed? [y/n]

The following example erases all files located in the system flash memory:

>**enable**
#erase file-system flash
WARNING! You are about to erase all files on the flash file system.
This includes all firmware images and configuration files. This cannot be undone.

This will erase ALL files on flash. Proceed? [y/n]

events

Use the **events** command to enable event reporting to the current command line interface (CLI) session. Use the **no** form of this command to disable all event reporting to the current CLI session.

Syntax Description

No subcommands.

Default Values

By default, this command is enabled.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following example enables event reporting:

```
>enable
#events
```

exception report generate

Use the **exception report generate** command to immediately generate an exception report.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.

Usage Examples

The following example immediately generates an exception report:

```
>enable
#exception report generate
```

factory-default

Use the **factory-default** command to reset the unit to the factory default setting.

*Performing an AOS **factory-default** disrupts data traffic.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Functional Notes

After you issue this command, the system responds by first warning you that restoring the factory default settings will erase the current configurations. It then asks if you would like to proceed. Choose **n** to return to the command prompt (no configuration changes are made). Choose **y** to erase the startup-configuration, replace it with the factory-default configuration, and reboot the unit. After reboot, the new configuration takes effect.

Usage Examples

The following example resets the unit to the factory default settings:

>**enable**
#factory-default

WARNING - Restoring the factory default settings will erase the current startup and running configurations and will reboot the unit.

Restore factory default settings?[y/n]**y**

Startup configuration written.

Rebooting the system. Please wait...

find <*input*>

Use the **find** command to search the AOS CLI for a specific command. The output of this command displays the command set location of the discovered commands. Variations of this command include:

find <*input*>
find /current set <*input*>
find /current set /no suppress <*input*>
find /no suppress /current set <*input*>
find /no suppress <*input*>

Syntax Description

<*input*>	Specifies the given command for which to search in a text string; for example, **sip proxy**. Wild-card matching can be performed by entering *****; for example, **sip ***.
/current set	Optional. Limits the command search results to the current command set.
/no suppress	Optional. Specifies the search output does not suppress multiple results.

Default Values

No default values are necessary for this command.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

The **/current set** and **/no suppress** parameters of the **find** command may be entered in any order.

The use of wildcard matching can be beneficial when searching for a command for which the entire command syntax is not known (such as **sip pr**).

Usage Examples

The following example searches for the command **billing-code**:

```
>enable
#find billing-code
Searching.... Found 2 commands
voice-user          : billing-codes
configterminal      : voice spre-map billing-code
```

The following example searches for any commands with **sip pr**:

```
>enable
#find sip pr
Searching...Found 4 commands
Root                : clear sip proxy
```

```
Root                : debug sip proxy
Root (2)            : show sip proxy
configterminal      : sip proxy
```

The following example searches for any commands with **sip pr**, without suppressing the search results:

```
>enable
#find /no-suppress sip pr
Searching... Found 7 commands
Root                : clear sip proxy
Root                : debug sip proxy
Root                : show running-config sip proxy
Root                : show sip proxy
configterminal      : sip prefer
configterminal      : sip privacy
configterminal      : sip proxy
```

flashme

Use the **flashme** command to allow the ActivChassis master device to flash the LEDs on its connected linecard devices. Variations of this command include:

flashme
flashme vcid <*vcid*>
flashme vcid <*vcid*> <*value*>
flashme <*value*>

Syntax Description

vcid <*vcid*>	Optional. Specifies that only the device with the specified VCID will flash LEDs. Valid VCID range is **1** to **8** (VCID values **1** and **2** are given to the ActivChassis master and backup devices, respectively).
<*value*>	Optional. Specifies the duration (in seconds) that the LEDs will flash.

Default Values

By default, LEDs will flash for **3** seconds.

Command History

Release AC1.0	Command was introduced.

Functional Notes

This command is available from both the ActivChassis master and linecard devices' CLI. For more information about the difference between linecard and master devices, how to access the CLI for each, and additional configuration information, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example tests the master device's connection to all ActivChassis linecard devices:

>enable
#flashme

http secure-server certificate regenerate

Use the **http secure-server certificate regenerate** command to generate a new private key and certificate used by the Hypertext Transfer Protocol (HTTP) secure (HTTPS) server. When a new HTTPS certificate is generated, it erases the old HTTPS private key and certificate.

Syntax Description

No subcommands.

Default Values

By default, a unique HTTPS certificate and private key are generated when the system boots for the first time.

Command History

Release R11.7.0	Command was introduced.

Usage Examples

The following example generates a new https certificate:

```
(config)#http secure-server certificate regenerate
Certificate:
   Data:
      Version: 3 (0x2)
      Serial Number:
         70:a2:aa:7c:8e:d8:ef:b2:68:e1:58:65:55:84:69:81:19:91:7b:29
   Signature Algorithm: sha256WithRSAEncryption
      Issuer: C=US, ST=AL, L=Huntsville, O=Adtran, Inc., CN=NetVanta
      Validity
         Not Before: Jun 19 19:11:09 2015 GMT
         Not After : Jun 17 19:11:09 2023 GMT

ip dhcp

Use the **ip dhcp** command to manually release or renew Dynamic Host Control Protocol (DHCP) values. Releasing DHCP values causes the DHCP client to stop using information assigned by the DHCP server and releases that information. Renewing DHCP values causes the DHCP client to re-request information. Variations of this command include:

ip dhcp release
ip dhcp release <*interface*>
ip dhcp release efm-group <*group id*>
ip dhcp release mef-ethernet <*slot/port*>
ip dhcp release system-control-evc
ip dhcp release system-management-evc
ip dhcp renew
ip dhcp renew <*interface*>
ip dhcp renew efm-group <*group id*>
ip dhcp renew mef-ethernet <*slot/port*>
ip dhcp renew system-control-evc
ip dhcp renew system-management-evc

Syntax Description

<*interface*>	Optional. Specifies that DHCP information is released or renewed on the single interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **ip dhcp release ?** at the prompt.
efm-group <*group id*>	Specifies an Ethernet in the first mile (EFM) group ID. Range is **1** to **1024**.
mef-ethernet <*slot/port*>	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Specifies that DHCP information is released or renewed on the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Specifies that DHCP information is released or renewed on the system management EVC.

Default Values

By default, if DHCP has been enabled, then the IA_NA is released or renewed. If DHCP has not been enabled, then only non-address configuration information is released or renewed.

Command History

Release R11.1.0	Command was introduced.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group and Metro Ethernet Forum (MEF) Ethernet interface.

Usage Examples

The following example manually renews all non-address DHCP information:

>**enable**
#ip dhcp renew

ipv6 dhcp

Use the **ipv6 dhcp** command to release or renew Dynamic Host Control Protocol version 6 (DHCPv6) values manually. Releasing DHCPv6 values causes the DHCPv6 client to stop using information assigned by the DHCPv6 server and releases that information. Renewing DHCPv6 values causes the DHCPv6 client to rerequest information. Variations of this command include:

ipv6 dhcp release
ipv6 dhcp release address
ipv6 dhcp release address <*interface*>
ipv6 dhcp release all
ipv6 dhcp release all <*interface*>
ipv6 dhcp release information
ipv6 dhcp release information <*interface*>
ipv6 dhcp release prefix
ipv6 dhcp release prefix <*interface*>
ipv6 dhcp renew
ipv6 dhcp renew address
ipv6 dhcp renew address <*interface*>
ipv6 dhcp renew all
ipv6 dhcp renew all <*interface*>
ipv6 dhcp renew information
ipv6 dhcp renew information <*interface*>
ipv6 dhcp renew prefix
ipv6 dhcp renew prefix <*interface*>

Syntax Description

address	Optional. Specifies that only the DHCPv6 identity association non-temporary address (IA_NA) is released or renewed.
all	Optional. Specifies that all DHCPv6 values are released or renewed.
information	Optional. Specifies that only DHCPv6 non-address configuration information is released or renewed.
prefix	Optional. Specifies that only the DHCPv6 identity association prefix definition (IA_PD) is released or renewed.
<*interface*>	Optional. Specifies that DHCPv6 information is released or renewed on the single interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **ipv6 dhcp release ?** at the prompt.

Default Values

By default, if DHCPv6 has been enabled, then the IA_NA is released or renewed. If DHCPv6 has not been enabled, then only non-address configuration information is released or renewed.

Command History

Release R10.9.0	Command was introduced.
Release R10.11.0	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Usage Examples

The following example manually renews non-address DHCPv6 information:

>**enable**
#ipv6 dhcp renew information

led status-led

Use the **led status-led** command to control the status LED on an applicable AOS device. This command can be used to turn off the LED, as well as control both the LED color and blink rate. Use the **no** form of this command to return to the default setting. Variations of this command include:

led status-led [green | red]
led status-led [green | red] blink [fast | slow]
led status-led red-green
led status-led off

Syntax Description

green	Modifies the status LED display to green.
red	Modifies the status LED display to red.
red-green	Modifies the status LED to alternate between red and green
blink	Specifies the status LED blink rate. If the blink rate is not specified, the display color will be solid (i.e., non-blinking).
fast	Specifies a blink rate of five times per second.
slow	Specifies a blink rate of once per second.
off	Turns off the status LED.

Default Values

By default, the status LED is solid green.

Command History

Release R11.6.0	Command was introduced.
Release R11.7.0	Command was expanded to include the **red-green** parameter.

Functional Notes

This command does not save to the startup configuration file. When the device reboots, the status LED display returns to the default setting.

Usage Examples

The following example changes the status LED display to slow, blinking red:

>enable
#led status-led red blink slow

license activate <*activation key*>

Use the **license activate** <*activation key*> command to specify up to five license activation keys for activating licensed features on your AOS device.

Syntax Description

<*activation key*>	Specifies the activation key to use for licensing AOS features. Up to **5** activation keys can be entered using this command.

Default Values

No default values are necessary for this command.

Command History

Release R13.4.0	Command was introduced.

Functional Notes

The activation keys used in this command are provided to you by Adtran when you purchase AOS features. When this command is issued, the entered activation keys are automatically sent to a licensing server (specified using the command *license server on page 1570*), and then the features are automatically licensed on the AOS unit.

This two-step licensing procedure, configuring a license server and activating license keys, replaces the four-step licensing process introduced in AOS firmware release R11.8.0. For more information about the AOS feature licensing process, refer to the quick start guide, *Licensing AOS Features*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example three activation keys are sent to the licensing server for automatic feature licensing on the AOS device:

```
>enable
#license activate key1 key2 key3 key 4 key 5
```

license capability

Options for licensing AOS features depends on the AOS firmware installed on the AOS device. The AOS firmware 14.3.0 supports both Legacy Licensing and New Licensing solutions. The New Licensing solution is streamlined into a 4-step process which is configurable using AOS CLI or GUI.

license capability request
license capability request key <actId1>
license capability request key <actId1> <actId2>
license capability request key <actId1> <actId2> <actId3>
license capability request key <actId1> <actId2> <actId3> <actId4>
license capability request key <actId1> <actId2> <actId3> <actId4> <actId5>
license capability response key install *<filename>*
license capability response key uninstall

Syntax Description

request	Manage the capability request
key	Generate the capability request bin file without specifying the activation IDs.
<**Activation Id**>	Optional. Specify the activation IDs up to a maximum of 5 Activation IDs for generating the capability request bin file.
response	Install or uninstall a software license from the unit.
key	Install or uninstall a software license from the unit.
install	Install a software license.
file	Specifies the software license file.
<filename>	Specifies the capability response bin file to install the license.
uninstall	Uninstalls the software license.

Default Values

No default values are necessary for this command.

Command History

Release R14.3.0	Command was introduced.

Functional Notes

AOS uses two types of key files for activating licensed AOS features.

Activate by using the capability response file:

The capability response file is obtained from the Adtran licensing portal for the AOS features purchased on your adtran email account. The capability response file can be imported to the device's flash and installed using the CLI “license capability response key install file <filename>” to activate the purchased AOS features.

Activate by using the Capability request file:

Before you begin, you must verify that you have your Activation key(s) for each AOS feature you want to license in the confirmation email after your purchase. Next, you will generate a License Capability Request bin file from the AOS unit on which you want to enable the newly purchased features. The generated License Capability Request bin file is saved to the device's flash. The bin file is then exported through secure copy or tftp to your machine. This will generate the capability Response bin file from Adtran licensing portal.The capability response downloaded will have the license mapped to your device with your existing call capacity and features. The capability response is imported to the Device Flash and installed using “license capability response key install file <filename>” command which activates the AOS features.

Usage Examples

Providing activation IDs is optional. The following example generates a capability request without any activation IDs. The capability request file is then exported to the Adtran licensing server to generate and download the capability response file for installing the license on your device.

>**enable**
#license capability request key

The following example generates the capability request that sets activation IDs that you received when you registered your Adtran email account.

>**enable**
#license capability request key actId1 actId2 actId3

The following example installs the capability response bin file <capabilityResponse.bin> on the unit for activating AOS features.

>**enable**
#license capability response key install file capabilityResponse.bin
The following example uninstalls the software license from device. A reboot is required on the unit after the uninstall command is issued to ensure the software license was completely removed.

>**enable**
#license capability response key uninstall
#reload

license key

Use the **license key** command to install or remove license keys for the purpose of enabling AOS features on a device. Variations of this command include:

license key install
license key install file *<filename>*
license key uninstall all
license key uninstall invalid
license key uninstall unsupported
license key uninstall *<software license serial number>*

Syntax Description

install	Indicates that a license key is about to be entered into the AOS device. Once entered, this command prompts the user for input (as shown in the **Usage Examples** below) unless the command includes the **file** *<filename>* parameter.
file *<filename>*	Optional. Specifies a file name for installing a license key.
uninstall	Specifies removing license keys on the system.
all	Specifies removing all license keys.
invalid	Specifies removing invalid license keys only.
unsupported	Specifies removing unsupported license keys only.
<serial number>	Specifies a license serial number to remove.

Default Values

No default values are necessary for this command.

Command History

Release R11.8.0	Command was introduced.

Functional Notes

AOS uses two types of keys for enabling additional licensed AOS features. The license key is obtained from the Adtran licensing portal and installed on the AOS device in order to activate additional features. This process of obtaining a license key requires a second key, called a license request key (or a challenge key). The license request key is a unique key generated by AOS and contains information about the unit that validates it for a one time use only. Once a license key has been installed, the license request key is cleared and no longer valid.

The **license request key** command will not display a key until the **license request key generate** command has been issued for the first time. Generating a new license request key clears any previous license request keys, in which case a warning is issued.

Usage Examples

The following example prepares AOS to receive a license key to enable additional features:

>**enable**
#license key install
Enter the entire license key. End with two consecutive
carriage returns or the word "quit" on a line by itself:
quit

The following example removes all license keys currently on the device:

>**enable**
#license key uninstall all

license request key

Use the **license request key** command to view or generate a license request (challenge) key which is used to request a license key for enabling AOS features on a device. Variations of this command include:

license request key
license request key generate

Syntax Description

generate	Optional. Generates a license request key.

Default Values

No default values are necessary for this command.

Command History

Release R11.8.0	Command was introduced.

Functional Notes

AOS uses two types of keys for enabling additional licensed AOS features. The license key is obtained from the Adtran licensing portal and installed on the AOS device in order to activate additional features. This process of obtaining a license key requires a second key, called a license request key (or a challenge key). The license request key is a unique key generated by AOS and contains information about the unit that validates it for a one time use only. Once a license key has been installed, the license request key is cleared and no longer valid.

The **license request key** command will not display a key until the **license request key generate** command has been issued for the first time. Generating a new license request key clears any previous license request keys, in which case a warning is issued.

Usage Examples

The following example generates a license request key:

```
>enable
#license request key generate

WARNING!
This will generate a new license request key.
You will not be able to install licenses that
were requested using any previous license request key.

This action is irreversible.

Proceed? [yes/no]
```

The following example displays the current active license request key:

>**enable**
#license request key

license unit identifier

Use the **license unit identifier** command to view the unit identification (ID) used for requesting AOS feature license keys.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.8.0	Command was introduced.

Functional Notes

The unit ID is a unique number that identifies a specific AOS unit. It is included in the license request key sent to the Adtran licensing portal.

AOS uses two types of keys for enabling additional licensed AOS features. The license key is obtained from the Adtran licensing portal and installed on the AOS device in order to activate additional features. This process of obtaining a license key requires a second key, called a license request key (or a challenge key). The license request key is a unique key generated by AOS and contains information about the unit that validates it for a one time use only. Once a license key has been installed, the license request key is cleared and no longer valid.

The **license request key** command will not display a key until the **license request key generate** command has been issued for the first time. Generating a new license request key clears any previous license request keys, in which case a warning is issued.

Usage Examples

The following example displays the current unit identifier:

```
>enable
#license unit identifier
```

logout

Use the **logout** command to terminate the current session and return to the login screen.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example shows the logout command being executed in Enable mode:

```
>enable
#logout
Session now available
Press RETURN to get started.
```

mount usbdrive0

Use the **mount usbdrive0** command to mount a Universal Serial Bus (USB) flash drive device.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.

Usage Examples

The following example mounts a USB flash drive device onto the AOS unit:

```
>enable
#mount usbdrive0
```

nslookup

Use the **nslookup** command to view and troubleshoot domain naming system (DNS) information by querying the configured or specified DNS server. Variations of this command include:

nslookup
nslookup <*hostname* | *ip address*>
nslookup <*hostname* | *ip address*> **server** <*hostname* | *ip address*>
nslookup <*hostname* | *ip address*> **server** <*hostname* | *ip address*> **type** <*type*>
nslookup <*hostname* | *ip address*> **type** <*type*>
nslookup vrf <*name*>
nslookup vrf <*name*> <*hostname* | *ip address*>
nslookup vrf <*name*> <*hostname* | *ip address*> **server** <*hostname* | *ip address*>
nslookup vrf <*name*> <*hostname* | *ip address*> **server** <*hostname* | *ip address*> **type** <*type*>
nslookup vrf <*name*> <*hostname* | *ip address*> **type** <*type*>

Syntax Description

<*hostname* | *ip address*>	Specifies the fully qualified domain name (FQDN) or destination IP address to be used as the target of the DNS query. IPv4 addresses should be expressed in dotted decimal notation (for example, **208.61.209.1**). IPv6 addresses should be expressed in colon hexadecimal notation (for example, **2001:DB8:1::1**).
server <*hostname* | *ip address*>	Optional. Specifies the FQDN or IP address of the DNS server to query.
type <*type*>	Optional. Specifies the type of DNS query. Supported query types include: **A**, **AAAA**, **SRV**, **SOA**, **CNAME**, **PTR**.
vrf <*name*>	Optional. Specifies the non-default virtual routing and forwarding (VRF) instance on which the DNS query will be sent.

Default Values

No default values are necessary for this command.

Command History

R13.3.0	Command was introduced.

Usage Examples

The following example returns the result of a DNS **A** record query for **www.example.com** from the server at **198.51.100.1**:

>**enable**
#nslookup www.example.com server 198.51.100.1 type a
DNS Server: 198.51.100.1 53

ANSWER SECTION:
Host : www.example.com
Type : A
TTL : 6662
Address : 198.51.100.100

ping

Use the **ping** command (at the Enable mode prompt) to verify IPv4 network connectivity. For information on how to verify IPv6 network connectivity, refer to *ping ipv6 on page 520*. Variations of this command include:

ping
ping [ip] <*ipv4 address* | *hostname*>
ping [ip] <*ipv4 address* | *hostname*> <*interface*>
ping [ip] <*ipv4 address* | *hostname*> **data** <*string*>
ping [ip] <*ipv4 address* | *hostname*> **df-bit [0 |1]**
ping [ip] <*ipv4 address* | *hostname*> **dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ip] <*ipv4 address* | *hostname*> **repeat** <*number*>
ping [ip] <*ipv4 address* | *hostname*> **size** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
ping [ip] <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*>
ping [ip] <*ipv4 address* | *hostname*> **system-control-evc**
ping [ip] <*ipv4 address* | *hostname*> **system-management-evc**
ping [ip] <*ipv4 address* | *hostname*> **timeout** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **tos** <*value*>
ping [ip] <*ipv4 address* | *hostname*> **verbose**
ping [ip] <*ipv4 address* | *hostname*> **wait** <*interval*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **data** <*string*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **df-bit [0 |1]**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **repeat** <*number*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **size** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-control-evc**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-management-evc**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **timeout** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **tos** <*value*>
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **verbose**
ping [ip] vrf <*name*> <*ipv4 address* | *hostname*> **wait** <*interval*>

After specifying the target IPv4 address to ping, the other parameters can be entered in any order. Use the ***?*** *after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

ip	Optional. Specifies an IPv4 ping.
<*interface*>	Optional. Specifies the egress interface when pinging an IPv4 address. Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **ping** <*ipv4 address* | *hostname*> **?** to display a list of valid interfaces.
<*ipv4 address* | *hostname*>	Optional. Specifies the IPv4 address or host name of the system to ping. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**). Entering the **ping** command with no specified Internet Protocol version 4 (IPv4) address prompts the user with parameters for a more detailed **ping** configuration. Refer to *Functional Notes* (below) for more information.
data <*string*>	Optional. Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ECHO_REQ packets.
df-bit 0	Optional. Specifies that the Don't Fragment (DF) bit in the IP header is not set.
df-bit 1	Optional. Specifies setting the DF bit in the IP header. This will prevent the ping packets from being fragmented along the way.
dscp	Optional. Specifies the differentiated services code point (DSCP) value.
<*value*>	Optional. Valid range is decimal **0** to **63**. The value can also be specified in hexadecimal by adding a **0x** prefix to the number.
af*xx*	Optional. Specifies the assured forwarding (AF) class and subclass for the DSCP value. Select from: 11 (001010), 12 (001100), 13 (001110), 21 (010010), 22 (010100), 23 010110), 31 (011010), 32 (011100), 33 (011110), 41 (100010), 42 (100100), or 43 (100110).
cs*x*	Optional. Specifies the class selector (CS) value for the DSCP value. Valid range for *x* is **0** to **7**.
default	Optional. Specifies default (000000) DSCP value.
ef	Optional. Specifies expedited forwarding (EF) (101110) for the DSCP value.
repeat <*number*>	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size <*value*>	Optional. Specifies the datagram size (in bytes) of the ping packet. Valid range is **1** to **65507** bytes. Except for most switches which have a maximum of **29000**.
source <*ipv4 address*>	Optional. Specifies the IPv4 address to use as the source address in the ECHO_REQ (or interface) packets. The source IPv4 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.
mef-ethernet <*slot/port*>	Optional. Specifies the Metro Ethernet Forum (MEF) Ethernet interface as the ping target.
system-control-evc	Optional. Specifies the system control Ethernet virtual connection (EVC) as the ping target.
system-management-evc	Optional. Specifies the system management EVC as the ping target.

tos <*value*>	Optional. Specifies the type of service (ToS). The <*value*> can be specified as decimal (**0** to **255)** or as hexidecimal.
timeout <*value*>	Optional. Specifies the timeout period after which the ping is considered unsuccessful. Valid range is **1** to **60** seconds.
verbose	Optional. Enables detailed messaging.
vrf <*name*>	Optional. Specifies the VRF where the IPv4 address exists.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending test packets. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **data** pattern is set to **abcd**.

By default, the **df-bit** is set to **0**.

By default, the **repeat** is set to **5**.

By default, the **size** value is set to **100** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **wait** value is set to **100** milliseconds.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.2	Command was expanded to include the **verbose** and **wait** parameters, also changes were made to the **repeat** and **timeout** values.
Release 17.4	Command was expanded to include the **count** and **interval** parameters. The **repeat** and **wait** parameters were removed.
Release A4.01	Command was expanded to return the **wait** parameter.
Release 18.3.0	Command was expanded to include the optional **ip** and <*interface*> parameters.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **df-bit**, **dscp**, **system-control-evc**, **system-management-evc**, and **tos** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.
Release R11.1.0	Functional Notes were enhanced to explain parameter behaviour with multiple entries.

Functional Notes

The **ping** command can be issued from both the Basic and Enable modes.

The **ping** command helps diagnose basic IPv4 network connectivity using the Packet Internet Groper program to repeatedly bounce Internet Control Message Protocol version 4 (ICMPv4) ECHO_REQ packets off a system (using a specified IPv4 address). AOS allows executing a standard **ping** request to a specified IP address, or provides a set of prompts to configure a more specific **ping** configuration.

After specifying the target IPv4 address (or hostname) to ping, the following parameters can be entered multiple times and in any order: **data**, **df-bit**, **repeat**, **size**, **source**, and **timeout**. When entering multiple instances of the same parameter, the last entry will be used. In the following example syntax, only the last entries for **data**, **repeat**, and **size** will be used, ignoring previous entries for these parameters:

ping ip 192.0.2.15 size 600 data bbbb repeat 3 size 300 data aaaa repeat 2 verbose dscp cs4 size 200

The following is a list of output messages from the **ping** command:

!	Success
-	Destination Host Unreachable
$	Invalid Host Address
X	TTL Expired in Transit
?	Unknown Host
*	Request Timed Out

The following is a list of available extended **ping** fields with descriptions:

Extended Commands	Specifies whether additional commands are desired for more ping configuration parameters. Answer yes (**y**) or no (**n**).
Source Address	Specifies the IPv4 address to use as the source address in the ECHO_REQ (or interface) packets.
Data Pattern	Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ECHO_REQ packets.
Sweep Range of Sizes	Varies the sizes of the ECHO_REQ packets transmitted.
Sweep Min Size	Specifies the minimum size of the ECHO_REQ packet. Valid range is **0** to **65507**.
Sweep Max Size	Specifies the maximum size of the ECHO_REQ packet. Valid range is the sweep minimum size to **65507**.
Sweep Interval	Specifies the interval used to determine packet size when performing the sweep. Valid range is **1** to **65507**.
Verbose Output	Specifies an extended results output.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is an example of a successful **ping** command:

>**enable**
#ping

```
VRF Name [-default-]:
Target IP address:192.168.0.30
Repeat count [5]:5
Datagram Size [100]:100
Timeout in seconds [2]:2
Wait interval in milliseconds [100]:100
Extended Commands? [n]:n
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
      '*' = Request timed out, '-' = Destination host unreachable
      'x' = TTL expired in transit, 'e' = Unknown error

Sending 5, 100-byte ICMP Echos to 192.168.0.30, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

ping ethernet

Use the **ping ethernet** command to initiate a loopback message from one Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoint (MEP) to another MEP. These loopback messages are used to test the accessibility of the destination MEP. Variations of this command include:

ping ethernet <*target-mac-address* | *target-mep-id*>
ping ethernet <*target-mac-address* | *target-mep-id*> **count** <*number*>
ping ethernet <*target-mac-address* | *target-mep-id*> **data** <*pattern*>
ping ethernet <*target-mac-address* | *target-mep-id*> **domain** <*domain name*> **association** <*association name*>
ping ethernet <*target-mac-address* | *target-mep-id*> **domain none association** <*association name*>
ping ethernet <*target-mac-address* | *target-mep-id*> **drop-eligible**
ping ethernet <*target-mac-address* | *target-mep-id*> **interface** <*interface*>
ping ethernet <*target-mac-address* | *target-mep-id*> **mep** <*mep id*>
ping ethernet <*target-mac-address* | *target-mep-id*> **priority** <*priority*>
ping ethernet <*target-mac-address* | *target-mep-id*> **repeat** <*number*>
ping ethernet <*target-mac-address* | *target-mep-id*> **size** <*bytes*>
ping ethernet <*target-mac-address* | *target-mep-id*> **timeout** <*timeout*>
ping ethernet <*target-mac-address* | *target-mep-id*> **validate-data**
ping ethernet <*target-mac-address* | *target-mep-id*> **verbose**
ping ethernet <*target-mac-address* | *target-mep-id*> **wait** <*interval*>

After specifying the target for the loopback messages, the other parameters can be entered in any order.

Syntax Description

<*target-mac-address* | *target-mep-id*>	Specifies the destination for the loopback message. Medium access control (MAC) addresses are entered in the format **HH:HH:HH:HH:HH:HH**. Target MEP IDs are the unique numerical values identifying MEPs. MEP IDs range from **1** to **8191**.
count <*number*>	Optional. Specifies the number of loopback messages to send. Range is **1** to **1000000**.
data <*pattern*>	Optional. Specifies the pattern to be carried in the data time length value (TLV) of the loopback message. Pattern is up to four hexadecimal digits. Pattern range is **0** to **ffff**.
domain <*domain name*>	Optional. Specifies the maintenance domain to which the transmitting MEP belongs.
domain none	Optional. Specifies no maintenance domain.
association <*association name*>	Optional. Specifies the maintenance association to which the transmitting MEP belongs.

drop-eligible	Optional. Specifies the drop eligible bit value in the virtual local area network (VLAN) tag.
interface <*interface*>	Optional. Specifies the interface on which the transmitting MEP is configured. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.
mep <*mep id*>	Specifies the MEP ID of the transmitting MEP. MEP ID range is **1** to **8191**.
priority <*priority*>	Optional. Specifies the 802.1 priority bits that are sent in the loopback message. Range is **0** to **7**.
repeat <*number*>	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size <*bytes*>	Optional. Specifies the size of the loopback message. Size ranges from **1** to **60** bytes.
timeout <*timeout*>	Optional. Specifies the time that the MEP will wait for a response to the loopback message. Range is **0** to **60** seconds.
validate-data	Optional. Specifies whether or not the transmitting MEP validates the contents of the data TLV in the received loopback messages.
verbose	Optional. Specifies that the results are in detailed, rather than summary, format.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending loopback messages. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **count** value is set to **5**.

By default, the **data** pattern is set to **abcd**.

By default, the **drop-eligible** value is not set.

By default, the **interval** is set to **1000** milliseconds.

By default, the **priority** value is the priority specified in the MEP's configuration.

By default, the **size** value is set to **2** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **validate-data** parameter is disabled.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface and the **wait** and **repeat** parameters.

Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

The **ping ethernet** command can be issued from both the Basic and Enable modes.

If the MEP ID is used as the target, the remote MEP must exist in the MEP continuity check message (CCM) database (meaning the remote MEP is transmitting valid CCMs) so that the MEP ID can be translated to the MAC address before the loopback message is transmitted.

Both the **domain** <*domain name*> and **association** <*association name*> parameters are not required if the source MEP ID of the MEP is specified and unique through the AOS device.

If the domain and association of the transmitting MEP are specified, and there is only one MEP in that domain or association, or if there is only one MEP configured on the unit, the **mep** <*mep id*> parameter is not required.

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

This command will not appear in the command line interface (CLI) unless Ethernet OAM CFM is enabled. To enable Ethernet OAM CFM, refer to the command *ethernet cfm on page 1273*.

Usage Examples

The following example initiates the Ethernet ping utility from an MEP in **Domain1** association **MA1** with a destination to an MEP with an MEP ID of **201**:

```
>enable
#ping ethernet 201 domain Domain1 association MA1
        Type CTRL+C to abort.
        Legend:    '!' = Success, '*' = Request timed out, 'd' = Data Mismatch
                   'o' = Out of order, '.' = No reply, 'e' = Unknown error.

        Sending 5, 100-byte LBRs to MEP 201 from MEP 1, timeout is 2 seconds:
        !!!!!
        Success rate is 100 percent (5/5), round-trip min/avg/max = 202/668/1011 ms
```

ping ipv6

Use the **ping ipv6** command (at the Enable mode prompt) to verify IPv6 network connectivity. For information on how to verify IPv4 network connectivity, refer to *ping on page 512*. Variations of this command include:

ping [ipv6] <*ipv6 address*>
ping [ipv6] <*ipv6 address*> <*interface*>
ping [ipv6] <*ipv6 address*> **data** <*string*>
ping [ipv6] <*ipv6 address*> **destination-option**
ping [ipv6] <*ipv6 address*> **df-bit [0 |1]**
ping [ipv6] <*ipv6 address*> **dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ipv6] <*ipv6 address*> **hop-by-hop-option**
ping [ipv6] <*ipv6 address*> **repeat** <*number*>
ping [ipv6] <*ipv6 address*> **size** <*value*>
ping [ipv6] <*ipv6 address*> **source** <*ipv6 address*>
ping [ipv6] <*ipv6 address*> **mef-ethernet** <*slot/port*>
ping [ipv6] <*ipv6 address*> **system-control-evc**
ping [ipv6] <*ipv6 address*> **system-management-evc**
ping [ipv6] <*ipv6 address*> **timeout** <*value*>
ping [ipv6] <*ipv6 address*> **tos** <*value*>
ping [ipv6] <*ipv6 address*> **verbose**
ping [ipv6] <*ipv6 address*> **wait** <*interval*>
ping [ipv6] vrf <*name*> <*ipv6 address*>
ping [ipv6] vrf <*name*> <*ipv6 address*> <*interface*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **data** <*string*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **destination-option**
ping [ipv6] vrf <*name*> <*ipv6 address*> **df-bit [0 |1]**
ping [ipv6] vrf <*name*> <*ipv6 address*>**dscp [**<*value*> | **af***xx* | **cs***x* | **default** | **ef]**
ping [ipv6] vrf <*name*> <*ipv6 address*> **hop-by-hop-option**
ping [ipv6] vrf <*name*> <*ipv6 address*> **repeat** <*interval*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **size** <*value*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **source** <*ipv6 address*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **mef-ethernet** <*slot/port*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **system-control-evc**
ping [ipv6] vrf <*name*> <*ipv6 address*> **system-management-evc**
ping [ipv6] vrf <*name*> <*ipv6 address*> **timeout** <*value*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **tos** <*value*>
ping [ipv6] vrf <*name*> <*ipv6 address*> **verbose**
ping [ipv6] vrf <*name*> <*ipv6 address*> **wait** <*interval*>

After specifying the target IPv6 address to ping, the other parameters can be entered in any order. Use the **?** *after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

ipv6	Optional. Specifies an IPv6 ping.
<interface>	Specifies the egress interface when pinging an IPv6 link-local address (any address that has the prefix **FE80::/64**). Interfaces are specified in the *<interface type> <slot/port | interface id>* format. For example, for an Ethernet interface, use **eth 0/1**. Type **ping ipv6** *<ipv6 address>* **?** to display a list of valid interfaces. This variable is mandatory when pinging a link-local address. This variable is ignored when using a non-link-local address.
<ipv6 address>	Specifies the IPv6 address of the system to ping. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **ping ipv6** command using a link-local destination address prompts the user for an egress interface.
data *<string>*	Optional. Specifies an alphanumerical string to use (the ASCII equivalent) as the data pattern in the ICMPv6 ECHO_REQ packets.
destination-option	Optional. Includes the destination option in the ICMPv6 ECHO_REQ packets.
df-bit 0	Optional. Specifies that the Don't Fragment (DF) bit in the IP header is not set.
df-bit 1	Optional. Specifies setting the DF bit in the IP header. This will prevent the ping packets from being fragmented along the way.
dscp	Optional. Specifies the differentiated services code point (DSCP) value.
<value>	Optional. Valid range is decimal **0** to **63**. The value can also be specified in hexadecimal by adding a **0x** prefix to the number.
af*xx*	Optional. Specifies the assured forwarding (AF) class and subclass for the DSCP value. Select from: 11 (001010), 12 (001100), 13 (001110), 21 (010010), 22 (010100), 23 010110), 31 (011010), 32 (011100), 33 (011110), 41 (100010), 42 (100100), or 43 (100110).
cs*x*	Optional. Specifies the class selector (CS) value for the DSCP value. Valid range for *x* is **0** to **7**.
default	Optional. Specifies default (000000) DSCP value.
ef	Optional. Specifies expedited forwarding (EF) (101110) for the DSCP value.
hop-by-hop-option	Optional. Includes the hop-by-hop option in the ICMPv6 ECHO_REQ packets. This typically causes intermediate routers to process switch the packets, potentially detecting switching issues in these devices.
repeat *<number>*	Optional. Specifies the number of loopback messages to be sent. Range is **1** to **1024**.
size *<value>*	Optional. Specifies the datagram size (in bytes) of the ping packet. Valid range is **1** to **1448** bytes.

source <*ipv6 address*>	Optional. Specifies the IPv6 address to use as the source address in the ICMPv6 ECHO_REQ (or interface) packets. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **ping ipv6** command using a link-local destination address prompts the user for an egress interface. The source IPv6 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.
mef-ethernet <*slot/port*>	Optional. Specifies that the Metro Ethernet Forum (MEF) Ethernet interface is the ping target.
system-control-evc	Optional. Specifies that the system control Ethernet virtual connection (EVC) is the ping target.
system-management-evc	Optional. Specifies that the system management EVC is the ping target.
tc <*value*>	Optional. Specifies the traffic class (TC). The <*value*> can be specified as decimal **0** to **255**, or as hexidecimal
timeout <*value*>	Optional. Specifies the timeout period after which the ping is considered unsuccessful. Valid range is **1** to **60** seconds.
tos <*value*>	Optional. Specifies the type of service (ToS). The <*value*> can be specified as decimal (**0** to **255)** or as hexidecimal.
verbose	Optional. Enables detailed messaging.
vrf <*name*>	Optional. Specifies the VRF where the IPv6 address exists.
wait <*interval*>	Optional. Specifies a minimum time to wait between sending test packets. Valid range is **100** to **60000** milliseconds.

Default Values

By default, the **data** pattern is set to **abcd**.

By default, the **df-bit** is set to **0**.

By default, the **repeat** is set to **5**.

By default, the **size** value is set to **100** bytes.

By default, the **timeout** value is set to **2** seconds.

By default, the **wait** value is set to **100** milliseconds.

Command History

Release 18.1	Command was introduced.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **df-bit**, **dscp**, **system-control-evc**, **system-management-evc**, and **tos** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

The **ping ipv6** command can be issued from both the Basic and Enable modes.

The **ping ipv6** command helps diagnose basic IPv6 network connectivity using the Packet Internet Groper program to repeatedly bounce Internet Control Message Protocol version 6 (ICMPv6) ECHO_REQ packets off a system (using a specified IPv6 address). AOS allows executing a standard **ping ipv6** request to a specified IPv6 address, or provides keywords to configure a more specific **ping ipv6** configuration.

The following is a list of output messages from the **ping ipv6** command:

!	Success
-	Destination Host Unreachable
$	Invalid Host Address
x	TTL Expired in Transit
?	Unknown Host
*	Request Timed out
e	Unknown Error
B	Packet too Big

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example pings **2001:DB8:1A0::3** with **200** byte ICMPv6 ECHO_REQ packets:

```
>enable
#ping ipv6 2001:DB8:1A0::3 size 200
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
      '*' = Request timed out, '-' = Destination host unreachable
      'x' = TTL expired in transit, 'e' = Unknown error
      'B' = Packet too big

Sending 5, 200-byte ICMP Echos to 2001:DB8:1A0::3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

ping stack-member <*number*>

Use the **ping stack-member** command to ping a member of the stack. Variations of this command include:

ping stack-member <*number*>
ping stack-member <*number*> **vrf** <*name*>

Syntax Description

<*number*>	Specified which member of the stack to ping.
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) where the stack-member exists.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

The **ping stack-member** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example pings a member of the stack:

```
>enable
#ping stack-member 3
Type CTRL+C to abort.
Legend: '!' = Success, '?' = Unknown host, '$' = Invalid host address
      '*' = Request timed out, '-' = Destination host unreachable
      'x' = TTL expired in transit
Sending 5, 100-byte ICMP Echos to 169.254.0.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 2/2.2/3 ms
#
```

ping twamp

Use the **ping twamp** command to execute a Two-Way Active Measurement Protocol (TWAMP) type ping to measure the packet loss, delay, and interpacket delay variation (IPDV) and display the results of the test. Use the subcommands in any combination, in any order, when specifying the destination site. Variations of this command include:

ping twamp
ping twamp <*ip address* | *hostname*>
ping twamp <*ip address* | *hostname*> **control-port** <*port*>
ping twamp <*ip address* | *hostname*> **data pattern**
ping twamp <*ip address* | *hostname*> **data pattern ascii** <*pattern*>
ping twamp <*ip address* | *hostname*> **data pattern hex** <*pattern*>
ping twamp <*ip address* | *hostname*> **data random**
ping twamp <*ip address* | *hostname*> **data zero**
ping twamp <*ip address* | *hostname*> **dscp** <*value*>
ping twamp <*ip address* | *hostname*> **interval** <*value*>
ping twamp <*ip address* | *hostname*> **port** <*port*>
ping twamp <*ip address* | *hostname*> **repeat** <*value*>
ping twamp <*ip address* | *hostname*> **size** <*value*>
ping twamp <*ip address* | *hostname*> **source** <*ip address*>
ping twamp <*ip address* | *hostname*> **source-port** <*port*>
ping twamp <*ip address* | *hostname*> **timeout** <*value*>
ping twamp <*ip address* | *hostname*> **verbose**
ping twamp <*ip address* | *hostname*> **wait** <*value*>
ping twamp vrf <*name*>
ping twamp vrf <*name*> <*ip address* | *hostname*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **control-port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern**
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern ascii** <*pattern*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data pattern hex** <*pattern*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **data random**
ping twamp vrf <*name*> <*ip address* | *hostname*> **data zero**
ping twamp vrf <*name*> <*ip address* | *hostname*> **dscp** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **interval** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **repeat** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **size** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **source** <*ip address*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **source-port** <*port*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **timeout** <*value*>
ping twamp vrf <*name*> <*ip address* | *hostname*> **verbose**

ping twamp vrf <*name*> <*ip address* | *hostname*> **wait** <*value*>

*The subcommands can be used in a string of any available combination. Use the **?** after each specified subcommand for a valid list of arguments and settings.*

Syntax Description

<*ip address* | *hostname*>	Optional. Specifies the IP address or host name of the system to ping. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**). Entering the **ping twamp** command with no specified IP address prompts the user with parameters for a more detailed **ping twamp** configuration.
control-port <*port*>	Optional. Specifies the destination TWAMP control port. Port range is **1** to **65535**.
data	Optional. Specifies data used to pad packets. The following options are available:
pattern	Pads the packet with a user-specified pattern.
ascii <*pattern*>	Pads the packet with a user-specified ascii pattern.
hex <*pattern*>	Pads the packet with a user-specified hex pattern.
random	Pads the packet with random numbers.
zero	Pads the packet with all zeros.
dscp <*value*>	Optional. Specifies the differentiated services code point (DSCP) value. Valid range is **0** to **63**.
interval <*value*>	Optional. Specifies the interval between consecutive ping TWAMPs (in milliseconds). Valid range is **5** to **5000**.
port <*port*>	Optional. Specifies the destination port for the TWAMP test packets. Valid range is **1** to **65535**.
repeat <*value*>	Optional. Specifies the number of ping TWAMP packets. Valid range is **1** to **1000**.
size <*value*>	Optional. Specifies the datagram size. Valid range is **0** to **1462**.
source <*ip address*>	Optional. Specifies the source IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
source-port <*port*>	Optional. Specifies the source port for the TWAMP test packets. Valid range is **1** to **65535**.
timeout <*value*>	Optional. Specifies the timeout value in milliseconds. Valid range is **100** to **60000**.
verbose	Optional. Displays the detailed two-way ping verbose results for the specified IP address or host name.
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) instance within which the ping is executed. If no VRF is specified, the default (unnamed) VRF is used.

wait <*value*>	Optional. Specifies the interval (in milliseconds) between consecutive TWAMP test packets. Range is **5** to **5000**.

Default Values

By default, the **data** is **zero,** the **dscp** is **0**, the **interval** value is **20,** the **port** value is **0,** the repeat value is **100**, the **size** is **0**, and the **timeout** is **2000** milliseconds.

Command History

Release 17.4	Command was introduced to replace the **twping** command.
Release 17.6	Command was expanded to include **control-port** and **wait** keywords.
Release A4.01	Command was expanded to include the **ascii** and **hex** pattern parameters.
Release R11.2.0	Command was expanded to include the **vrf** parameter.

Functional Notes

The **ping twamp** command can be issued from both the Basic and Enable modes.

Usage Examples

The following example executes a TWAMP ping:

```
>enable
#ping twamp
2009.06.03 11:18:24 IP.TWPING CTRL EVNT Attempting to connect
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Init -> Opening (event=Open Connection)
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Opening -> Setup (event=RX
    Server-Greeting)
2009.06.03 11:18:24 IP.TWPING CTRL EVNT State changed Setup -> Starting (event=TX
    Setup-Response)
2009.06.03 11:18:24 IP.TWPING CTRL PKT Sending Setup-Response (len=140)
 mode=1
 keyId=00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
       00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
--MORE--
```

port-auth re-authenticate

Use the **port-auth re-authenticate** command to force the reauthentication of every currently authorized host on all interfaces in the AOS unit. Variations of this command include:

port-auth re-authenticate
port-auth re-authenticate <*interface*>

Syntax Description

<*interface*>	Optional. Specifies reauthentication of a specific interface. Interfaces are specified in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **port-auth re-authenticate ?** for a complete list of available interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.

Usage Examples

The following example specifies that the authorized hosts on the interface **eth 1/1** are reauthenticated:

>enable
#port-auth re-authenticate eth 1/1

ramdisk <*size*>

Use the **ramdisk** command to create a volatile RAM disk file system and allocate memory in bytes to the newly created RAM disk. Use the **no** form of this command to delete the RAM disk.

*Not all units are capable of using a RAM disk file system. Use the **?** command to display a list of valid commands at the enable prompt.*

Syntax Description

<*size*>	Specifies the size of the RAM disk in bytes. Valid range is **65536** to the maximum available heap size on the unit. Input for this value allows the use of the following characters as multipliers: **M**, **m**, **K**, and **k**.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced.

Usage Examples

The following example creates a volatile RAM disk file system and allocates **128000** bytes of memory:

```
>enable
#ramdisk 128000
```

The following example creates a volatile RAM disk file system and uses the multiplier **k** to allocate 131072 bytes of memory (where **128k** is 128 x 1024 = 131072):

```
>enable
#ramdisk 128k
```

reload

Use the **reload** command to perform a manual reload of AOS. Variations of this command include:

reload
reload cancel
reload hard
reload in <*delay*>
reload soft
reload vcid <*vcid*>

*Performing an AOS **reload** disrupts data traffic.*

Syntax Description

cancel	Optional. Deactivates a pending **reload** command.
hard	Optional. Performs a hard reload.
in <*delay*>	Optional. Specifies a delay period in minutes (mm) or hours and minutes (hh:mm) that AOS will wait before reloading.
soft	Optional. Performs a soft reload.
vcid <*vcid*>	Optional. Specifies an ActivChassis member to reload. Valid range is **1** to **8**. VCID values **1** and **2** are for the master and backup device, respectively. The VCID of the current master device will not be accepted.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release AC1.0	Command was expanded to include the **vcid** parameter.
Release R10.10.0	Command was expanded to include the **hard** and **soft** parameters.

Usage Examples

The following example reloads the AOS software in 3 hours and 27 minutes:

>**enable**
#reload in 03:27

The following example reloads the AOS software in 15 minutes:

>**enable**
#reload in 15

The following example terminates a pending reload command:

>**enable**
#reload cancel

The following example reloads ActivChassis member **3**:

>**enable**
#reload vcid 3

reload dot11 interface dot11ap *<ap interface>*

Use the **reload dot11 interface dot11ap** command to perform a cold start of a wireless access point (AP) that is currently controlled by the wireless access controller (AC) on which the command is executed. Variations of this command include:

reload dot11 interface dot11ap *<ap interface>*
reload dot11 interface dot11ap *<ap interface>* **factory-default**

Syntax Description

<ap interface>	Specifies the AP interface number to reload. Range is **1** to **8**.
factory-default	Optional. Specifies reloading the unit with the factory default settings.

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example performs a cold start for AP interface 1:

```
>enable
#reload dot11 interface dot11ap 1
AP 1 reloaded
Router#
2006.12.23 19:14:03 DOT11.Session : AP 1: AP reboot.
2006.12.23 19:14:03 DOT11.Session : AP 1: Control session lost.
2006.12.23 19:14:03 DOT11.Session : AP 1: Control session established.
```

rename

Use the **rename** command to rename a file stored in the AOS product. Variations of this command include:

rename <*source filename*> <*destination filename*>
rename cflash <*source filename*> <*destination filename*>
rename flash <*source filename*> <*destination filename*>
rename usbdrive0 <*source filename*> <*destination filename*>

Syntax Description

cflash	Optional. Specifies the file to be renamed is on the Compact flash drive.
flash	Optional. Specifies the file to be renamed is on the flash drive.
usbdrive0	Optional. Specifies the file to be renamed is on the Universal Serial Bus (USB) drive.
<*source filename*>	Specifies the file to be renamed.
<*destination filename*>	Specifies the new name of the file.

Default Values

No default values are necessary for this command.

Command History

Release R10.10	Command was introduced.

Functional Notes

If no drive is specified (**cflash**, **flash**, or **usbdrive0**), this command is executed in the first mounted drive.

An error is displayed if you attempt rename the file with the same name, or if a file by the destination filename already exists.

Files cannot be renamed from one file system to another. For example, a file in flash cannot be renamed in Cflash).

Usage Examples

The following example renames the file **File1** in the flash drive to **File3**:

>**enable**
#rename flash File1 File3

run audit security

Use the **run audit security** command to run a security audit on the AOS device. Variations of this command include:

run audit security
run audit security log
run audit security log cflash
run audit security log usbdrive0

Once the audit is in process, the session will be blocked until the audit is completed or until Ctrl+C is issued.

Syntax Description

cflash	Optional. Specifies saving the log file to CompactFlash® memory.
log	Optional. Specifies saving the audit results to a file named **securityAudit_**<*timestamp*>. The file name has the timestamp attached in the format yyyymmddhhmmss. If **cflash** is not specified, the file is saved to flash memory.
usbdrive0	Optional. Specifies saving the log file to Universal Serial Bus (USB) flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced.
Release 18.2	Command was expanded to include the **usbdrive0** parameter.

Functional Notes

The security audit tool is used to identify possible security violations. The results of the audit can be viewed by using the **show audit security** command (refer to *show audit security on page 552*), or by viewing the log file using the commands *show flash on page 653* or *show cflash on page 580*.

The **show audit security** command displays a summary of the security audit results including: the type of defect, severity, and a brief description. The **show audit security detail** command lists the summary, as well as details of the defect and recommends corrective action. It is up to the customer to determine if the findings are a true risk in their system, and to make the necessary adjustments to their configuration. Some items could be recorded as possible risks that are not actual risks based on the entire network configuration.

If two people are logged in simultaneously (for example, one via Telnet and one via the console) and both try to run the audit security tool, the user who begins the audit first will take precedence. An error message will be displayed to the second user that an audit is in progress.

The following table lists the configuration items that are audited for security risks.

Violation Type	Severity	Description
Startup-Config	High	Indicates that the startup configuration file does not match the running configuration file. This is determined by comparing the MD5 checksum of both files for a match.
Passwords/Keys	High	Identifies nonsecure passwords. If a password has MD5 encryption enabled, the tool tests for common password sequences, such as qwerty, 1234, abc, xyz, etc. If MD5 is disabled, an alert is issued if the password: • Is less than 7 characters. • Does not contain alphabetic and numeric characters. • Matches common sequences, such as qwerty, 1234, abc, xyz, etc. • Matches the default passwords. • Matches another password in the system. • Service password encryption is not enabled.
Firewall	High	Indicates the firewall is disabled.
Policy-Class	High	Identifies any of the following access control policy (ACP) vulnerabilities: • Stateful inspection is disabled. • An undefined access control list (ACL) exists in the ACP. • An interface with a private IP address (10.x.x.x, 172.16.x.x, 192.168.x.x) has an ACP assigned that does not have NAT configured. • An interface is enabled without an ACP assigned.
SNMP	High	Indicates the SNMP agent is enabled and configured to allow SNMPv1 or SNMPv2. Both of these versions are considered nonsecure. SNMPv3 group and SNMPv3 user are preferred.
Network Protocols	High	Identifies any of the following network protocols are enabled and considered a security risk: HTTP, HTTPS SSLv2, FTP, TFTP, and Telnet. SSH is suggested as a replacement for Telnet and HTTPS SSLv3 instead of HTTPS SSLv2.

Violation Type	Severity	Description
WIFI	High	Identifies any of the following wireless vulnerabilities: • Security mode is set to anything but WPA2 (including none). • Service set identifier (SSID) broadcast is enabled. • A weak key.
Session Timeout	High	Identifies the console, HTTP, SSH, or Telnet session timeout is set to a value greater than 15 minutes. Long session timeouts can compromise the system. The recommended setting is 15 minutes or less.
Time-Server	High	Indicates the time server (SNTP or NTP) is not configured or is configured but not synchronized. It is important to have a valid timestamp on all logs generated by the system.
Logging	Medium	Indicates user activity is not being logged. User activity should be logged either by enabling syslog or TACACS+ accounting. (The syslog can be enabled by using the **logging forwarding on** command.)
Domain Lookup	Medium	Indicates **domain-lookup** is enabled but a DNS server has not been configured. This allows DNS requests to be broadcast.
Interfaces	Medium	Identifies the following interface vulnerabilities: • The **ip directed-broadcast** is enabled which could make an interface vulnerable to denial of service attacks. • A static ACL assigned to an interface. A more secure option is to enable the firewall and assign an ACP.
Enable Password	Low	Indicates the enable password is not set for MD5 encryption. MD5 encryption is more secure than standard password encryption.
Banner	Low	Indicates the default executive banner is still set. It is recommended that a custom banner be displayed when a user attempts to login. The banner warns of the legal consequences of unauthorized access to the unit.
TCL Scripts	Low	Indicates Tcl scripting is enabled. Scripts could cause damage to configuration of the unit.

Usage Examples

The following example initiates the security audit and saves the results to a log file in flash memory:

>**enable**
#run audit security log
Audit Complete

run checkdisk cflash

Use the **run checkdisk cflash** to run checkdisk to check and fix file system errors. This command should only be issued promptly after system reboot while voicemail processes are idle. Issuing the command while voicemail processes are active could result in file system corruption.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A4.03	Command was introduced.

Usage Examples

The following example checks and fixes file system errors:

```
>enable
#run checkdisk cflash
```

run checkdisk usbdrive0

Use the **run checkdisk usbdrive0** to run checkdisk to check and fix file system errors on the Universal Serial Bus (USB) drive. Variations of this command include:

run checkdisk usbdrive0
run checkdisk usbdrive0 dontfix

Syntax Description

dontfix	Specifies the unit to run checkdisk on the USB flash drive without fixing errors.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.

Usage Examples

The following example checks and fixes file system errors on the USB flash drive:

>**enable**
#run checkdisk usbdrive0

run tcl *<name>*

Use the **run tcl** command to initiate a tool command language (Tcl) script.

Syntax Description

<name>	Specifies the name of the Tcl script file or inline Tcl script to run.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release R11.1.1	Command was expanded to include inline scripts.

Usage Examples

The following example initiates the **test1.tcl** Tcl script file:

```
>enable
#run tcl test1.tcl

Script execution complete

#
```

run voipwizard

Use the **run voipwizard** command to run the Voice over IP (VoIP) Setup Wizard. This wizard configures the basic settings for running VoIP applications on switchports. After running the wizard, you can view the log file using the command *show voipwizard log on page 1111*.

> NOTE *The wizard changes the current configuration of the unit. If the unit has already been configured, the changes could conflict with current settings. You will be able to review the changes before applying them to the system.*

Syntax Description

No subcommands.

Default Values

There is no default setting for this command.

Command History

Release R11.3.0	Command was introduced.

Functional Notes

When running the VoIP Setup Wizard, you are given the option of applying the recommended settings or specifying your own settings. If you enter **yes** to accept the recommended settings, the wizard will configure the settings and ask for confirmation before applying them.

If you choose to specify your own settings instead of applying the recommendations, enter **no**, and the wizard will step you through the different setting options as shown in the following example:

```
>enable
#run voipwizard

Welcome to the VoIP Configuration Wizard.

This wizard will assist you in configuring your NetVanta 1234 for
switching. You may automatically apply Adtran's recommended VoIP settings or
specify your own port assignments.

WARNING: This will change the current configuration of the unit. If this unit
has already been configured, the following changes may conflict with the
current settings. You will be able to review your changes before they are
applied.

Adtran VoIP Recommendation:

Ports assigned as voice ports: (switchport 0/1-24)
Ports assigned as uplink ports: (gigabit-switchport 0/1-4)
```

Voice port configuration: description voice
spanning-tree edgeport
no shutdown
switchport voice vlan 2
qos trust cos

Uplink port configuration: description uplink
no shutdown
switchport mode trunk
qos trust cos

Global QoS configuration: qos queue-type wrr 25 25 25 expedite
qos cos-map 1 0 1
qos cos-map 2 2 4
qos cos-map 3 3 6
qos cos-map 4 5 7

Would you like to apply this recommendation? [yes/no]

no

What would you like to use as your voice vlan? (1-4094) [default: 2]

2

What are the types of interfaces you would like to configure as voice ports?

--- Options ---
1. switchport
2. gigabit-switchport

[default: switchport]

Specify one or more port types. (Examples: 1,2,1-2)
Enter your selection:

1
Selected: switchport

For the 'switchport' interface type, which ports would you like to
assign as voice ports? Enter port numbers or ranges of port numbers separated
by commas. (Example: 1,2,3-9,13,15) [default: 1-24]

1-24

What are the types of interfaces you would like to configure as uplink ports?

--- Options ---

1. switchport
2. gigabit-switchport

[default: gigabit-switchport]

Specify one or more port types. (Examples: 1,2,1-2)
Enter your selection:

2

Selected: gigabit-switchport

For the 'gigabit-switchport' interface type, which ports would you like to
assign as uplink ports? Enter port numbers or ranges of port numbers separated
by commas. (Example: 1,2,3-9,13,15) [default: 1-4]

1-4

Would you like to enable port security on all voice ports?
(yes/no) [default: no]

yes

How many mac addresses would you like to allow on each voice
port? (1-132) [default: 2]

2

Selected VoIP configuration:

Ports assigned as voice ports: (switchport 0/1-24)
Ports assigned as uplink ports: (gigabit-switchport 0/1-4)

Voice port configuration: description voice
spanning-tree edgeport
no shutdown
switchport voice vlan 2
qos trust cos
switchport port-security
switchport port-security maximum 2

Uplink port configuration: description uplink
no shutdown
switchport mode trunk
qos trust cos

Global QoS configuration: qos queue-type wrr 25 25 25 expedite
qos cos-map 1 0 1

```
qos cos-map 2 2 4
qos cos-map 3 3 6
qos cos-map 4 5 7
```

Would you like to apply this configuration? [yes/no]

yes

Saving configuration...
Configuration successfully saved!

Thank you for using the VoIP Configuration Wizard.
Goodbye.

Script execution complete

Usage Examples

The following example initiates the VoIP Setup Wizard:

>**enable**
#run voipwizard

show activchassis

Use the **show activchassis** command to display information about ActivChassis members. Variations of this command include:

show activchassis
show activchassis detail
show activchassis <*vcid*>
show activchassis <*vcid*> **detail**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

detail	Optional. Specifies that detailed ActivChassis information is displayed, including the ActivChassis ID (VCID), the connection state, and the role of the member, as well as additional information.
<*vcid*>	Optional. Specifies that information about a specific ActivChassis member is displayed. VCID range is **1** to **8**. VCID values of **1** and **2** are given to the master and backup devices, respectively.

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.

Functional Notes

This command is available from both the ActivChassis master and linecard devices' CLI. In the linecard command mode, only the master and linecard ActivChassis members are displayed. If the linecard has not been admitted to the ActivChassis, the command only displays the linecard information.

For more information about the difference between linecard and master devices, and how to access the CLI for each, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example displays detailed information about all ActivChassis members:

>**enable**
#show activchassis detail
VCID: 1 (NV1638)
ActivChassisVC Connection State: Connected
Role: Master
Connection Information: none
ActivChassisVC Ports:
  Xgiga-switchport 1/1/1
  Xgiga-switchport 1/1/2

VCID: 4 (NV 1638)
ActivChassisVC Connection Sate: Not Connected
Role: Linecard
Connection Information: “This device has the wrong AOS version. The correct version is AC1.0.”
ActivChassisVC Ports:
  Xgiga-switchport 4/0/1
  Xgiga-switchport 4/0/1

show arp

Use the **show arp** command to display the Address Resolution Protocol (ARP) table. Variations of this command include:

show arp
show arp realtime
show arp vrf <*name*>
show arp vrf <*name*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance or your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
vrf <*name*>	Optional. Displays information only for the specified virtual routing and forwarding (VRF). If a VRF is not specified, the default VRF is assumed.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show arp** command:

```
>enable
#show arp
ADDRESS         TTL(min)    MAC ADDRESS        INTERFACE    TYPE
10.22.18.3      19          00:E0:29:6C:BA:31  eth 0/1      Dynamic
192.168.20.2    16          00:A0:C8:0D:E9:AD  eth 0/2      Dynamic
224.0.0.5       20          01:00:5E:00:00:05  eth 0/2      Permanent
```

show as-path-list

Use the **show as-path-list** command to display any AS path lists that have been configured in the router, along with any permit and deny clauses in each list. Variations of this command include:

show as-path-list
show as-path-list *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Specifies that the command display only the list matching the specified AS path list name. If not specified, all AS path lists are displayed.

Default Values

By default, this command displays all AS path lists.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R10.1.0	Command syntax was changed and the **ip** keyword was removed for all AOS products.

Usage Examples

In the following example, all AS path lists defined in the router are displayed.

```
>enable
#show as-path-list
as-path-list AsPathList1:
 permit 100
 permit 200
 permit 300
 deny 6500
as-path-list AsPathList2:
 permit 400
 permit 500
```

show atm pvc

Use the **show atm pvc** command to display information specific to the asynchronous transfer mode (ATM) interface's permanent virtual circuit (PVC). Variations of this command include the following:

show atm pvc
show atm pvc interfaces atm <*interface*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interfaces atm <*interface*>	Optional. Displays the ATM PVC information for a specific PVC. Specify an ATM interface (valid range is **1** to **1023**) or a subinterface in the format <*interface id.subinterface id*> (for example, **1.1**). Using this command without specifying an interface will display all information for all ATM PVCs.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show atm pvc interfaces** command:

```
>enable
#show atm pvc interface atm 1.1
```

Name	VPI	VCI	Encap Type	SC	Peak Kbps	Avg/Min Kbps	Burst Cells	Status
atm 1.1	0	200	SNAP	N/A	0	0	0	Active

show atm traffic interface atm <*interface*>

Use the **show atm traffic interface atm** command to display traffic information specific to the asynchronous transfer mode (ATM) interface.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Specifies an ATM port number. Specify an ATM interface (valid range is **1** to **1023**) or a subinterface in the format *<interface id.subinterface id>* (for example, **1.1**).

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show atm traffic** command from ATM interface 1:

```
>enable
#show atm traffic interface atm 1
atm 1 is UP, line protocol is UP
 BW 896 Kbit/s
 16 maximum active VCCs, 16 VCCs per VP, 1 current VCCs
Queueing strategy: Per VC Queueing
 5 minute input rate 32 bits/sec, 0 packets/sec
 5 minute output rate 0 bits/sec, 0 packets/sec
    19 packets input, 1357 bytes
    0 pkts discarded, 0 error pkts, 0 unknown protocol pkts
    45 cells received, 0 OAM cells received
    0 packets output, 0 bytes
    0 tx pkts discarded, 0 tx error pkts 0 internal tx error pkts
    0 cells sent, 0 OAM cells sent
```

The following is sample output from the **show atm traffic** command from ATM subinterface 1.1:

#show atm traffic interface atm 1.1
27 Input Packets
0 Output Packets
72 Cells received, 0 OAM cells received
F5 InEndLoopReq: 0 F5 InEndLoopResp: 0 F5 InAIS: 0 F5 InRDI: 0
0 Cells sent, 0 OAM cells sent
F5 OutEndLoopReq: 0 F5 OutEndLoopResp: 0 F5 OutAIS: 0 F5 OutRDI: 0
0 OAM Loopback Successes 0 OAM Loopback Failures

show audit security

Use the **show audit security** command to display the results of the security audit including: the type of defect, severity, and a brief description. The security audit must be initiated first using the command *run audit security on page 534*. Variations of this command include:

show audit security
show audit security detail

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays the details of the security audit and recommends corrective action.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced.

Functional Notes

The security audit tool is used to identify possible security violations and is initiated by using the command *run audit security on page 534*.

The **show audit security detail** command lists a summary of the results, as well as details of the defect and recommends corrective action. It is up to the customer to determine if the findings are a true risk in their system, and to make the necessary adjustments to their configuration. Some items could be recorded as possible risks that are not actual risks based on the entire network configuration.

Usage Examples

The following is sample output from the **show audit security** command:

>enable
#show audit security
Using 2214 bytes

SUMMARY

Severity	Type	Description
LOW	Enable Password	MD5 encryption is not enabled
HIGH	Network Protocol	FTP server enabled
HIGH	Network Protocol	TFTP server enabled
HIGH	Network Protocol	HTTP server enabled
HIGH	Network Protocol	Telnet enabled
HIGH	Policy-Class	Private, undefined ACL
HIGH	Policy-Class	Private, stateless
HIGH	Policy-Class	Public, stateless
HIGH	Policy-Class	Public, NAT not enabled
HIGH	Policy-Class	Interfaces using default policy-class
HIGH	Password	Weak Passwords
HIGH	Password	Duplicate Passwords
HIGH	Session Timeout	Console timeout >= 15 minutes
HIGH	Session Timeout	Telnet 0 timeout >= 15 minutes
HIGH	Session Timeout	Telnet 1 timeout >= 15 minutes
HIGH	Session Timeout	Telnet 2 timeout >= 15 minutes
HIGH	Session Timeout	Telnet 3 timeout >= 15 minutes
HIGH	Session Timeout	Telnet 4 timeout >= 15 minutes
HIGH	Session Timeout	SSH 0 timeout >= 15 minutes
HIGH	Session Timeout	SSH 1 timeout >= 15 minutes
HIGH	Session Timeout	SSH 2 timeout >= 15 minutes
HIGH	Session Timeout	SSH 3 timeout >= 15 minutes
HIGH	SNMP	Using SNMPv1/v2, not secure

The following is sample output from the **show audit security detail** command:

>**enable**
#show audit security detail
Using 4193 bytes

DETAIL

ENABLE PASSWORD:

* The enable password is not set for MD5 encryption. MD5 encryption is more secure than standard password encryption.

NETWORK PROTOCOLS:

* The following protocols are enabled and may be a security risk.
Disable if not needed. Use SSH instead of Telnet and HTTP SSLv3 instead of
HTTP SSLv2.

  * FTP
  * TFTP
  * HTTP
  * Telnet

POLICY-CLASS:

---

* Potential vulnerabilities were found with the following policies. Note: NAT
may not be required on all policies; however, broadcast of IP addresses from the
internal network to the Internet should be restricted. This tool did not take
into account how the policies are used. Depending upon the configuration of your
network, these policies may or may not make your network vulnerable.

****

Name	Line	Description
**********		
Private	2	Allows undefined ACL
Private	3	Allows stateless-inspection
Public	4	Allows stateless-inspection
Public	N/A	NAT not enabled for Private interface, eth 0/1

* The following interfaces are enabled but do not have a policy-class
assigned. Not having a policy-class assigned will leave the interface open to
attack.

  * vlan 1210

PASSWORDS / KEYS:

---

* Passwords should be at least 7 characters and have both alphabetic and
numeric characters. Some passwords are considered weak if they match default
passwords or contain common sequences. For example Qwerty123 is considered a
weak password even though it contains both numeric and alphabetic characters.
The following weak passwords were found:

  * 1f1965f156e907907d3a8ed5172557a86736(encrypted)
  * 2b2d9aa78c8dfb9fca1cf745d72e2e28cc99(encrypted)
  * 373fbaa34722617409e24b9d9a707cb09fe3(encrypted)
  * 1610d7b313a09983a2de5bb4f1a77997f346(encrypted)
  * 24223699587eef35644778c8a901cca82a70(encrypted)
  * 46400f529e54aeb56fa224fadb14c111f007(encrypted)

* Each user should have a unique password. The following passwords
are duplicated:

  * 2b2d9aa78c8dfb9fca1cf745d72e2e28cc99(encrypted)
  * 46400f529e54aeb56fa224fadb14c111f007(encrypted)

SESSION TIMEOUT:

---

* The following sessions have timeout values of 15 minutes or greater. Long
session timeouts may allow your system to be compromised. To increase
security, set the timeout value to less than 15 minutes.
* Console
  * Telnet 0
  * Telnet 1
  * Telnet 2
  * Telnet 3
  * Telnet 4
  * SSH 0
  * SSH 1
  * SSH 2
  * SSH 3

SNMP:

---

* The SNMP agent is enabled and is configured to allow SNMPv1 and
SNMPv2 which are not secure. If SNMP is needed, remove the community
names and add SNMPv3 group and SNMPv3 user.

---

show auto-config

Use the **show auto-config** command to display the AOS automatic self-configuration feature status and settings.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R10.5.0	Output was expanded to include the cause of the last failure.

Usage Examples

The following is sample output from the **show auto-config** command:

```
>enable
#show auto-config
Auto-Config is enabled, current status: Downloading.
File transfer method is TFTP
Config Server is 10.10.10.1
Config filename is Adtran_CONFIG.cfg
Default filename is [00A0C8AE103A.cfg | adtran_4700254F2.cfg |
adtran_000000000000.cfg], Current: (Disabled)
Maximum retry count is 0 (repeat indefinitely), total retries is 0
Last failure: HTTP: Could not send initial message to HTTP server
```

show auto-link

Use the **show auto-link** command to display the auto-link feature configuration and current status.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.3/A2	Command was introduced.

Usage Examples

The following is sample output of the **show auto-link** command:

```
>enable
#show auto-link
Auto-link: Enabled
   Use Http: Enabled
   Server URL: 10.14.1.55/aps/DiscoveryProcessor?action=devinfo
   Server SERVER: 10.14.1.55
   Recontact Interval: 3600 seconds
   Last Contact: Tue, June 17, 2008 10:32:01 AM
   Next Contact: Tue, June 17, 2008 11:30:23 AM
   Status: Discovered
```

show battery

Use the **show battery** command to display battery information. Variations of this command include:

show battery
show battery <*slot/port*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*slot/index*>	Optional. Specifies the slot and port of the battery information in the format <*slot/port*>, for example, **0/1**.

Default Values

No default values are necessary for this command.

Command History

Release R11.10.0	Command was introduced.
Release R11.11.0	Command output options were altered and noted in the Functional Notes section.

Functional Notes

The output information displays the battery status **Good**, **Failure**, **Charging**, **Unknown**, **Not Connected**, or **Low**. The current power source displays either **AC** or **Battery**, indicating where the unit is currently sourcing power.

Usage Examples

The following example displays battery information for slot **0**, port **1**:

>enable
#show battery 0/1

```
Battery 0/1 Information
===========================
Battery Status          : Good
Current Power Source    : AC
Battery Install Date    : June 12 2015, 12:40:34
```

show bgp

Use the **show bgp** command to display details about Border Gateway Protocol (BGP) configuration on the AOS device, including the specified route, advertising router IPv4 or IPv6 address, router ID, and the list of neighbors to which this route is being advertised. Variations of this command include:

show bgp any-vrf ipv4
show bgp any-vrf ipv4 *<ipv4 address>*
show bgp any-vrf ipv4 *<ipv4 address> <subnet mask>*
show bgp any-vrf ipv4 summary
show bgp ipv4
show bgp ipv4 *<ipv4 address>*
show bgp ipv4 *<ipv4 address> <subnet mask>*
show bgp ipv4 summary
show bgp vrf *<name>* **ipv4**
show bgp vrf *<name>* **ipv4** *<ipv4 address>*
show bgp vrf *<name>* **ipv4** *<ipv4 address> <subnet mask>*
show bgp vrf *<name>* **ipv4 summary**
show bgp any-vrf ipv6
show bgp any-vrf ipv6 *<ipv6 address/prefix-length>*
show bgp any-vrf ipv6 summary
show bgp ipv6
show bgp ipv6 *<ipv6 address/prefix-length>*
show bgp ipv6 summary
show bgp vrf *<name>* **ipv6**
show bgp vrf *<name>* **ipv6** *<ipv6 address/prefix-length>*
show bgp vrf *<name>* **ipv6 summary**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

any-vrf	Optional. Displays BGP information for all virtual routing and forwarding (VRF) instances.
ipv4	Displays IPv4 BGP route information.
ipv6	Displays IPv6 BGP route information.
vrf *<name>*	Optional. Displays BGP information for a specific VRF instance.
<ipv4 address>	Optional. Specifies a valid IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

<subnet mask>	Optional. Specifies the subnet mask that corresponds to a range of IPv4 addresses (network) or a specific host. Subnet masks can be expressed in dotted decimal notation (for example, **255.255.255.0**) or as a prefix length (for example, **/24**).
<ipv6 address/prefix-length>	Optional. Specifies a valid IPv6 address and prefix. IPv6 addresses should be expressed in colon hexadecimal format (for example, **2001:DB8:3F::/48**).
summary	Optional. Displays the status of all BGP connections.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. Command was also expanded to include the **any-vrf**, **ipv4**, and **vrf** <*name*> parameters.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products. Command was also expanded to include the **ipv6** and <*ipv6 address/prefix-length*> parameters.

Usage Examples

The following sample output of the **show bgp ipv4 summary** command shows a summarized list of the configured BGP neighbors, as well as their status and statistics.

>**enable**
#show bgp ipv4 summary
BGP router identifier 192.168.3.1, local AS number 304
8 network entries, 5 paths, and 23 BGP path attribute entries

Neighbor	V	AS	MsgRcvd	MsgSent	InQ	OutQ	Up/Down	State/PfxRcd
10.22.131.1	4	302	95	104	0	0	01:30:06	9
10.22.131.9	4	302	97	105	0	0	01:30:07	21
10.22.132.9	4	303	200	179	0	0	02:43:09	21
10.22.134.1	4	304	166	178	0	0	02:43:15	3
10.22.134.10	4	304	174	179	0	0	02:43:24	7
10.22.134.26	4	304	172	174	0	0	02:41:43	10
10.22.134.34	4	304	164	174	0	0	02:41:40	4

show bgp community

Use the **show bgp community** command to display only those routes learned using Border Gateway Protocol (BGP) that match the community numbers specified in the command. If no communities are specified, all BGP routes containing a community attribute are shown. Variations of this command include:

show bgp any-vrf ipv4 community
show bgp any-vrf ipv4 community <*number*>
show bgp any-vrf ipv4 community exact
show bgp any-vrf ipv4 community internet
show bgp any-vrf ipv4 community local-as
show bgp any-vrf ipv4 community no-advertise
show bgp any-vrf ipv4 community no-export
show bgp ipv4 community
show bgp ipv4 community <*number*>
show bgp ipv4 community exact
show bgp ipv4 community internet
show bgp ipv4 community local-as
show bgp ipv4 community no-advertise
show bgp ipv4 community no-export
show bgp vrf <*name*> **ipv4 community**
show bgp vrf <*name*> **ipv4 community** <*number*>
show bgp vrf <*name*> **ipv4 community exact**
show bgp vrf <*name*> **ipv4 community internet**
show bgp vrf <*name*> **ipv4 community local-as**
show bgp vrf <*name*> **ipv4 community no-advertise**
show bgp vrf <*name*> **ipv4 community no-export**
show bgp any-vrf ipv6 community
show bgp any-vrf ipv6 community <*number*>
show bgp any-vrf ipv6 community exact
show bgp any-vrf ipv6 community internet
show bgp any-vrf ipv6 community local-as
show bgp any-vrf ipv6 community no-advertise
show bgp any-vrf ipv6 community no-export
show bgp ipv6 community
show bgp ipv6 community <*number*>
show bgp ipv6 community exact
show bgp ipv6 community internet
show bgp ipv6 community local-as
show bgp ipv6 community no-advertise
show bgp ipv6 community no-export
show bgp vrf <*name*> **ipv6 community**
show bgp vrf <*name*> **ipv6 community** <*number*>
show bgp vrf <*name*> **ipv6 community exact**
show bgp vrf <*name*> **ipv6 community internet**

show bgp vrf <*name*> **ipv6 community local-as**
show bgp vrf <*name*> **ipv6 community no-advertise**
show bgp vrf <*name*> **ipv6 community no-export**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

any-vrf	Optional. Displays BGP information for all virtual routing and forwarding (VRF) instances.
ipv4	Displays IPv4 BGP route information.
ipv6	Displays IPv6 BGP route information.
vrf <*name*>	Optional. Displays BGP information for a specific VRF instance.
<*number*>	Optional. Displays routes that contain this value in their community attribute. This is a numeric value that can be an integer from **1** to **4294967295** or string in the form ***aa:nn***, where the value of ***aa*** is the autonomous system (AS) number and the value of ***nn*** is the desired local preference to be used in the service provider network. Multiple community-number parameters can be present in the command.
exact	Optional. Displays only BGP routes that have the same communities.
internet	Optional. Displays routes that contain this value in their community attribute. This represents the well-known reserved community INTERNET.
local-as	Optional. Displays routes that contain this value in their community attribute. This represents the well-known reserved community string NO_EXPORT_SUBCONFED. Routes containing this attribute should not be advertised to external BGP peers.
no-advertise	Optional. Displays routes containing this value in the community attribute. This represents the well-known reserved community string NO_ADVERTISE. Routes containing this attribute should not be advertised to any BGP peer.
no-export	Optional. Displays routes containing this value in the community attribute. This represents the well-known reserved community string NO_EXPORT. Routes containing this attribute should not be advertised to BGP peers outside a confederation boundary.

Default Values

By default, this command displays all BGP routes.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. Command was also expanded to include the **any-vrf**, **ipv4**, **vrf** <*name*>, and **exact** parameters.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products. Command was also expanded to include the **ipv6** parameter.

Usage Examples

In the following example, all BGP routes are displayed whose community numbers match those listed in the **show bgp community** command.

```
>enable
#show bgp ipv4 community local-as 10:405
BGP local router ID is 10.22.131.241, local AS is 302.
Status codes: * valid, > best, i - internal, o - local
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Network	Next Hop	Metric	LocPrf	Path
10.22.152.20/30	10.22.131.10	304		302 300 1 3 4 i
10.22.152.24/29	10.22.131.10	304		302 300 1 3 4 5 i
10.22.152.36/30	10.22.131.10	304		302 300 1 3 4 i
10.22.152.52/30	10.22.131.10	304		302 300 1 3 4 i
11.0.0.0/30	10.22.131.10	304		302 300 1 3 4 6 i
12.0.0.0/30	10.22.131.10	304		302 300 1 3 4 6 i
13.0.0.0/30	10.22.131.10	304		302 300 1 3 4 6 i
14.0.0.0/30	10.22.131.10	304		302 300 1 3 4 6 i

```
Total RIB entries = 8
```

Information displayed includes: the ID of this router and its autonomous system (AS) number; the destination Network address of the route learned; the Next-Hop address to that network; the Metric; the Local Preference (LocPrf) value (set using the command **set local-preference**); and the AS Path to the destination network.

The following is sample output for the **show bgp ipv4 community** command with an exact match specified. BGP routes with the community numbers specified and *only* those specified are shown.

>**enable**
#show bgp ipv4 community 1001 2001 3001 exact
BGP local router ID is 192.168.9.1, local AS is 252.
Status codes: * valid, > best, i - internal, o - local
Origin codes: i - IGP, e - EGP, ? - incomplete

Network	NextHop	Metric	LocPrf	Path
* 192.168.11.0/24	10.22.27.251	249	251	i

Total RIB entries = 4

show bgp community-list

Use the **show bgp community-list** command to display Border Gateway Protocol (BGP) routes that are permitted by the specified community list. Variations of this command include:

show bgp any-vrf ipv4 community-list *<list name>*
show bgp any-vrf ipv4 community-list *<list name>* **exact**
show bgp ipv4 community-list *<list name>*
show bgp ipv4 community-list *<list name>* **exact**
show bgp vrf *<name>* **ipv4 community-list** *<list name>*
show bgp vrf *<name>* **ipv4 community-list** *<list name>* **exact**
show bgp any-vrf ipv6 community-list *<list name>*
show bgp any-vrf ipv6 community-list *<list name>* **exact**
show bgp ipv6 community-list *<list name>*
show bgp ipv6 community-list *<list name>* **exact**
show bgp vrf *<name>* **ipv6 community-list** *<list name>*
show bgp vrf *<name>* **ipv6 community-list** *<list name>* **exact**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

any-vrf	Optional. Displays BGP information for all virtual routing and forwarding (VRF) instances.
ipv4	Displays IPv4 BGP route information.
ipv6	Displays IPv6 BGP route information.
vrf *<name>*	Optional. Displays BGP information for a specific VRF instance.
<list name>	Specifies the name of the community list whose routes you wish to display.
exact	Optional. Restricts the routes displayed to only those whose community lists exactly match those specified in the named community list. If this parameter is omitted, all routes matching any part of the specified community list will be displayed.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. The command was also expanded to include the **any-vrf**, **ipv4**, and **vrf** <*name*> parameters.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products. The command was also expanded to include the **ipv6** parameter.

Functional Notes

Information displayed includes the ID of this router and its autonomous system (AS) number, the destination Network address of the route learned, the Next-Hop address to that network, the Metric, the Local Preference (LocPrf) value (set using the command **set local-preference *** on ????), and the AS Path to the destination network.

Usage Examples

In the following example, all IPv4 BGP routes are displayed whose community numbers match those defined in the community list named CList1.

```
>enable
#show bgp ipv4 community-list CList1
BGP local router ID is 10.22.131.241, local AS is 302.
Status codes: * valid, > best, i - internal, o - local
Origin codes: i - IGP, e - EGP, ? - incomplete
     Network          Next Hop         Metric     LocPrf     Path
     10.22.152.20/30  10.22.131.10     304                   302 300 1 3 4 i
     10.22.152.24/29  10.22.131.10     304                   302 300 1 3 4 5 i
     10.22.152.36/30  10.22.131.10     304                   302 300 1 3 4 i
     10.22.152.52/30  10.22.131.10     304                   302 300 1 3 4 i
     11.0.0.0/30      10.22.131.10     304                   302 300 1 3 4 6 i

```

show bgp neighbors

Use the **show bgp neighbors** command to display information for the specified Border Gateway Protocol (BGP) neighbor. Variations of this command include the following:

show bgp any-vrf ipv4 neighbors
show bgp any-vrf ipv4 neighbors <*ipv4 address*>
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **advertised-routes**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **received-routes**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **routes**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp any-vrf ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**
show bgp ipv4 neighbors
show bgp ipv4 neighbors <*ipv4 address*>
show bgp ipv4 neighbors <*ipv4 address*> **advertised-routes**
show bgp ipv4 neighbors <*ipv4 address*> **received-routes**
show bgp ipv4 neighbors <*ipv4 address*> **routes**
show bgp ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp ipv4 neighbors <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**
show bgp vrf <*name*> **ipv4 neighbors**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*>
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **advertised-routes**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **received-routes**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **routes**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp vrf <*name*> **ipv4 neighbors** <*ipv4 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**
show bgp any-vrf ipv6 neighbors
show bgp any-vrf ipv6 neighbors <*ipv6 address*>
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **advertised-routes**

show bgp any-vrf ipv6 neighbors <*ipv6 address*> **received-routes**
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **routes**
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp any-vrf ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**
show bgp ipv6 neighbors
show bgp ipv6 neighbors <*ipv6 address*>
show bgp ipv6 neighbors <*ipv6 address*> **advertised-routes**
show bgp ipv6 neighbors <*ipv6 address*> **received-routes**
show bgp ipv6 neighbors <*ipv6 address*> **routes**
show bgp ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp ipv6 neighbors <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**
show bgp vrf <*name*> **ipv6 neighbors**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*>
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **advertised-routes**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **received-routes**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **routes**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] advertised-routes**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] received-routes**
show bgp vrf <*name*> **ipv6 neighbors** <*ipv6 address*> **[mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] routes**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

any-vrf	Optional. Displays BGP information for all virtual routing and forwarding (VRF) instances.
ipv4	Displays IPv4 BGP route information.
ipv6	Displays IPv6 BGP route information.
vrf <*name*>	Optional. Displays BGP information for a specific VRF instance.
<*ipv4 address*>	Optional. Displays information for the specified neighbor. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
	If no IPv4 address is entered, information for all neighbors is displayed.
<*ipv6 address*>	Optional. Displays information for the specified neighbor. IPv6 addresses should be expressed in colon hexadecimal format (for example, **2001:DB8:1::1**).
	If no IPv6 address is entered, information for all neighbors is displayed.
advertised-routes	Optional. Displays all routes being advertised to the specified neighbor. Command output is the same as for **show bgp** except filtered to only the BGP routes being advertised to the specified neighbor.
received-routes	Optional. Displays all routes (accepted and rejected) advertised by the specified neighbor. Routes may be rejected by inbound filters, such as prefix list filters.
routes	Optional. Displays all accepted received routes advertised by the specified neighbor. Routes displayed have passed inbound filtering. This command output is the same as **show ip bgp** except the output is filtered to those learned from the specified neighbor.
mef-ethernet <*slot/port*>	Optional. Displays information for the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Displays information for neighbors in the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays information for neighbors in the system management EVC.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. Command was also expanded to include the **any-vrf**, **ipv4**, and **vrf** <*name*> parameters.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products. Command was also expanded to include the **ipv6** and <*ipv6 address*> parameters.

Release R10.10.0	Command was expanded to include the system control and system management EVCs.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

Entries that are not filtered by prefix lists are marked with an asterisk (*) to show they are valid. Entries that are deemed the best path to advertised route are marked with a caret (>).

Usage Examples

The following are output variations of the **show bgp ipv4 neighbors** command:

```
>enable
#show bgp ipv4 neighbors
BGP neighbor is 10.15.43.17, remote AS 100, external link
Configured hold time is 180, keepalive interval is 60 seconds
Default minimum time between advertisement runs is 30 seconds
Connections established 6; dropped 5
Last reset: Interface went down
 Connection ID: 15
   BGP version 4, remote router ID 8.1.1.1
   BGP state is Established, for 01:55:05
   Negotiated hold time is 180, keepalive interval is 60 seconds
   Message statistics:
    InQ depth is 0, OutQ depth is 0
Local host: 10.15.43.18, Local port: 179
         Sent     Rcvd
    Opens:1      1
    Notifications: 00
    Updates: 0   8
    Keepalives: 116116
    Unknown: 0 0
    Total: 117     125
Foreign host: 10.15.43.17, foreign port: 1048
   Flags: passive open

#show bgp ipv4 neighbors 10.15.43.34 advertised-routes
BGP local router ID is 10.0.0.1, local AS is 101.
Status codes: * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          NextHop          Metric Path
*>    1.0.0.0/8        10.15.43.17      1 100 i
*>    2.0.0.0/9        10.15.43.17      1 100 i
```

#show bgp ipv4 neighbors 10.15.43.17 received-routes

BGP local router ID is 10.0.0.1, local AS is 101.
Status codes: * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

	Network	NextHop	Metric Path
*>	1.0.0.0/8	10.15.43.17	1 100 i
*>	2.0.0.0/9	10.15.43.17	1 100 i

#show ip bgp neighbors 10.15.43.17 routes

BGP local router ID is 10.0.0.1, local AS is 101.
Status codes: * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

	Network	NextHop	Metric Path
*>	1.0.0.0/8	10.15.43.17	1 100 i
*>	2.0.0.0/9	10.15.43.17	1 100

show bgp regexp <*expression*>

Use the **show bgp regexp** command to display a summary of the Border Gateway Protocol (BGP) route table that includes routes whose autonomous system (AS) path matches the specified expression. Variations of this command include:

show bgp any-vrf ipv4 regexp <*expression*>
show bgp ipv4 regexp <*expression*>
show bgp vrf <*name*> **ipv4 regexp** <*expression*>
show bgp any-vrf ipv6 regexp <*expression*>
show bgp ipv6 regexp <*expression*>
show bgp vrf <*name*> **ipv6 regexp** <*expression*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*expression*>	Displays routes whose AS path matches the regular expression specified.
any-vrf	Optional. Displays BGP information for all virtual routing and forwarding (VRF) instances.
ipv4	Displays IPv4 BGP route information.
ipv6	Displays IPv6 BGP route information.
vrf <*name*>	Optional. Displays BGP information for a specific VRF instance.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products. Command was also expanded to include the **any-vrf**, **ipv4**, and **vrf** <*name*> parameters.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran voice products. Command was also expanded to include the **ipv6** parameter.

Functional Notes

Entries that are not filtered by prefix lists are marked with an asterisk (*) to show they are valid. Entries that are deemed the best path to advertised route are marked with a caret (>).

Usage Examples

The following sample output of the **show bgp ipv4 regexp _303_** command shows all of the entries in the BGP database that contain “303” in the AS path.

```
>enable
#show bgp ipv4 regexp _303_
BGP local router ID is 192.168.3.1, local AS is 304.
Status codes: * valid, > best, i - internal, o - local
Origin codes: i - IGP, e - EGP, ? - incomplete
Network              NextHop Metric      LocPrf Path

Total RIB entries = 30
```

show bridge

Use the **show bridge** command to display a list of all configured bridge groups (including individual members of each group). Enter an interface or a bridge number to display the corresponding list. Variations of this command include:

show bridge
show bridge <*interface*>
show bridge <*number*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*interface*>	Optional. Displays all bridge groups associated with the specific interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type the **show bridge ?** command to display a list of applicable interfaces.
<*number*>	Optional. Displays a specific bridge group.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) interface.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Usage Examples

The following is sample output from the **show bridge** command:

>**enable**
#show bridge
Total of 300 station blocks 295 free

Address	Action	Interface	Age	Rx Count	Tx Count
00:04:51:57:4D:5A	forward	eth 0/1	0	7133392	7042770
00:04:5A:57:4F:2A	forward	eth 0/1	0	402365	311642
00:10:A4:B3:A2:72	forward	eth 0/1	4	2	0
00:A0:C8:00:8F:98	forward	eth 0/1	0	412367	231
00:E0:81:10:FF:CE	forward	fr 1.17	0	1502106	1486963

show buffers

Use the **show buffers** command to display the statistics for the buffer pools on the network server. Variations of this command include:

show buffers
show buffers realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R12.1.0	Command was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

The **show buffers** command is not available on vAOS instances.

Usage Examples

The following is sample output from the **show buffers** command:

>**enable**
#show buffers
Buffer handles: 119 of 2000 used.

Pool	Size	Total	Used	Available	Max. Used
0	1800	1894	119	1775	122
1	2048	64	0	64	0
2	4096	32	0	32	0
3	8192	4	0	4	0

show buffers users

Use the **show buffers users** command to display a list of the top users of packet buffers. Typically, this command will only be used as a debug tool by Adtran personnel. Variations of this command include:

show buffers users
show buffers users realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R12.1.0	Command was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

The **show buffers users** command is not available for vAOS instances.

Usage Examples

The following is sample output from the **show buffers users** command:

>**enable**
#show buffers users
Number of users: 7

Ran	User	Count
1	0x0052f4f8	59
2	0x0051a4fc	32
3	0x00528564	8
4	0x0053c1c8	7
5	fixedsize	5
6	0x001d8298	2
7	0x0010d970	1
8	0x00000000	0
9	0x00000000	0
10	0x00000000	0
11	0x00000000	0

show cflash

Use the **show cflash** command to display a list of all files currently stored in CompactFlash® memory or details about a specific file stored in CompactFlash memory. Variations of this command include:

show cflash
show cflash *<filename>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<filename>	Optional. Displays details for a specified file located in flash memory. Enter a wildcard (such as ***.biz**) to display the details for all files matching the entered pattern.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show cflash** command:

```
>enable
#show cflash
(dir)      0 SystemDefaultPrompts
(dir)      0 VoiceMail
9377163 NV7100A-12-00-23-E.biz
11110890 sip.ld
8767439 NV7100A-11-03-02-E.biz
8771176 NV7100A-11-03-02d-E.biz
8773148 NV7100A-11-03-03-E.biz
48508928 bytes used, 207319040 available, 255827968 total
```

show channel-group

Use the **show channel-group** command to display detailed information regarding port aggregation of a specified channel group (i.e., channel groups and their associated ports). Variations of this command include the following:

show channel-group port-channel load-balance
show channel-group summary
show channel-group <*number*> **summary**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

port-channel load-balance	Displays the current load-balance scheme.
summary	Summarizes the state of all channel groups or of a specific channel group (if specified by the <*number*> argument).
<*number*>	Optional. Specifies the channel group using the channel group ID (16).

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show channel-group** command:

```
>enable
#show channel-group summary
Channel Group        Port channel        Associated Ports
---------------------  -----------------  ------------------------
1                    1                  eth 0/2 eth 0/3
2                    2                  eth 0/5 eth 0/6 eth 0/7
```

show clock

Use the **show clock** command to display the system time and date entered using the **clock set** command. Refer to *clock set <time> <day> <month> <year> on page 223* for more information. Variations of this command include:

show clock
show clock detail

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays more detailed clock information, including the time source.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays the current time and data from the system clock:

```
>enable
#show clock
23:35:07 UTC Tue Aug 20 2002
```

show cloudinit output-errors

Use the **show cloudinit output-errors** command to display any errors that occurred during the boot process of a virtual AOS (vAOS) instance.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R12.2.0	Command was introduced.

Functional Notes

vAOS has the ability to read special configuration files that are present in a virtual environment, and take them into consideration when making decisions about its initial configuration. If any errors occur during this process, they can be displayed using the **show cloudinit output-errors** command.

Usage Examples

The following example displays any errors that occurred in the vAOS boot process:

```
>enable
#show cloudinit output-errors
```

show command-mode

Use the **show command-mode** command to display the command mode in AOS for a specific set of configuration commands. There are multiple levels of access within AOS from which users are allowed to execute configuration commands. This command is used to verify the mode to which access must be granted to execute a specific set of commands. This command is used for setting privilege levels for users to access the AOS CLI. Variations of this command include:

do show command-mode
show command-mode

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

do	Specifies executing an Enable mode command from within the active configuration mode. Any **show** command can be entered from any configuration mode as long as it is preceded by the **do** command.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Functional Notes

Since this command can be entered from anywhere in AOS, it has two variations. The **show command-mode** command can only be issued from within the Enable Configuration mode. The **do show command-mode** can only be entered from a configuration mode such as Global, or an interface configuration mode. The command mode is necessary information for setting specific privilege levels in AOS. For more information about privilege levels, refer to the command *privilege <mode> level <level> on page 1663* of this guide and the configuration guide *Configuring Privilege Levels in AOS CLI* available online at http://supportforums.adtran.com.

Usage Examples

The following example displays the current command mode from within the Enable mode where all **show** and **debug** commands are entered:

>**enable**
#show command-mode
Command mode is 'exec'

The following example displays the current command mode from within the Global Configuration mode where a majority of the configuration commands are entered that affect the AOS device on a global level:

>**enable**
#configuration terminal
(config)**#do show command-mode**
Command mode is 'config'

show community-list

Use the **show community-list** command to display any or all defined community lists in the router configuration. Variations of this command include:

show community-list
show community-list *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Specifies the name of the community list you wish to display. If this parameter is omitted, all defined community lists will be displayed.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran products.

Usage Examples

The following example shows two community lists, one of which permits all routes containing community number 10:67, and another which permits routes containing community number 10:68 and the Internet community number, but denies routes containing community number 10:45.

```
>enable
#show community-list
community-list CommList1:
 permit 10:67
community-list CommList2:
 permit 10:68 internet
 deny 10:45
```

show configuration

Use the **show configuration** command to display a text printout of the startup configuration file stored in nonvolatile random access memory (NVRAM).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show configuration** command:

```
>enable
#show configuration
!
!
no enable password
!
ip subnet-zero
ip classless
ip routing
!
event-history on
no logging forwarding
logging forwarding priority-level info

!
```

show connections

Use the **show connections** command to display information (including time division multiplexing (TDM) group assignments) for all active connections.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show connections** command:

```
>enable
#show connections
Displaying all connections....
```

Conn ID	From	To
1	atm 1	adsl 1/1
2	ppp 1	t1 2/1, tdm-group 1
3	ppp 1	t1 2/2, tdm-group 1
4	ppp 3	e1 3/1, tdm-group 1
5	ppp 3	e1 3/2, tdm-group 1
6	ppp 3	e1 3/3, tdm-group 1

show crypto ca

Use the **show crypto ca** command to display information regarding certificates and profiles. Variations of this command include:

show crypto ca certificates
show crypto ca crls
show crypto ca profiles

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

certificates	Displays information on all certificates.
crls	Displays a summary of all certificate revocation lists (CRLs) for each certificate authority (CA).
profiles	Displays information on all configured CA profiles.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced (enhanced software version only).
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show crypto ca certificates** command:

```
>enable
#show crypto ca certificates
CA Certificate
 Status: Available
 Certificate Serial Number: 012d
 Subject Name: /C=FI/O=SSH Communications Security/OU=Web test/CN=Test CA 1
 Issuer: /C=FI/O=SSH Communications Security/OU=Web test/CN=Test CA 1
 CRL Dist. Pt: /C=FI/O=SSH Communications Security/OU=Web test/CN=Test CA 1
 Start date is Jan 9 16:25:15 2003 GMT
 End date is Dec 31 23:59:59 2003 GMT
 Key Usage:
   Non-Repudiation
   Key Encipherment
   Data Encipherment
   CRL Signature
   Encipherment Only
```

show crypto ike

Use the **show crypto ike** command to display information regarding the Internet key exchange (IKE) configuration. Variations of this command include the following:

show crypto ike client configuration pool
show crypto ike client configuration pool *<name>*
show crypto ike policy
show crypto ike policy *<value>*
show crypto ike remote-id *<remote-id>*
show crypto ike sa
show crypto ike sa brief

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

client configuration pool	Displays the list of all configured IKE client configuration pools.
<name>	Optional. Displays detailed information regarding the specified IKE client configuration pool.
policy	Displays information on all IKE policies. Indicates if client configuration is enabled for the IKE policies and displays the pool names.
<value>	Optional. Displays detailed information on the specified IKE policy. This number is assigned using the **crypto ike policy** command. Refer to *crypto ike on page 1247* for more information.
remote-id *<remote-id>*	Displays information on all IKE information regarding the remote-id. The remote-id value is specified using the **crypto ike remote-id** command. Refer to *crypto ike remote-id on page 1251* for more information.
sa	Displays all Internet Protocol security (IPsec) security associations (SAs).
sa brief	Optional. Displays a brief listing of IPsec SAs.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 15.1	Command was expanded to include the **brief** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show crypto ike policy** command:

```
>enable
#show crypto ike policy
Crypto IKE Policy 100
 Main mode
 Using System Local ID Address
 Peers:
  63.105.15.129
initiate main
respond anymode
 Attributes:
    10
      Encryption: 3DES
      Hash: SHA
      Authentication: Pre-share
      Group: 1
      Lifetime: 900 seconds
```

The following is sample output from the **show crypto ike sa brief** command:

```
>enable
#show crypto ike sa brief
Using 3 SAs out of 2000
IKE Security Associations:

(NOTE: The Remote ID may be truncated)

Peer IP Address  Lifetime  Status           IKE Policy  Remote ID
10.22.19.4       19800     UP (SA_MATURE)   100         nv1224r
10.22.19.2       0         MM_SA_WAIT       101         UNKNOWN
10.22.19.6       86365     UP (SA_MATURE)   102         security2
```

show debugging

Use the **show debugging** command to display a list of all activated debug message categories. Variations of this command include:

show debugging
show debugging saved-filters

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

saved-filters	Optional. Displays the last debug filters saved using the command *debug save on page 450*.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.4	Command was expanded to include the **saved-filters** keyword.

Usage Examples

The following is sample output from the **show debugging** command:

```
>enable
#show debugging
debug ip access-list MatchAll
debug firewall
debug ip rip
debug frame-relay events
debug frame-relay llc2
debug frame-relay lmi
```

The following is sample output from the **show debugging saved-filters** command:

>**enable**
#show debugging saved-filters
Saved filters:
debug mail-client agent
debug probe test1

show demand

Use the **show demand** command to display information regarding demand routing parameters and statistics. Variations of this command include the following:

show demand
show demand interface demand <*interface*>
show demand resource pool
show demand resource pool <*name*>
show demand sessions

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface demand <*interface*>	Optional. Displays information for a specific demand routing interface. Valid range is **1** to **1024**. Type **show demand interface ?** for a list of valid interfaces.
resource pool	Optional. Displays all resource pool information.
<*name*>	Optional. Displays resource pool information for a specific resource pool name.
sessions	Optional. Displays active demand sessions.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show demand interface** command:

```
>enable
#show demand int 1
Demand 1 is UP (connected)
 Configuration:
   Keep-alive is set (10 sec.)
   Admin MTU = 1500
```

```
   Mode: Either, 1 dial entries, idleTime = 120, fastIdle = 20
   Resource pool demand
   No authentication configured
   IP address 10.100.0.2 255.255.255.0
 Connect Sequence: Successes = 0, Failures = 0
   Seq    DialString     Technology    Successes  Busys   NoAnswers    NoAuths    InUse
    5      5552222          ISDN            0        0          0           0
 Current values:
   Local IP address 10.100.0.2, Peer IP address 10.100.0.1
   Seconds until disconnect: 63
   Queueing method: weighted fair
   Output queue: 0/1/428/64/0 (size/highest/max total/threshold/drops)
     Conversations 0/1/256 (active/max active/max total)
     Available Bandwidth 48 kilobits/sec
   Bandwidth=64 Kbps
 Link through bri 1/3, Uptime 0:01:10

   Last callerID 2565552222, last called num 5552222
```

The following is sample output from the **show demand interface demand** command:

```
>enable
#show demand interface demand 1
demand 1
Idle timer (120 secs), Fast idle timer (20 secs)

Dialer state is data link layer up
Dial reason: answered

Interface bound to resource bri 1/3
Time until disconnect 105 secs
Current call connected 00:00:27
Connected to 2565552222

Number of active calls = 1
Interesting Traffic = list junk

 Connect Sequence: Successes = 0, Failures = 0
   Seq    DialString     Technology    Successes     Busys  NoAnswers    NoAuths    InUse
    5      5552222         ISDN0            0          0          0
```

The following is sample output from the **show demand resource pool** command:

```
>enable
#show demand resource pool
Pool demand
        Resources:          bri 1/3, bri 2/3
        Demand Interfaces:  demand 1
```

The following is sample output from the **show demand sessions** command:

```
>enable
#show demand sessions
Session 1
Interface demand 1
Local IP address = 10.100.0.2
Remote IP address = 10.100.0.1
Remote Username =
Dial reason: ip (s=, d=)
Link 1
 Dialed number = 5552222
 Resource interface = bri 1/3, Multilink not negotiated
 Connect time: 0:0:13
 Idle Timer: 119
```

show desktop-auditing dhcp

Use the **show desktop-auditing dhcp** command to display collected network access protection (NAP) and Dynamic Host Configuration Protocol (DHCP) information for clients connected to the network. The display of the collected information can be for all connected clients or for a specific client. Variations of this command include:

show desktop-auditing dhcp
show desktop-auditing dhcp antispyware 3rd-party
show desktop-auditing dhcp antispyware disabled
show desktop-auditing dhcp antispyware out-of-date
show desktop-auditing dhcp antispyware snoozed
show desktop-auditing dhcp antivirus 3rd-party
show desktop-auditing dhcp antivirus disabled
show desktop-auditing dhcp antivirus out-of-date
show desktop-auditing dhcp antivirus snoozed
show desktop-auditing dhcp auto-updates disabled
show desktop-auditing dhcp auto-updates not-checking
show desktop-auditing dhcp auto-updates not-downloading
show desktop-auditing dhcp auto-updates not-installing
show desktop-auditing dhcp brief
show desktop-auditing dhcp firewall 3rd-party
show desktop-auditing dhcp firewall disabled
show desktop-auditing dhcp firewall snoozed
show desktop-auditing dhcp hostname <*hostname*>
show desktop-auditing dhcp interface gigabit-switchport <*slot/port*>
show desktop-auditing dhcp ip <*ip address*>
show desktop-auditing dhcp local-violators
show desktop-auditing dhcp mac <*mac address*>
show desktop-auditing dhcp server-restricted
show desktop-auditing dhcp server-violators

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

antispyware	Optional. Displays NAP information only for clients with the specified antispyware status.
3rd-party	Displays NAP information only for clients with third-party antispyware.

disabled	Displays NAP information only for clients with disabled antispyware.
out-of-date	Displays NAP information only for clients with out-of-date antispyware.
snoozed	Displays NAP information only for clients with inactive antispyware.
antivirus	Optional. Displays NAP information only for clients with the specified antivirus status.
3rd-party	Displays NAP information only for clients with third-party antivirus software.
disabled	Displays NAP information only for clients with disabled antivirus software.
out-of-date	Displays NAP information only for clients with out-of-date antivirus software.
snoozed	Displays NAP information only for clients with inactive antivirus software.
auto-updates	Optional. Displays NAP information only for clients with the specified auto-update status.
disabled	Displays NAP information only for clients with disabled auto-updates.
not-checking	Displays NAP information only for clients that are not checking for auto-updates.
not-downloading	Displays NAP information only for clients that are not downloading auto-updates.
not-installing	Displays NAP information only for clients that are not installing auto-updates.
brief	Optional. Displays information for all NAP clients in a table format.
firewall	Optional. Displays NAP information only for clients with the specified firewall state.
3rd-party	Displays NAP information only for clients with third-party firewall software.
disabled	Displays NAP information only for clients with disabled firewall software.
snoozed	Displays NAP information only for clients with inactive firewall software is displayed.
hostname <*hostname*>	Optional. Displays NAP information only for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Displays NAP information only for the client using the specified interface.
ip <*ip address*>	Optional. Displays NAP information only for the client at the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

local-violators	Optional. Displays NAP information only for clients that violate the local policy.
mac <*mac address*>	Optional. Displays NAP information only for the client at the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
server-restricted	Optional. Displays NAP information only for the clients restricted by the server.
server-violators	Optional. Displays NAP information only for the clients that violate the server policy.

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.

Functional Notes

Output of the **show desktop-auditing dhcp** command can be limited by specific client or by specific criteria (feature states), but not by both.

Local policies are defined by using the command *desktop-auditing local-policy on page 1258*.

For more information about configuring local policies, refer to *Desktop Auditing Local Policy Command Set on page 4395*.

For more information about configuring desktop auditing, refer to the *Configuring Desktop Auditing in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show desktop-auditing dhcp** command:

```
#show desktop-auditing dhcp
Client MAC/IP: 00:E0:29:0E:D5:E3 / 10.23.220.1 / xpsp3-host
    Collected: DHCP
    VLAN ID: 100
    Source Port: gigabit-switchport 0/2
    Date/Time Collected: 2009.08.25 10:33:42
    Client NAP: Enabled
    Server NAP: Enabled
    Client OS Version: Windows XP
    Client OS Service Pack: 3
    Client Processor Architecture: x86 architecture
    Client Firewall:  Microsoft
                      Disabled but Up-To-Date
    Client Antivirus: Symantec Antivirus Corporate Edition
```

```
                    Enabled & Up-To-Date
  Client Antispyware: None Installed
  Client Automatic Security Updates: Enabled, Download, but Don't Install
  Client Security Updates: From 10.10.10.3
                           Up-To-Date (2009.08.25 10:33:42)
  Client Requires Remediation: False
  Network Connectivity: Not restricted
```

The preceding output is for one client. This same information will be displayed for all connected clients unless one of the filtering parameters is used in conjunction with the ***show desktop-auditing dhcp*** *command.*

The following is sample output from the **show desktop-auditing dhcp brief** command. Because of the **brief** keyword, the results are displayed in table format.

#show desktop-auditing dhcp brief

```
Columns:          E = Enabled, U = Up-to-date, 3 = 3rd party (not MS), S = Snoozed
                  C = Check for Updates, D = Download Updates, I = Install Updates
                  ! = Error (not installed, other)
Indicators:       + = True, - = False, ? = Unknown State
                  ! = Attention
Server
Response          R = Client Requires Remediation, N = Client Network Restricted
Codes:            . = No Server Response

```

show dial-backup interfaces

Use the **show dial-backup interfaces** command to display all configured dial-backup interfaces and the associated parameters for each.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 5.1	Command was expanded to include the Point-to-Point Protocol (PPP) dial backup.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example enters the Enable mode and uses the show command to display dial-backup interface information:

```
>enable
#show dial-backup interfaces
Dial-backup interfaces...
fr 1.16 backup interface:
 Backup state: idle
 Backup protocol: PPP
Call mode: originate
 Auto-backup: enabled
 Auto-restore: enabled
 Priority: 50
 Backup delay: 10 seconds
 Restore delay: 10 seconds
 Connect timeout: 60 seconds
--MORE--
```

show dialin interfaces

Use the **show dialin interfaces** command to display information regarding remote console dialin.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show dialin interfaces** command:

```
>enable
#show dialin interfaces
Dialin interfaces...
modem 1/3 dialin interface:
 Connection Status: Connected
Caller ID info: name-John Smith number-5551212 time-14:23:10 2/17/2003
```

show dos counters

Use the **show dos counters** command to display denial of service (DoS) attack statistics.

Syntax Description

No subcommands.

Default Values

By default, DoS protection in AOS is disabled.

Command History

Release 17.7	Command was introduced.

Usage Examples

The following example displays attack statistics for the AOS unit:

```
>enable
#show dos counters
DOS Fragment Error 0
DOS ICMP Error 0
DOS L3 Header Error 0
DOS L4 Header Error 1269620
DOS Source MAC equal Destination MAC  0
#
```

show dos-id

Use the **show dos-id** command to list all denial of service (DoS) attacks the DoS protection feature provides protection against, along with their corresponding threat IDs.

Syntax Description

No subcommands.

Default Values

By default, DoS protection in AOS is disabled.

Command History

Release 17.7	Command was introduced.

Functional Notes

The IDs obtained with the **show dos-id** command are used in the **dos-protection** <*id*> command to add or remove threat protection for specific threats.

Usage Examples

The following is sample output for this command:

```
>enable
#show dos-id
DOS L4 Header Error
  TCP pkts w/ control flags and seq# equal to 0                    [1]
  TCP pkts w/ SYN and FIN bits set                                 [2]
  TCP pkts w/ FIN,URG,PSH bits set with ACK bit & seq# equal to 0  [3]
  TCP pkts w/ source port equal to destination port                [4]
  UDP pkts w/ source port equal to destination port                [5]
  TCP SYN pkts w/source port 0-1023 for the first fragment         [6]

DOS L3 Header Error
  Source IP equal to Destination IP                                [20]

DOS ICMP Error
  Fragmented ICMP pkts                                             [40]
  ICMPV4 ping pkts w/payload greater than specified                [41]
  ICMPV6 ping pkts w/payload greater than specified                [42]

DOS Fragment Error
  TCP fragments w/ offset value set to 1                           [60]
  First TCP fragments w/ TCP header smaller than specified         [61]
#
```

show dot11 access-point

Use the **show dot11 access-point** command to display information about wireless access points (APs) for the wireless access controllers (ACs) in the network. Variations of this command include the following:

show dot11 access-point
show dot11 access-point detail
show dot11 access-point mac-address <*mac address*>
show dot11 access-point mac-address <*mac address*> **detail**
show dot11 access-point managed
show dot11 access-point managed detail
show dot11 access-point managed realtime
show dot11 access-point name <*name*>
show dot11 access-point name <*name*> **detail**
show dot11 access-point realtime
show dot11 access-point status available
show dot11 access-point status available detail
show dot11 access-point status download
show dot11 access-point status download detail
show dot11 access-point status init
show dot11 access-point status init detail
show dot11 access-point status no_session
show dot11 access-point status no_session detail
show dot11 access-point status ready
show dot11 access-point status ready detail
show dot11 access-point status recovery
show dot11 access-point status recovery detail
show dot11 access-point status running
show dot11 access-point status running detail
show dot11 access-point status session
show dot11 access-point status session detail
show dot11 access-point unmanaged
show dot11 access-point unmanaged detail
show dot11 access-point unmanaged realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

> NOTE *Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

mac-address <*mac address*>	Optional. Displays a particular access point (AP) by medium access control (MAC) address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
managed	Optional. Displays a list of APs managed by this AC.
name <*name*>	Optional. Displays a particular AP by name.
status	Optional. Displays APs at a certain status. (Refer to the options below.)
available	Optional. Displays APs at available session state.
download	Optional. Displays APs at download state.
init	Optional. Displays APs at init state.
no_session	Optional. Displays APs at no session state.
ready	Optional. Displays APs at ready state.
recovery	Optional. Displays APs at recovery state.
running	Optional. Displays APs at running state.
session	Optional. Displays APs at session state.
unmanaged	Optional. Displays a list of APs not managed by this AC.
detail	Optional. Displays a detailed list of all discovered APs.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 16.1	Command was expanded to include the available session state.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show dot11 access-point** command:

>**enable**
#show dot11 access-point
Wireless Access Points:

Name	MAC-Address	AP Status	Cfg'd	Control Status
ADTN1DF857	00:A0:C8:1D:F8:57	Session	Y	Ctl_by_This_AC

show dot11 clients

Use the **show dot11 clients** command to display stations associated with all wireless access points (APs). Variations of this command include the following:

show dot11 clients interface dot11ap *<ap interface>*
show dot11 clients mac-address *<mac address>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

interface dot11ap	Displays stations associated with APs by interface.
<ap interface>	Specifies AP interface number. Range is **1** to **8**.
mac-address	Displays stations associated with APs by medium access control (MAC) address.
<mac address>	Specifies a valid client 48-bit MAC address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following command initiates a request to display a list of clients for AP interface 1.

```
>enable
#show dot11 clients interface dot11ap 1
Wireless Access Point Clients:
 Ap        Station MAC-Address
 ------    -------------------
  1        00:40:96:AB:3B:5E
```

The following command initiates a request to display a list of clients for MAC address 00:40:96:ab:3b:5e:

>**enable**
#show dot11 clients mac-address 00:40:96:ab:3b:5e
Wireless Access Point Clients:

Ap	Radio	Vap	Station MAC-Address
1	1	1	00:40:96:AB:3B:5E

show dot11 statistics interface dot11ap

Use the **show dot11 statistics interface dot11ap** command to display counters of an 802.11 radio and its virtual access points (VAPs). Variations of this command include the following:

show dot11 statistics interface dot11ap *<ap/radio>*
show dot11 statistics interface dot11ap *<ap/radio.vap>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<ap>	Specifies the wireless access point (AP). Range is **1** to **8**.
</radio>	Specifies the radio associated with the AP. Range is **1** to **2**.
<.vap>	Specifies the VAP associated with the radio. Range is **1** to **8**.

> *The radio must be specified in the format <ap/radio>. For example, **2/1** indicates radio 1 on access point 2. The VAP must be specified in the format <ap/radio.vap>. For example, **2/1.1** indicates virtual access point 1 on radio 1 on access point 2.*

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output for the radio 1 on AP interface 1 using the **show dot11 statistics interface dot11ap** command:

```
>enable
#show dot11 statistics interface dot11ap 1/1
Authentication Count: 17
 Deauthentication Count: 48
 Association Count: 18
 Disassociation Count: 12
 Reassociation Count: 0
 Wireless MSDU Rx Packets: 346
 Wireless Data Rx Packets: 7221
 Wireless Multicast Rx Packets: 308
 Wireless Management Rx Packets: 675805
 Wireless Control Rx Packets: 0
 Wireless MSDU Tx Packets: 237259
 Wireless Data Tx Packets: 236856
 Wireless Multicast Tx Packets: 236812
 Wireless Management Tx Packets: 599
 Wireless Control Tx Packets: 0
```

show dns resolver queue

Use the **show dns resolver queue** command to show information related to the domain naming system (DNS) queries that are currently scheduled for resolution.Variations of this command include:

show dns resolver queue
show dns resolver queue realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release R11.6.0	Command was introduced.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C)**. If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following command shows real time information related to DNS queries currently scheduled for resolution:

>enable
#show dns resolver queue realtime

show dynamic-dns

Use the **show dynamic-dns** command to show information related to the dynamic domain naming system (DNS) configuration.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from this command:

```
>enable
#show dynamic-dns
eth 0/1:
 Hostname: host
 Is Updated: no
 Last Registered IP: 10.15.221.33
 Last Update Time: 00:00:00 UTC Thu Jan 01 1970
```

show dynamic-counter

Use the **show dynamic-counter** command to show statistics related to the dynamic counter. Variations of this command include:

show dynamic-counter
show dynamic-counter average-rates
show dynamic-counter <*slot/index*>

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

average-rates	Displays the average rate of frames/packets per second and bits per second assigned to a queue for the last 30 seconds and 5 minutes.
<*slot/index*>	Specifies the slot and port of the dynamic counter in the format <*slot/index*>. For example, **0/1**.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.
Release R13.3.0	Command was expanded to include the **average-rates** parameter.

Usage Examples

The following is sample output from this command:

>enable
#show dynamic-counter

Counter	Type	Port/Queue	Bytes	Packets	Avg Rate (kbps)	Status
0/1	TX	Gig Eth 1/Q 4	74984320	1171630	5	ACTIVE
0/2	CONGEST	Gig Eth 1/Q 4	0	0	0	ACTIVE
0/3	TX	Gig Eth 1/Q 3	75062016	1172844	6	ACTIVE
0/4	CONGEST	Gig Eth 1/Q 3	0	0	0	ACTIVE

...
```

show eps

Use the **show eps** command to show information related to the external power supply (EPS) power state. The output of this command indicates if an EPS is connected, if it is delivering power, the available power, and whether the EPS has failed.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.8.0	Command was introduced.

Usage Examples

The following is sample output from this command:

```
>enable
#show eps
VCID 1 EPS is connected
VCID 1 EPS is delivering 370 watts
VCID 1 EPS fans are working.
VCID 2 EPS is connected
VCID 2 EPS is delivering 370 watts
VCID 2 EPS fans are working.
```

show ethernet cfm association

Use the **show ethernet cfm association** command to display Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance association (MA) configuration and statistical information. Variations of this command include:

show ethernet cfm association
show ethernet cfm association *<domain name>*
show ethernet cfm association *<domain name>* *<association name>*
show ethernet cfm association *<domain name>* *<association name>* **detail**
show ethernet cfm association detail
show ethernet cfm association none *<association name>*
show ethernet cfm association none *<association name>* **detail**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<domain name>	Optional. Specifies that output is limited to associations in the specified domain.
<association name>	Optional. Specifies that output is limited to the specified association.
detail	Optional. Specifies the output is displayed in detail, rather than summary, format.
none	Optional. Specifies that no domain name is used.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show ethernet cfm association** command:

```
>enable
#show ethernet cfm association
---------------------------------------------------------------------------------------------------------------------
Index       Domain/Association                                  CCM     MEP-Cnt
                  Component   VID    Sender-ID
---------------------------------------------------------------------------------------------------------------------
1           Bogus/Test                                          1sec        0
1           BenchTest/BenchAssoc                                1min        3
                  giga-eth      0/2 0      none
```

The following is sample output from the **show ethernet cfm association detail** command:

```
>enable
#show ethernet cfm association detail
Domain Name: Bogus
Assoc Name: Test
  SNMP Index: 1
  CCM Interval: 1sec
  Components:
  MEP Count: 0

Domain Name: BenchTest
Assoc Name: BenchAssoc
  SNMP Index: 1
  CCM Interval: 1min
  Components:
    giga-eth 0/2 (VLAN=0, ID=none)
  MEP Count: 3
    1 (remote)
    2 (remote)
    3 (local)
```

show ethernet cfm domain

Use the **show ethernet cfm domain** command to display Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance domain (MD) configuration and statistical information. Variations of this command include:

show ethernet cfm domain
show ethernet cfm domain <*domain name*>
show ethernet cfm domain <*domain name*> **detail**
show ethernet cfm domain detail
show ethernet cfm domain none

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*domain name*>	Optional. Specifies that output is limited to associations in the specified domain.
detail	Optional. Specifies the output is displayed in detail, rather than summary, format.
none	Optional. Specifies that no domain name is used.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show ethernet cfm domain** command:

```
>enable
#show ethernet cfm domain
---------------------------------------------------------------------------------------------
Index  Domain                                Lvl          Assoc-Count
---------------------------------------------------------------------------------------------
1      Bogus                                 5            1
2      BenchTest                             5            1
```

The following is sample output from the **show ethernet cfm domain detail** command:

```
>enable
#show ethernet cfm domain detail
Domain Name: Bogus
 SNMP Index:   1
 Level:        5
 Associations: 1
    test

Domain Name: BenchTest
 SNMP Index:   2
 Level:        5
 Associations: 1
    BenchAssoc
```

show ethernet cfm mep local

Use the **show ethernet cfm mep local** command to display configuration and statistical information for all Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoints (MEPs) configured on the system. Variations of this command include:

show ethernet cfm mep local
show ethernet cfm mep local detail
show ethernet cfm mep local domain *<domain name>* **association** *<association name>*
show ethernet cfm mep local fault
show ethernet cfm mep local interface *<interface>*
show ethernet cfm mep local mep-id *<mep id>*
show ethernet cfm mep local statistics

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Specifies the format is in detail, rather than summary, format.
domain *<domain name>*	Optional. Specifies that output is limited to MEPs in the specified domain.
association *<association name>*	Optional. Specifies that output is limited to MEPs in the specified association.
fault	Optional. Specifies that output is limited to only MEP fault information.
interface *<interface>*	Optional. Specifies that output is limited to the MEPs configured on the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id. subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
mep-id *<mep id>*	Optional. Specifies that output is limited to MEPs with the specified ID. MEP ID range is **1** to **8191**.
statistics	Optional. Specifies that only MEP statistics are displayed.

Default Values

No default values are necessary for this command.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show ethernet cfm mep local detail** command:

```
>enable
#show ethernet cfm mep local detail
MEPs configured on this device

MEP-ID:       3
Domain/Assoc: BenchTest/Test
Mac Address:  00:A0:C9:00:D8:B2  Interface: giga-eth 0/2  Vlan:    0

show ethernet cfm mep remote

Use the **show ethernet cfm mep remote** command to display configuration and statistical information for all remote Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoints (MEPs) stored on the system. Variations of this command include:

show ethernet cfm mep remote
show ethernet cfm mep remote domain <*domain name*> **association** <*association name*>
show ethernet cfm mep remote domain none association <*association name*>
show ethernet cfm mep remote interface <*interface*>
show ethernet cfm mep remote level <*level*>
show ethernet cfm mep remote local-mep <*mep id*>
show ethernet cfm mep remote remote-mep <*mep id*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

domain <*domain name*>	Optional. Specifies that output is limited to MEPs in the specified domain.
none	Optional. Specifies no domain name is used.
association <*association name*>	Optional. Specifies that output is limited to MEPs in the specified association.
interface <*interface*>	Optional. Specifies that output is limited to the MEPs configured on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.
level <*level*>	Optional. Specifies that output is limited to MEPs in the specified maintenance level. Levels range from **0** to **7**.
local-mep <*mep id*>	Optional. Specifies that output is limited to the remote MEPs for all local MEPs with the specified ID. MEP ID range is **1** to **8191**.
remote-mep <*mep id*>	Optional. Specifies that output is limited to the remote MEPs with the specified ID. MEP ID range is **1** to **8191**.

Default Values

By default, all remote MEPs for all local MEPs are displayed.

By default, MEPs in all levels are displayed.

By default, all remote MEPs are displayed.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show ethernet cfm mep remote** command:

```
>enable
#show ethernet cfm mep remote
Local MEP 3
 Domain/Assoc: BenchTest/BenchAssoc
 Level: 5   VLAN: 0
 Interface: giga-eth 0/2
 Remote MEPs: (* = static)

   ID    State  Age       MAC                       RDI  Port     Iface
  ------------------------------------------------------------------------------------------------------------
 * 1     Ok     165936    00:A0:C8:1F:CE:B0          -   No TLV   Up
 * 2     Ok     165936    00:A0:C8:00:62:F2          -   No TLV   Up
```

show ethernet cfm stack

Use the **show ethernet cfm stack** command to display statistics and information about the Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) stack. Variations of this command include:

show ethernet cfm stack
show ethernet cfm stack interface *<interface>*
show ethernet cfm stack level *<level>*
show ethernet cfm stack vlan *<vlan id>*
show ethernet cfm stack vlan none

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface *<interface>*	Optional. Specifies that output is limited to the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id. subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
level *<level>*	Optional. Specifies that output is limited a specified maintenance level. Levels range from **0** to **7**.
vlan *<vlan id>*	Optional. Specifies that output is limited to a specific virtual local area network (VLAN). VLAN ID range is **1** to **4095**.
none	Optional. Specifies that output is limited to all VLANs.

Default Values

By default, all interfaces are displayed.

By default, all maintenance levels are displayed.

By default, all VLANs are displayed.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following is sample output from the **show ethernet cfm stack** command:

```
>enable
#show ethernet cfm stack
0-----------1-------------2-------------3-------------4-------------5-------------6-----------7-------------8
12345678901234567890123456789012345678901234567890123456789012345678901234567890
-------------------------------------------------------------------------------------------------------------------------
Interface     Vlan      Lvl       Domain/Assoc
                          MEPID          MAC
-------------------------------------------------------------------------------------------------------------------------
eth 0/1       0         7         Domain_1/MA_1
                          1              00:A0:C8:16:96:0D
eth 0/2       20        5         Domain1/Assoc2
                          2012           00:0a:c8:00:01:03
```

show ethernet lmi

Use the **show ethernet lmi** command to display Ethernet local management interface (E-LMI) statistics and configuration information. Variations of this command include:

show ethernet lmi current
show ethernet lmi current *<interface>*
show ethernet lmi statistics
show ethernet lmi statistics *<interface>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

current	Specifies the current status of EVCs that will be sent out with the next E-LMI message are displayed.
statistics	Specifies the E-LMI statistics are displayed.
<interface>	Optional. Limits output to a specified E-LMI interface. Specify interfaces in the format *<interface type [slot/port]>*. For example, for a Gigabit Ethernet interface, use **gigabit eth 0/1**. Type **show ethernet lmi statistics ?** for a complete list of interfaces.

Default Values

No default values are necessary for this command.

Command History

Release R11.5.0	Command was introduced.
Release R11.6.0	Command was expanded to include the **current** parameter.
Release R13.11.0	The output of this command was expanded to include ELMI forwarding status.

Usage Examples

The following example displays E-LMI statistics for the Gigabit Ethernet interface:

```
>enable
#show ethernet lmi statistics gigabit-ethernet 0/1
E-LMI Statistics for giga-eth 0/1
E-LMI Admin Status: Up
E-LMI Operation Status: Up
```

```
E-LMI Forwarding Status: Enabled
    UNI ID: giga-eth 0/1
    Reliability Errors:          0
Status Inquiry Timeouts:         0
Invalid Sequence Number:         0
Invalid Status Request:          0
Protocol Errors:                 0
Short Message:                   0
Invalid Version:                 0
Invalid Message Type:            0
Invalid Mandatory IE:            0
Mandatory IE Missing:            0
Out of Sequence IE:              0
Duplicated IE:                   0
Mandatory IE Missing:            0
Unexpected Recognized IE:        0

Last Full Status Inquiry Received:          00:50:35
Last Full Status Sent:                      00:50:35
Last Status Check Inquiry Received:         00:00:06
Last Status Check Sent:                     00:00:06
Last clearing of counters:                  never
```

show ethernet loopback

Use the **show ethernet loopback** command to display the status and ouput of facility or terminal loopback objects. Facility loopback objects are used to provision facility media access control (MAC) swap loopback tests and terminal loopback objects are used to provision Carrier Ethernet Terminal Loopback tests. Variations of this command include:

show ethernet loopback facility
show ethernet loopback facility *<name> <slot>*
show ethernet loopback facility slot *<slot>*
show ethernet loopback terminal
show ethernet loopback terminal *<name> <slot>*
show ethernet loopback terminal slot *<slot>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

facility	Specifies the output is for facility loopback objects.
terminal	Specifies the output is for terminal loopback objects.
<name>	Optional. Specifies that output is limited to the facility or terminal loopback object with the specified name.
<slot>	Optional. Specifies that output is limited to the facility or terminal loopback object with the specified slot.
slot *<slot>*	Optional. Specifies that output is limited to all facility or terminal loopback objects on a specified slot.

Default Values

By default, the status and output of all facility or terminal loopback objects are displayed.

Command History

Release R11.1.0	Command was introduced.
Release R13.7.0	Command was expanded to include the **terminal** loopback parameter.

Functional Notes

For more information regarding facility loopback objects and facility MAC swap loopback, refer to *Facility MAC Swap Loopback Command Set on page 3742*.

For more information regarding Carrier Ethernet Terminal Loopback objects, refer to *Carrier Ethernet Terminal Loopback Command Set on page 3739*.

Usage Examples

The following is sample output from the **show ethernet loopback facility** command:

>**enable**
#show ethernet loopback facility FACILITY 0

eth-lbk-fac “FACILITY” 0 is Enabled and Running
Matched S-tag : 100
Matched P-bit : na
Matched MAC : DA 00:A0:C8:00:00:01
System MAC : false
Interface : Gigabit Ethernet 0/1

show ethernet oam

Use the **show ethernet oam** command to display local and remote configuration and statistical information for Ethernet Link operations, administration, and maintenance (OAM) parameters stored on the system. Variations of this command include:

show ethernet oam discovery
show ethernet oam discovery interface *<interface>*
show ethernet oam statistics
show ethernet oam statistics interface *<interface>*
show ethernet oam status
show ethernet oam status interface *<interface>*
show ethernet oam summary

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

discovery	Displays discovery state information between the local OAM client and the remote peer. If no interface is specified, then information about all interfaces with Ethernet Link OAM enabled is displayed.
statistics	Displays Ethernet Link OAM Protocol Data Unit (PDU) counters by type, critical link fault records, and link-monitor event logs on a per-interface basis. If no interface is specified, then PDU information for all interface with Ethernet Link OAM enabled is displayed.
status	Displays the configured Ethernet Link OAM settings, including link-monitor settings, on a per-interface basis. If no interface is specified, then configuration for all interfaces with Ethernet Link OAM enabled is displayed.
summary	Displays a summary of the remote peer's configuration and capabilities for all interfaces that have Ethernet Link OAM enabled.
interface *<interface>*	Optional. Specifies that output is limited to the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id. subinterface id]>*. For example, for a Gigabit Ethernet interface, use **giga-eth 0/1**. For an Ethernet in the first mile (EFM) group, use **efm-group 1/1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

The following is sample output from the **show ethernet oam summary** command:

```
>enable
#show ethernet oam summary
Capability codes: L - Link Monitor, R- Remote Loopback
U - Unidirection, V - Variable Retrieval

Local           Remote
Interface       MAC Address       OUI      Mode      Capability
giga-eth 0/1    00:a0:c8:01:02:03 00A0C8   active    L V
```

The following is sample output from the **show ethernet oam discovery** command:

```
>enable
#show ethernet oam discovery
giga-eth 0/1

    Local Client
    ----------------
    Administrative configurations:
        Mode: active
        Unidirection: not supported

    Link monitor: supported
    Remote loopback: not supported
    MIB retrieval: supported
    Mtu size: 1518

Operational status:
    Stable: true
    State valid: true
```

show ethernet y1731 file-save

Use the **show ethernet y1731 file-save** command to display a specified Y.1731 performance monitoring log file. Variations of this command include:

show ethernet y1731 file-save *<filename>*
show ethernet y1731 file-save current frame-delay two-way
show ethernet y1731 file-save current frame-loss single-ended
show ethernet y1731 file-save current frame-loss synthetic single-ended

Syntax Description

<filename>	Specifies the filename of the file to be displayed.
current	Specifies that the current file of the specified type should be displayed.
current frame-delay two-way	Specifies that the current frame-delay two-way (ETH-DM) log file should be displayed.
current frame-loss single-ended	Specifies that the current single-ended frame-loss (ETH-LM) log file should be displayed.
current frame-loss synthetic single-ended	Specifies that the current single-ended synthetic frame-loss (ETH-SLM) log file should be displayed.

Default Values

No default values are necessary for this command.

Command History

Release 11.6.0	Command was introduced.

Usage Examples

The following example displays the contents of the current ETH-LM log file:

(config)**#show ethernet y1731 file-save current frame-loss single-ended**
Current LM Session Data:

Single-Ended Loss Measurement Data Set
Fileformat Version: 1.02
EVC.Name |EVC.VLAN-ID|EVC.PCP|Device.Serial|Dest.MAC|LM.period|LM.TestID|LM.Suspect|
LM.Start_ToD|LM.End_ToD|LM.PDU-sent|LM.PDU-received|LM.Forward.TX.framecount|LM.Forward.RX.f
ramecount|LM.Backward.TX.framecount|LM.Backward.RX.framecount

show ethernet y1731 linktrace-cache

Use the **show ethernet y1731 linktrace-cache** command to display information for the Ethernet operations, administration, and maintenance (OAM) over Y.1731 linktrace cache.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display Ethernet OAM CFM over Y.1731 linktrace cache information:

>enable
#show ethernet y1731 linktrace-cache

show ethernet y1731 meg

Use the **show ethernet y1731 meg** command to display information for the Ethernet operations, administration, and maintenance (OAM) over Y.1731 maintenance entity group (MEG). Variations of this command include:

show ethernet y1731 meg
show ethernet y1731 meg char-string <*string*>
show ethernet y1731 meg icc-umc <*string*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

char-string <*string*>	Optional. Displays information for a MEG specified using a character string.
icc-umc <*string*>	Optional. Displays information for MEG specified using an ITU-Carrier Code Unique MEG ID Code (ICC-UMC).

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display information about all configured MEGs:

```
>enable
#show ethernet y1731 meg
```

show ethernet y1731 mep local

Use the **show ethernet y1731 mep local** command to display configuration and statistical information for all local Ethernet operations, administration, and maintenance (OAM) over Y.1731 maintenance endpoints (MEPs) configured on the system. Variations of this command include:

show ethernet y1731 mep local
show ethernet y1731 mep local detail
show ethernet y1731 mep local down
show ethernet y1731 mep local down statistics
show ethernet y1731 mep local interface <*interface*>
show ethernet y1731 mep local interface <*interface*> **statistics**
show ethernet y1731 mep local level <*level*>
show ethernet y1731 mep local level <*level*> **statistics**
show ethernet y1731 mep local meg char-string <*string*>
show ethernet y1731 mep local meg icc-umc <*string*>
show ethernet y1731 mep local mep-id <*id*>
show ethernet y1731 mep local mep-id <*id*> **statistics**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays information in detailed, rather than summary, format.
down	Optional. Displays the output limited to downstream MEPs.
interface <*interface*>	Optional. Displays the output limited to the MEPs configured on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
level <*level*>	Optional. Displays the output limited to MEPs with the specified level. Valid range is **0** to **7**.
meg char-string <*string*>	Optional. Displays the output limited to the maintenance entity group (MEG) specified with a character string.
meg icc-umc <*string*>	Optional. Displays the output limited to the MEG specified with an ITU-Carrier Code Unique MEG ID Code (ICC-UMC).
mep-id <*mep id*>	Optional. Displays the output limited to MEPs with the specified ID. MEP ID range is **1** to **8191**.
statistics	Optional. Displays only MEP statistics.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display information for all configured local MEPs:

```
>enable
#show ethernet y1731 mep local
```

show ethernet y1731 mep remote

Use the **show ethernet y1731 mep remote** command to display configuration and statistical information for all remote Ethernet operations, administration, and maintenance (OAM) over Y.1731 maintenance endpoints (MEPs) configured on the system. Variations of this command include:

show ethernet y1731 mep remote
show ethernet y1731 mep remote detail
show ethernet y1731 mep remote down
show ethernet y1731 mep remote down statistics
show ethernet y1731 mep remote interface <*interface*>
show ethernet y1731 mep remote interface <*interface*> **statistics**
show ethernet y1731 mep remote level <*level*>
show ethernet y1731 mep remote level <*level*> **statistics**
show ethernet y1731 mep remote meg char-string <*string*>
show ethernet y1731 mep remote meg icc-umc <*string*>
show ethernet y1731 mep remote mep-id <*id*>
show ethernet y1731 mep remote mep-id <*id*> **statistics**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays information in detailed, rather than summary, format.
down	Optional. Displays the output limited to downstream MEPs.
interface <*interface*>	Optional. Displays the output limited to the MEPs configured on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id. subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
level <*level*>	Optional. Displays the output limited to MEPs with the specified level. Valid range is **0** to **7**.
meg char-string <*string*>	Optional. Displays the output limited to the maintenance entity group (MEG) specified with a character string.
meg icc-umc <*string*>	Optional. Displays the output limited to the MEG specified with an ITU-Carrier Code Unique MEG ID Code (ICC-UMC).
mep-id <*mep id*>	Optional. Displays the output limited to MEPs with the specified ID. MEP ID range is **1** to **8191**.
statistics	Optional. Displays only MEP statistics.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display information for all configured remote MEPs:

>**enable**
#show ethernet y1731 mep remote

show ethernet y1731 stack

Use the **show ethernet y1731 stack** command to display statistics and information about the Ethernet operations, administration, and maintenance (OAM) over Y.1731 stack. Variations of this command include:

show ethernet y1731 stack
show ethernet y1731 stack interface *<interface>*
show ethernet y1731 stack level *<level>*
show ethernet y1731 stack vlan *<vlan id>*
show ethernet y1731 stack vlan none

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface *<interface>*	Optional. Displays the output limited to the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id. subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interface, enter **interface ?** at the prompt.
level *<level>*	Optional. Displays the output limited to the specified maintenance level. Levels range from **0** to **7**.
vlan *<vlan id>*	Optional. Displays the output limited to the specified virtual local area network (VLAN). VLAN ID range is **1** to **4095**.
none	Optional. Displays no output for VLANs.

Default Values

By default, all interfaces are displayed.

By default, all maintenance levels are displayed.

By default, all VLANs are displayed.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to view all Ethernet OAM Y.1731 stack information:

>**enable**
#show ethernet y1731 stack

show evc

Use the **show evc** command to display configuration information for Ethernet virtual connections (EVCs) and EVC maps. Variations of this command include:

show evc
show evc <*name*>
show evc <*name*> **counters**
show evc <*name*> **counters** <*queue*>
show evc <*name*> **counters** <*queue*> **performance-statistics 15-minute**
show evc <*name*> **counters** <*queue*> **performance-statistics 15-minute** <*value*>
show evc <*name*> **counters** <*queue*> **performance-statistics 24-hour**
show evc <*name*> **counters** <*queue*> **performance-statistics 24-hour** <*value*>
show evc <*name*> **counters performance-statistics 15-minute**
show evc <*name*> **counters performance-statistics 15-minute** <*value*>
show evc <*name*> **counters performance-statistics 24-hour**
show evc <*name*> **counters performance-statistics 24-hour** <*value*>
show evc-map
show evc-map <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

evc <*name*>	Optional. Specifies that information for a specific EVC is displayed. If no name is specified, information for all EVCs is displayed.
evc-map <*name*>	Optional. Specifies that information for a specific EVC map is displayed. If no name is specified, information for all EVC maps is displayed.
counters	Optional. Displays Metro Ethernet Forum (MEF) counters for the specified EVC.
counters <*queue*>	Optional. Displays MEF counters for the specified queue number on the MEN port associated with the EVC. Valid entry for <*queue*> is **0** through **7**.
performance-statistics	Optional. Displays aggregate performance statistics.
15-minute	Optional. Displays the statistics for a 15-minute period in the last 24 hours.
24-hour	Optional. Displays the statistics for a 24-hour period in the last 7 days.
<*value*>	Optional. Specifies which 15-minute period in the last 24 hours or which 24-hour period in the last 7 days is displayed. Range for 15-minute periods is **1** to **96**; range for 24-hour periods is **1** to **7**.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.
Release R11.5.0	Command was expanded to include **counters** and **performance-statistics** parameters.
Release R13.11.0	Output of the **show evc** <*name*> **counters** command was changed to include ingress and egress Layer 2 bytes collected on both the UNI and NNI interfaces and displayed on a per-EVC and per-CoS (queue) basis. UNI and NNI Layer 2 bytes are displayed in **Total Egress Bytes** and **Total Ingress Bytes** output lines beneath the aggregate counters for the EVC or CoS queue. In addition, **Ingress Red Bytes** and **Ingress Yellow Discard Bytes** have also been included in the command output.

Usage Examples

The following is sample output from the command to display information for all configured EVCs:

```
>enable
#show evc
All EVC Tags Available in MEN
EVC evc1
    S-TAG                    : --
    Admin State              : Disabled
    EVC Status               : Not Running - Disabled
    CE-VLAN Preservation     : Enabled
```

The following example displays 15-minute interval performance statistics for **EVC-200** in queue 1:

```
# show evc EVC-200 counters 0 performance-statistics 15-minute 1
EVC-200 Queue 0 15-Minute PM (1)
07:00
  Ingress Green Frames           :  0
  Ingress Green Bytes            :  0
  Ingress Green Discard Frames   :  0
  Ingress Green Discard Bytes    :  0
  Egress Green Frames            :  0
  Egress Green Bytes             :  0
  Egress Green Discard Frames    :  0
  Egress Green Discard Bytes     :  0
```

show event-history

Use the **show event-history** command to display all entries in the current local event-history log.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The event history provides useful information regarding the status of the system and individual port states. Use the event history as a troubleshooting tool when identifying system issues. The following is sample output from the event-history log.

```
>enable
#show event-history
Using 526 bytes
2002.07.12 15:34:01 T1.t1 1/1 Yellow
2002.07.12 15:34:01 INTERFACE_STATUS.t1 1/1 changed state to down.
2002.07.12 15:34:02 T1.t1 1/1 No Alarms
2002.07.12 15:34:02 INTERFACE_STATUS.t1 1/1 changed state to up.
2002.07.12 15:34:03 INTERFACE_STATUS.eth 0/1 changed state to up.
2002.07.12 15:34:10 OPERATING_SYSTEM Warm Start
2002.07.12 15:34:12 PPP.NEGOTIATION LCP up
2002.07.12 15:34:12 PPP.NEGOTIATION IPCP up
```

show fan-tach

Use the **show fan-tach** command to view the unit's current fan speed.

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows the current fan speed on an AOS device with two chassis fans:

```
>enable
#show fan-tach
Fan Tach (in Percent)    %
Chassis Fan 1            45
Chassis Fan 2            45
```

The following example shows the current fan speed on an AOS device with one central fan:

```
>enable
#show fan-tach
Fan Tach (in Percent)    %
Central Fan              59
```

show file

Use the **show file** command to display a specified file to the terminal screen. Variations of this command include:

show file *<filename>*
show file *<filename>* **checksum**
show file cflash *<filename>*
show file cflash *<filename>* **checksum**
show file flash *<filename>*
show file flash *<filename>* **checksum**
show file ramdisk *<filename>*
show file ramdisk *<filename>* **checksum**
show file usbdrive0 *<filename>*
show file usbdrive0 *<filename>* **checksum**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*To display files located in the flash memory on products with CompactFlash® capability, the **flash** keyword must be specified whether or not a CompactFlash card is installed.*

*Not all units are capable of using a RAM disk file system or have a CompactFlash card installed. Use the **show file ?** command to display a list of valid commands at the enable prompt.*

The contents of the file are displayed only if the file is less than 300 kilobytes.
The checksum is displayed only if the file is less than 500 kilobytes.

Syntax Description

<filename>	Displays information on the specified file. Wildcard entries (such as ***.biz**) are not valid for the **show file** command.
cflash	Specifies a file located in CompactFlash memory.
checksum	Optional. Displays the message digest 5 (MD5) checksum of the specified file.
flash	Specifies a file located in flash memory.

ramdisk	Specifies a file located in volatile RAM disk.
usbdrive0	Specifies a file located in Universal Serial Bus (USB) flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 12.1	Command was expanded to include the **cflash** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include the **usbdrive0** parameter.

Usage Examples

The following is sample output from the **show file cflash** command:

```
>enable
#show file cflash startup-config
Router#show file startup-config
Using 2558 bytes
!
!
hostname “Router”
enable password password
!
clock timezone -6-Central-Time
!
ip subnet-zero
ip classless
ip routing
!
no auto-config
!
event-history on
no logging forwarding
no logging email
logging email priority-level info
!
no service password-encryption
!
username “admin” password “password”
!
--MORE--
```

The **show file ramdisk** command issues the following error message if the file is greater than 300 kilobytes:

>**enable**
#show file ramdisk NV3130A-17-07-00-26-AE.biz
%Cannot show files larger than 300000 bytes.

The following is sample **show file ramdisk** <*filename*> **checksum** output:

>**enable**
#show file ramdisk default-config.txt checksum
AA02EC815B93B0E41C738A71C6AFCBC4

show flash

Use the **show flash** command to display a list of all files currently stored in flash memory. Variations of this command include:

show flash
show flash *<filename>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<filename>	Optional. Displays details for a specified file located in flash memory. Enter a wildcard (such as ***.biz**) to display the details for all files matching the entered pattern.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show flash** command:

```
>enable
#show flash
Files:
 245669 010100boot.biz
1141553 new.biz
    821 startup-config
   1638 startup-config.old
1175679 020016.biz
    821 startup-config.bak
2572304 bytes used 4129776 available 6702080 total
System image file is “020100.biz”
```

show frame-relay

Use the **show frame-relay** command to display configuration and status parameters for configured virtual Frame Relay interfaces. Variations of this command include the following:

show frame-relay lmi
show frame-relay pvc
show frame-relay pvc interface frame-relay <*interface*>
show frame-relay pvc interface frame-relay <*interface*> **realtime**
show frame-relay pvc realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

lmi	Displays local management interface (LMI) statistics for each virtual Frame Relay interface.
pvc	Displays permanent virtual circuit (PVC) configuration and statistics for all virtual Frame Relay interfaces (or a specified interface).
interface frame-relay <*interface*>	Optional. Displays Frame Relay PVC statistics for a specific Frame Relay interface (for example, **fr 1**).
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 10.1	**Realtime** parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C)**. If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following are sample outputs from various **show frame-relay** commands:

```
>enable
#show frame-relay lmi
LMI statistics for interface FR 1 LMI TYPE = ANSI
Num Status Enq. Sent 79       Num Status Msgs Rcvd 71
Num Update Status Rcvd 12     Num Status Timeouts 5

>enable
#show frame-relay pvc
Frame Relay Virtual Circuit Statistics for interface FR 1
              Active      Inactive      Deleted      Static
local         2           0             0            2
DLCI = 16 DLCI USAGE = LOCAL PVC STATUS = ACTIVE INTERFACE = FR 1.16
MTU: 1500

```

show frame-relay fragment

Use the **show frame-relay fragment** command to display detailed fragmentation statistics for Frame Relay subinterfaces with FRF.12 fragmentation enabled. Variations of this command include:

show frame-relay fragment
show frame-relay fragment interface frame-relay <*subinterface*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface frame-relay <*subinterface*>	*Optional.* Displays detailed fragmentation statistics for the specified Frame Relay subinterface. Subinterfaces are expressed in the format *interface id.subinterface id* (for example, **fr 1.16**).

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following are sample outputs from various **show frame-relay fragment** commands:

>enable
#show frame-relay fragment

interface	dlci	frag_size	rx_frag	tx_frag	dropped_frag
fr 1.1	17	100	46	48	0
fr 1.2	18	200	42	21	0

>**enable**
#show frame-relay fragment frame-relay 1.1
DLCI = 17 FRAGMENT SIZE = 100

rx frag. pkts	46	tx frag. pkts	48
rx frag. bytes	4598	tx frag. bytes	4724
rx non-frag. pkts	18	tx non-frag. pkts	28
rx non-frag. bytes	1228	tx non-frag. bytes	1960
rx assembled pkts	23	tx pre-fragment pkts	34
rx assembled bytes	5478	tx pre-fragment bytes	6324
dropped reassembling pkts	0	dropped fragmenting pkts	0
rx out-of-sequence fragments	0		
rx unexpected beginning fragment	0		

show frame-relay multilink

Use the **show frame-relay multilink** command to display information associated with the Frame Relay multilink interface. Variations of this command include:

show frame-relay multilink
show frame-relay multilink detailed
show frame-relay multilink <*interface*>
show frame-relay multilink <*interface*> **detailed**
show frame-relay multilink interface frame-relay <*subinterface*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*interface*>	Optional. Specifies the display of information for a specific interface. Enter the **show frame-relay multilink ?** command for a complete list of interfaces.
detailed	Optional. Displays more detailed information.
interface frame-relay <*subinterface*>	Optional. Displays detailed fragmentation statistics for the specified Frame Relay subinterface. Subinterfaces are expressed in the format *interface id.subinterface id* (for example, **fr 1.16**).

Default Values

No default values are necessary for this command.

Command History

Release 9.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show frame-relay multilink** command:

>**enable**
#show frame-relay multilink
Bundle: frame-relay 1 is DOWN; class A bundle
Near-end BID: MFR1; Far-end BID: unknown

show garp timer

Use the **show garp timer** command to display the current configured Generic Attribute Registration Protocol (GARP) application timer values.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays the current configured GARP application timer values:

```
>enable
#show garp timer
Timer          Timer Value (milliseconds)
--------       --------------------------
Join            200
Leave           600
LeaveAll        10000
```

show global-policer

Use the **show global-policer** command to view virtual AOS (vAOS) global policer statistics.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

vAOS global policer statistics reveal valuable information about the data usage of the vAOS instance as it relates to the license allocated bandwidth for the vAOS instance. Using this information can be beneficial in determining if data needs are being met by the current license limit or if a higher bandwidth license is necessary.

The policer statistics are gathered from the interface statistics of the policed interfaces. If an interface's counters are cleared, those statistics are not included in the number displayed in the command output. The current aggregate traffic rate is computed over the configured global rate interval, which applies to the rate statistics for all interfaces. This interval is configurable via the command *statistics rate-interval <value> on page 1863*.

Usage Examples

The following example displays all vAOS global policer statistics:

```
>enable
#show global-policer
Global Policer
    Licensed Aggregate Traffic Rate     : 50 Mbps
    Current Aggregate Traffic Rate      : 15 Mbps (5 minute rate)
    Committed Burst Size                : 5625000 bytes
    Dropped Packets                     :1000 packets
    Dropped Bytes                       : 64000 bytes
    Last Cleared Time                   : Mon Nov 23 16:43:51 CST 2015

    Warning Events
    Period                              : 5 minutes
    Rate Threshold                      : 90% of licensed rate
    Dropped Packet Threshold            : 10000 packets
```

show gvrp configuration

Use the **show gvrp configuration** command to show a GARP VLAN Registration Protocol (GVRP) configuration summary for the switch.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays a GVRP configuration summary for the switch:

```
>enable
#show gvrp configuration
Global GVRP Configuration:
GVRP Feature is currently enabled globally.
GVRP Timers (milliseconds)
Join 200
Leave 600
LeaveAll 20000
Port based GVRP Configuration:
GVRP enabled ports
---------------------------------------------------
eth 0/24

#
```

show gvrp statistics

Use the **show gvrp statistics** command to show statistics related to GARP VLAN Registration Protocol (GVRP). Variations of this command include:

show gvrp statistics
show gvrp statistics interface *<interface>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface *<interface>*	Optional. Shows the information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show gvrp statistics interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example displays statistics related to GVRP for Ethernet interface 0/24:

```
>enable
#show gvrp statistics interface ethernet 0/24
Name: eth 0/24
Join Empty Received: 0
Join In Received: 272
Empty Received: 30
Leave Empty Received: 0
```

show hmr

Use the **show hmr** command to display Session Initiation Protocol (SIP) header manipulation rules (HMR) statistics from traffic to which an HMR policy is applied. The output can be filtered based on policy, policy user, rule set, direction, and message type. In addition, you can sort the output by policy, policy user, rule set, direction, or message type. This command can be used to determine the activity of an HMR policy, where they policy is most used, and by whom. Variations of this command include:

show hmr
show hmr direction in
show hmr direction out
show hmr message-type request
show hmr message-type response
show hmr policy *<name>*
show hmr rule-set *<name>*
show hmr sort direction in
show hmr sort direction out
show hmr sort message-type request
show hmr sort message-type response
show hmr sort policy *<name>*
show hmr sort user
show hmr user global
show hmr user proxy-server
show hmr user proxy-user
show hmr user *<user>*

*Each of the **show hmr** command variations can be used multiple times within a single command. For example, you can display SIP HMR statistics for a specified policy and direction by entering **show hmr policy MYPOLICY1 direction in**.*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

direction in	Optional. Limits the command output to SIP HMR statistics for inbound SIP traffic.
direction out	Optional. Limits the command output to SIP HMR statistics for outbound SIP traffic.
message-type request	Optional. Limits the command output to SIP HMR statistics for request messages.

message-type response	Optional. Limits the command output to SIP HMR statistics for response messages.
policy <*name*>	Optional. Limits the command output to SIP HMR statistics for a specified HMR policy.
rule-set <*name*>	Optional. Limits the command output to SIP HMR statistics for a specified rule set.
sort	Optional. Sorts SIP HMR statistics by direction, message type, policy name, or policy user.
user global	Optional. Limits the command output to SIP HMR statistics for the SIP stack.
user proxy-server	Optional. Limits the command output to SIP HMR statistics for SIP proxy servers.
user proxy-user	Optional. Limits the command output to SIP HMR statistics for SIP proxy users.
user <*user*>	Optional. Limits the command output to SIP HMR statistics for a specified user.

Default Values

No default values necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example displays all HMR statistics:

>**enable**
#show hmr
Policy: MyPolicy1
Msgs Evaluated: 0
Msgs Altered: 0
User Application: Global inbound request

Rule Set	Message Rule	Action	Seq #	Count
Set 1	Rule1	Modify Variable	10	0
		Modify Variable	20	0
		Add Header	30	3
		Modify Header	40	2

show hosts

Use the **show hosts** command to display the contents of the domain naming system (DNS) host table. Output from this command displays both Internet Protocol version 4 (IPv4) and IPv6 entries, as well as separate server addresses for the DNS client and proxy. Variations of this command include:

show hosts
show hosts realtime
show hosts verbose
show hosts vrf <*name*>
show hosts vrf <*name*> **realtime**
show hosts vrf <*name*> **verbose**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

realtime	Optional. Displays information in real time.
verbose	Optional. Displays the details of the IP name, style, name servers, and host table entries without the truncation of long IP addresses and host names.
vrf <*name*>	Optional. Displays DNS information for the specified virtual routing and forwarding (VRF) instance. If no VRF instance is specified, host table information for the default VRF instance is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** <*name*> parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command was expanded to include both IPv4 and IPv6 entries in the output and the **realtime** keyword.

Functional Notes

The list below describes the fields contained in the DNS host table:

- Flags: Indicate whether the entry is permanent (perm) or temporary (temp).
- Age: Indicates the age of the entry.
- Type: Shows the protocol type as addresses (A) or service (SRV).
- Priority: 1 or 2.
- Address: Displays the IP address for the entry.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example is sample output from the **show hosts** command:

>**enable**
#show hosts

Name/address lookup uses domain name service
DNS Proxy is enabled
Name servers are 10.23.115.254
Current proxy server is 10.23.115.254
Current client server is 10.23.115.254

Host	Flags	Age	Type	Priority	Address/Alias
abc.com	temp	193	A		-2000:ef0a::1500:37af:362:ed
Archive.msstate.edu	temp	16907	A		-130.18.80.18
dns11.11nwd.net	temp	673	A		-200:a50:1a0e::1500:eddf

show http secure-server certificate

Use the **show http secure-server certificate** command to display information regarding HTTPS private key and certificates.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.7.0	Command was introduced.

Usage Examples

The following is sample output from the **show http secure-server certificate** command:

```
>enable
#show http secure-server certificate
Certificate:
   Data:
      Version: 3 (0x2)
      Serial Number:
         70:a2:aa:7c:8e:d8:dd:b2:68:e1:58:65:55:84:69:81:19:91:7b:29
   Signature Algorithm: sha256WithRSAEncryption
      Issuer: C=US, ST=AL, L=Huntsville, O=Adtran, Inc., CN=NetVanta
      Validity
         Not Before: Jun 19 19:11:09 2015 GMT
         Not After : Jun 17 19:11:09 2023 GMT

show hw-access-list

Use the **show hw-access-list** command to display hardware access control list (ACL) configuration and statistics. Variations of this command include:

show hw-access-list

show hw-access-list <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*name*>	Optional. Specifies a particular hardware ACL to display.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.

Functional Notes

The **show hw-access-list** command displays all configured hardware ACLs in the system. All entries in the ACL are displayed, and a counter indicating the number of frames matching the entry is listed.

Usage Examples

The following is sample output from the **show hw-access-list** <*name*> command, using the hardware ACL **NET135**:

```
>enable
#show hw-access-list NET135
Extended IP hardware access list NET135
  permit ip 10.22.135.0 0.0.0.255  any    log (302 matches)
  permit ip any  10.22.135.0 0.0.0.255    log (279 matches)
```

The following is sample output from the **show hw-access-list** command which displays information for all configured hardware ACLs:

```
>enable
#show hw-access-list
Extended IP hardware access list NET135
   permit ip 10.22.135.0 0.0.0.255  any    log (131 matches)
   permit ip any  10.22.135.0 0.0.0.255    log (110 matches)
Extended MAC hardware access list ADTN
  permit mac 00:a0:c8:00:00:00 00:00:00:ff:ff:ff any log (44055 matches)
  permit mac any 00:a0:c8:00:00:00 00:00:00:ff:ff:ff log (3011 matches)
```

show hw-access-map

Use the **show hw-access-map** command to display hardware access map configuration and statistics. Variations of this command include:

show hw-access-map
show hw-access-map *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Displays only the statistics for the named hardware access map.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.

Usage Examples

The following is sample output from the **show hw-access-map** *<name>* command, using the access map **HW-FILTER**:

```
>enable
#show hw-access-map HW-FILTER
Hardware Access Map HW-FILTER
  Forward: mac ADTN and ip NET135
  VLANs: 2-3
```

show hw-filter-resource

Use the **show hw-filter-resource** command to display the used and available hardware filter resources. This information is valuable when making changes to configured hardware access control lists (ACLs) and hardware access maps. For more information on hardware ACLs and access maps, refer to the *Hardware ACL and Access Map Command Set on page 4235*.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.

Functional Notes

Changing hardware ACL or hardware access map configuration or application causes new information to be reinstalled on the hardware. It is possible to run out of hardware resources depending on how many resources are needed to apply the desired change. If there are not enough hardware resources to install the new criteria, an error message is displayed.

Usage Examples

The following is sample output from the **show hw-filter-resource** command:

```
>enable
#show hw-filter-resource
Total Rules: 512
Rules Used: 128
```

show interfaces

Use the **show interfaces** command to display configuration parameters and current statistics for all interfaces (or a specified interface). Variations of this command include the following:

show interfaces
show interfaces description
show interfaces status
show interfaces <*interface*>
show interfaces <*interface*> **extended**
show interfaces <*interface*> **performance-statistics**
show interfaces <*interface*> **performance-statistics** <*x-y*>
show interfaces <*interface*> **performance-statistics 15-minute**
show interfaces <*interface*> **performance-statistics 15-minute** <*value*>
show interfaces <*interface*> **performance-statistics 24-hour**
show interfaces <*interface*> **performance-statistics 24-hour** <*value*>
show interfaces <*interface*> **performance-statistics total-24-hour**
show interfaces <*interface*> **realtime**
show interfaces <*interface*> **verbose**
show interfaces <*interface*> **version**

*Not all subcommands apply to all interfaces or are available on all AOS units. Type **show interfaces** <interface> **?** for a list of valid subcommands for the specified interface. Some subcommands are only valid on AOS units with switchport or gigabit switchport interfaces. Enter the **show interfaces ?** command to display a list of valid subcommands for your specific platform.*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<interface>	Optional. Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show interfaces ?** for a complete list of valid interfaces.
description	Displays information, such as description, administrative status, line protocol status, and description for the interfaces.
status	Displays information, such as description, type, status, virtual local area network (VLAN), speed, and duplex for the interfaces. This subcommand is only available on AOS units with switchport or Gigabit-switchport interfaces.
extended	Optional. Displays extended medium attachment unit (MAU) statistics.
performance-statistics	Optional. Displays line performance statistics.
<x-y>	Optional. Shows a specified interval (x) or range of intervals (x-y). Valid range is 1 to 96.
total-24-hour	Optional. Displays the current 24-hour totals.
<value>	Optional. Specifies which 15-minute period in the last 24 hours or which 24-hour period in the last 7 days is displayed. Range for 15-minute periods is **1** to **96**; range for 24-hour periods is **1** to **7**.
15-minute	Optional. Displays the statistics for a 15-minute period in the last 24 hours.
24-hour	Optional. Displays the statistics for a 24-hour period in the last 7 days.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
verbose	Optional. Displays detailed configuration information on the terminal screen (versus only the nondefault values).
version	Optional. Displays current version information (e.g., model and list number, software version, etc.) for the interface.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 6.1	Command was updated to include the **performance-statistics** parameter to display RFC 2662 line performance statistics.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 10.1	Command was expanded to include the **realtime** parameter. The primary rate interface (PRI) was also added.

Release 11.1	Command was expanded to include the **description**, **status**, and **verbose** parameters. The demand, foreign exchange office (FXO), and serial interfaces were also added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the **realtime** and **extended** parameters. The Gigabit Ethernet interface was also added.
Release 18.3	Command was expanded to include the **extended** parameter.
Release R10.10.0	Command was expanded to include the Ethernet in the first mile (EFM) link and EFM group interfaces.
Release R10.11.0	Command was expanded to include the T4 interface.
Release R11.2.0	Command was expanded to include the very high-speed digital subscriber line (VDSL) interfaces.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.
Release R12.1.0	Command output was modified for virtual AOS (vAOS) instances.
Release 13.1.0	Command was expanded to include the virtual extensible local area network (VxLAN) tunnel interface.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show interfaces description** command:

```
>enable
#show interfaces description
Interface       Status          Protocol        Description
eth 0/1         Admin Up        Line Up         Desk 1
eth 0/2         Admin Up        Line Up         Desk 2
eth 0/3         Admin Up        Line Up         Desk 3
eth 0/4         Admin Up        Line Up         Desk 4
eth 0/5         Admin Up        Line Up         Desk 5
eth 0/6         Admin Up        Line Up         Desk 6
eth 0/7         Admin Up        Line Up         Desk 7
eth 0/8         Admin Up        Line Down       Desk 8
eth 0/9         Admin Up        Line Up         Desk 9
eth 0/10        Admin Up        Line Up         Desk 10
```

eth 0/11	Admin Up	Line Up	Desk 11
eth 0/12	Admin Up	Line Up	Desk 12
eth 0/13	Admin Up	Line Up	Desk 13
eth 0/14	Admin Up	Line Up	Desk 14
eth 0/15	Admin Up	Line Up	Desk 15
eth 0/16	Admin Up	Line Up	Desk 16
eth 0/17	Admin Up	Line Up	Desk 17
eth 0/18	Admin Up	Line Up	Desk 18
eth 0/19	Admin Up	Line Up	Desk 19
eth 0/20	Admin Up	Line Up	Desk 20
eth 0/21	Admin Up	Line Up	Desk 21
eth 0/22	Admin Up	Line Up	Desk 22
eth 0/23	Admin Up	Line Up	Desk 23
eth 0/24	Admin Up	Line Up	Desk 24
giga-eth 0/1	Admin Up	Line Up	Uplink Trunk
giga-eth 0/2	Admin Up	Line Down	Unused

The following is sample output from the **show interfaces status** command:

```
>enable
#show interfaces status
```

Port	Name	Status	Vlan	Duplex	Speed	Type
eth 0/1		connected	trunk	a-full	a-100	10/100
eth 0/2		notconnected	trunk	?	?	10/100
eth 0/3		notconnected	trunk	?	?	10/100
eth 0/4		notconnected	trunk	?	?	10/100
eth 0/5		notconnected	trunk	?	?	10/100
eth 0/6		notconnected	trunk	?	?	10/100
eth 0/7		notconnected	trunk	?	?	10/100
eth 0/8		notconnected	trunk	?	?	10/100
eth 0/9		notconnected	trunk	?	?	10/100
eth 0/10		notconnected	trunk	?	?	10/100
eth 0/11		notconnected	trunk	?	?	10/100
eth 0/12		notconnected	trunk	?	?	10/100
eth 0/13		notconnected	trunk	?	?	10/100
eth 0/14		notconnected	trunk	?	?	10/100
eth 0/15		notconnected	trunk	?	?	10/100
eth 0/16		notconnected	trunk	?	?	10/100
eth 0/17		notconnected	trunk	?	?	10/100
eth 0/18		notconnected	trunk	?	?	10/100
eth 0/19		notconnected	trunk	?	?	10/100
eth 0/20		notconnected	trunk	?	?	10/100
eth 0/21		notconnected	trunk	?	?	10/100
eth 0/22		notconnected	trunk	?	?	10/100
eth 0/23		notconnected	trunk	?	?	10/100
eth 0/24		notconnected	trunk	?	?	10/100

giga-eth 0/1	notconnected	trunk	?	?	Gig
giga-eth 0/2	notconnected	trunk	?	?	Gig

The following are samples from various **show interfaces** commands:

```
>enable

   0 runts, 0 giants, 0 throttles
   0 input errors, 0 CRC, 0 frame
   0 abort, 0 ignored, 0 overruns
   32 packets output, 0 bytes, 0 underruns
   0 input clock glitches, 0 output clock glitches
```

*If the user has configured a **Bc** and **Be** value on the virtual circuit, the bandwidth (**BW**) displayed is the sum of those values (Bc + Be). If not, the value for **BW** is the speed of the interface. The **Average utilization** displayed is the average utilization of the displayed bandwidth. If the bandwidth number is the Bc + Be value, the (**limited**) text appears (as shown above).*

show interfaces adsl <*slot/port*>

Use the **show interfaces adsl** command to display information related to the asymmetric digital subscriber line (ADSL) port. Variations of this command include:

show interfaces adsl <*slot/port*>
show interfaces adsl <*slot/port*> **information**
show interfaces adsl <*slot/port*> **information atuc**
show interfaces adsl <*slot/port*> **information atur**
show interfaces adsl <*slot/port*> **information bit-allocation**
show interfaces adsl <*slot/port*> **performance-statistics**
show interfaces adsl <*slot/port*> **performance-statistics** <*x-y*>
show interfaces adsl <*slot/port*> **performance-statistics total-24-hour**
show interfaces adsl <*slot/port*> **performance-statistics total-previous-24-hour**
show interfaces adsl <*slot/port*> **version**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*slot/port*>	Specifies ADSL interface slot and port number.
information	Optional. Displays all ADSL interface information.
atuc	Optional. Displays only ADSL remote information.
atur	Optional. Displays only ADSL local information.
bit-allocation	Optional. Displays only ADSL DMT bit-allocation table.
performance-statistics	Optional. Displays all 96 stored intervals.
<*x-y*>	Optional. Displays only a specified interval (x) or range of intervals (x-y). Valid range is **1** to **96**.
total-24-hour	Optional. Displays only the current 24-hour totals.
total-previous-24-hour	Optional. Displays only the previous 24-hour totals.
version	Optional. Displays current version information (e.g., model and list number, software version, etc.) for the interface.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output for this command:

```
>enable
#show interfaces adsl 1/1 information
adsl 1/1 line information
adsl 1/1 Local Line Information
 Vendor Id:                    00000000
 Serial Number:                00000000
 Firmware Version:
 ADSL Capabilities             G.DMT, G.LITE, ADSL2, ADSL2+
adsl 0/1 Remote Line Information
 Vendor Id:                    00000000
 Serial Number:                00000000
 Firmware Version:             0
 ADSL Capabilities       G.DMT, G.LITE, ADSL2, ADSL2+
```

show interfaces cellular

Use the **show interfaces cellular** command to display configuration parameters and current statistics for a cellular interface. Variations of this command include the following:

show interfaces cellular <*slot*/*port*>
show interfaces cellular <*slot*/*port*> **hardware**
show interfaces cellular <*slot*/*port*> **profile**
show interfaces cellular <*slot*/*port*> **realtime**
show interfaces cellular <*slot*/*port*> **version**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*slot/port*>	Specifies cellular interface slot and port number.
hardware	Optional. Specifies cellular hardware information is displayed.
profile	Optional. Specifies cellular profile information is displayed.
realtime	Optional. Specifies display output is shown in real time.
version	Optional. Specifies cellular version information is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example displays cellular **hardware** information for cellular interface **1/1**:

```
>enable
#show interfaces cellular 1/1 hardware
Electronic Serial Number (ESN) : 0x12345678
Preferred Roaming List (PRL) Version : 12345
Mobile Directory Number (MDN) : 0123456789
Mobile Station ID (MSID) : 0123456789
System ID (SID) : 1234
Network ID (NID) : 12
```

show interfaces dot11ap

Use the **show interfaces dot11ap** command to display information related to a wireless access point (AP), radio, or virtual access point (VAP) interface. Variations of this command include:

show interfaces dot11ap [*<ap>* | *<ap/radio>* | *<ap/radio.vap>***]**
show interfaces dot11ap *<ap>* **control-protocol**
show interfaces dot11ap [*<ap/radio>* | *<ap/radio.vap>***] dot11**

> NOTE
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<ap>	Specifies the AP. Range is **1** to **8**.
</radio>	Specifies the radio associated with the AP. Range is **1** to **2**.
<.vap>	Specifies the VAP associated with the radio. Range is **1** to **8**.
control-protocol	Optional. Displays properties of the control protocol for the AP.
dot11	Optional. Displays counters of an 802.11 radio's VAPs.

> NOTE
> *The radio must be specified in the format <ap/radio> (for example, **2/1** indicates radio 1 on access point 2). The virtual access point must be specified in the format <ap/radio.vap> (for example, **2/1.1** indicates virtual access point 1 on radio 1 on access point 2).*

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output for the AP interface 1 using the **show interfaces dot11ap** command:

```
>enable
#show interfaces dot11ap 1
Dot11 AP 1 line protocol is UP
 Controller Status: Local AC in control
 Ap Version: FW: 1.0 0.4, DRVR: 1.0 0.0, HW: 1.0 0.0
 Ap S/N: LBADTN0625XC975
 AP MAC address: 00:A0:C8:1D:F8:57
 Radio1 - 802.11bg - Enabled, channel 0, address: 00:A0:C8:1D:F8:59
 Radio2 - 802.11a - Disabled, channel 0, address: 00:A0:C8:1D:F8:58
 Bootup Status: Normal
 Ap Status: With Session
 Controlling AC: 00:A0:C8:20:E7:D6
 802.1Q Encapsulation - Disabled
 Auto 100Mbps, Full Duplex

 Ethernet Statistics:
   Ethernet Rx Packets: 291476
   Ethernet Rx Bytes: 20908434
   Ethernet Tx Packets: 67346
   Ethernet Tx Bytes: 10606783
```

The following is sample output for the AP interface 1 using the **show interfaces dot11ap** <*ap*> **control-protocol** command:

```
>enable
#show interfaces dot11ap 1 control-protocol
AP State: Running with session
 Control State: Controlled by this AC
   Control Protocol Transmit Bytes: 4080386
   Control Protocol Receive Bytes: 9435172
   Control Protocol Transmit Packets: 52203
   Control Protocol Receive Packets: 65931
   Control Protocol Receive Keepalives: 14914
   Control Protocol Receive Security Errors: 0
   Control Protocol Dropped Packets: 0
   Control Protocol Protocol Errors: 0
   Control Protocol Protocol No Responses: 0
```

The following is sample output for the radio interface 1 on AP interface 1 using the **show interfaces dot11ap** <*ap/radio*> *dot11* command:

```
>enable
#show interfaces dot11ap 1/1 dot11
Authentication Count: 17
 Deauthentication Count: 48
 Association Count: 18
 Disassociation Count: 12
 Reassociation Count: 0
 Wireless MSDU Rx Packets: 346
 Wireless Data Rx Packets: 7221
 Wireless Multicast Rx Packets: 308
 Wireless Management Rx Packets: 667521
 Wireless Control Rx Packets: 0
 Wireless MSDU Tx Packets: 236613
 Wireless Data Tx Packets: 236210
 Wireless Multicast Tx Packets: 236166
 Wireless Management Tx Packets: 599
 Wireless Control Tx Packets: 0
```

show interfaces efm-group

Use the **show interfaces efm-group** command to view the interface statistics for the specified Ethernet in the first mile (EFM) group. Variations of this command include:

show interfaces efm-group all
show interfaces efm-group all connections
show interfaces efm-group *<group number>*
show interfaces efm-group *<group number>* **connections interval 15-minute** *<value>*
show interfaces efm-group *<group number>* **connections interval 24-hour** *<value>*
show interfaces efm-group *<group number>* **interval 15-minute** *<value>*
show interfaces efm-group *<group number>* **interval 24-hour** *<value>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

all	Displays statistics for all EFM groups.
<group number>	Displays statistics for a single EFM group. Range is **1** to **1024**.
connections	Optional. Displays the statistics for the connected interfaces.
interval 15-minute	Optional. Displays the statistics for a 15-minute period in the last 24 hours.
interval 24-hour	Optional. Displays the statistics for a 24-hour period in the last 7 days.
<value>	Specifies which 15-minute period in the last 24 hours or which 24-hour period in the last 7 days is displayed. Range for 15-minute periods is **1** to **4**; range for 24-hour periods is **1** to **7**.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example shows the statistics for the interfaces connected to EFM group **1** in the first 15-minute period of the last 24 hours:

```
>enable
#show interfaces efm-group 1 connections interval 15-minute 1
EFM Group 1 Connections (15-Minute Interval 1):
    412/900 seconds elapsed in interval
    interface shdsl 1/1 connected
            NE in sync, FE in sync,
            NE in tx, FE in tx
            No alarms.
            109 fragments input, 1111 fragments output
            0 errored fragments, 0 discarded fragments
            0 fragments too small, 0 fragments too large
            0 fcs errors, 0 coding errors
    interface shdsl 1/2 connected
            NE in sync, FE in sync,
            NE in tx, FE in tx
            No alarms.
            109 fragments input, 1111 fragments output
            0 errored fragments, 0 discarded fragments
            0 fcs errors, 0 coding errors
    interface shdsl 1/3 connected
            NE in sync, FE in sync,
            NE in tx, FE in tx
            No alarms.
            109 fragments input, 1121 fragments output
            0 errored fragments, 0 discarded fragments
            0 fcs errors, 0 coding errors
    interface shdsl 1/4 connected
            NE in sync, FE in sync,
            NE in tx, FE in tx
            No alarms.
            109 fragments input, 1109 fragments output
            0 errored fragments, 0 discarded fragments
            0 fcs errors, 0 coding errors
```

show interfaces gigabit-switchport <*slot/port*>

Use the **show interfaces gigabit-switchport** command to display configuration parameters and current statistics for gigabit switchport interfaces. These commands are valid only on AOS units with gigabit switchport interfaces. Variations of this command include the following:

show interfaces gigabit-switchport <*slot/port*>
show interfaces gigabit-switchport <*slot/port*> **realtime**
show interfaces gigabit-switchport <*slot/port*> **switchport**
show interfaces gigabit-switchport <*slot/port*> **switchport vlans**

*Not all subcommands apply to all interfaces or are available on all AOS units. Type **show interfaces** <interface> **?** for a list of valid subcommands for the specified interface. Some subcommands are only valid on AOS units with switchport or gigabit switchport interfaces. Enter the **show interfaces ?** command to display a list of valid subcommands for your specific platform.*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*slot/port*>	Specifies a gigabit switchport interface slot and port number. Type **show interfaces description** for a complete list of valid gigabit switchport interfaces.
switchport	Displays switchport settings and statistics for the specified gigabit switchport interface.
vlans	Optional. Displays the VLAN membership information for a specific gigabit switchport interface.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show interfaces gigabit-switchport 0/1** command:

```
>enable
#show interfaces gigabit-switchport 0/1
giga-swx 0/1 is UP, line protocol is UP
  Hardware address is 00:A0:C8:01:2F:55
  RJ-45 Shielded
  100Mb/s, negotiated full-duplex, configured full-duplex
  input flow control is disabled, 0 pause frames received
  ARP type: ARPA; ARP timeout is 20 minutes
  Last clearing of "show interface" counters: never
  5 minute input rate 6128 bits/sec, 7 packets/sec
  5 minute output rate 640 bits/sec, 1 packets/sec
    0 total jumbo frames
    41005094 packets input, 3524287214 bytes
    20102647 unicasts, 15808395 broadcasts, 5094052 multicasts input
    0 unknown protocol, 9830 discards
    0 input errors, 0 runts, 0 giants
    0 alignment errors, 0 crc errors
    236869 packets output, 71234821 bytes
    75670 unicasts, 57387 broadcasts, 103812 multicasts output
    0 output errors, 0 deferred, 0 discards
    0 single, 0 multiple, 0 late collisions
    0 excessive collisions

  L3 Switch
    498 packets input, 0 packets forwarded
    0 header errors, 11 discards
```

The following is sample output from the **show interfaces gigabit-switchport 0/1 switchport** command:

```
>enable
#show interfaces gigabit-switchport 0/1 switchport
Name: giga-swx 0/1
Switchport: enabled
Administrative Mode: access
Negotiation of Trunking: access
```

Access Mode VLAN (configured): 1
Trunking Native Mode VLAN: 1
Trunking VLAN Enabled: 1-4094
Trunking VLAN GVRP Fixed: none
Port Expiration: disabled
Port Security: disabled
Protected: false

The following is sample output from the **show interfaces gigabit-switchport 0/1 switchport vlan** command:

>**enable**
#show interfaces gigabit-switchport 0/1 switchport vlan
Interface Membership Vlans
---
giga-swx 0/1 Configured 1

show interfaces shdsl <*slot/port*> splice-detect

Use the **show interfaces shdsl splice-detect** command to view the bad splice detection test results for the specified interface. Variations of this command include:

show interfaces shdsl <*slot/port*> **splice-detect 24-hour**

show interfaces shdsl <*slot/port*> **splice-detect 24-hour** <*interval*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*slot/port*>	Specifies the slot and port of the interface on which the test was run.
splice-detect 24-hour	Displays the bad splice detection test results for the last 24 hours.
<*interval*>	Optional. Specifies that results from one or more of the previous 24-hour intervals are displayed. Valid interval range is **1** to **7**. You can enter a single interval, or a range of intervals when separated by a dash.

Default Values

No default values are necessary for this command.

Command History

Release A4.05	Command was introduced.

Usage Examples

The following example displays the bad splice detection test results for SHDSL interface **1/1** over the past 24 hours:

#show interfaces shdsl 1/1 splice-detect 24-hour

Current Splice Detect Data

Summary: No Trouble Found

Distance (ft)	Count
0	0
200	0
400	0
600	0
800	0
1000	0
1200	0

show interfaces switchport <*slot/port*>

Use the **show interfaces switchport** command to display configuration parameters and current statistics for switchport interfaces. These commands are valid only on AOS units with switchport interfaces. Variations of this command include the following:

show interfaces switchport <*slot/port*> **realtime**
show interfaces switchport <*slot/port*> **switchport**
show interfaces switchport <*slot/port*> **switchport vlans**

*Not all subcommands apply to all interfaces or are available on all AOS units. Type **show interfaces** <interface> **?** for a list of valid subcommands for the specified interface. Some subcommands are only valid on AOS units with switchport or gigabit switchport interfaces. Enter the **show interfaces ?** command to display a list of valid subcommands for your specific platform.*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<slot/port>	Specifies a switchport interface slot and port number. Type **show interfaces description** for a complete list of valid switchport interfaces.
switchport	Displays switchport settings and statistics for the specified switchport interface.
vlans	Optional. Displays the VLAN membership information for a specific switchport interface.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 10.1	Command was expanded to include the **vlans** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show interfaces switchport 0/1** command:

```
>enable
#show interfaces switchport 0/1
swx 0/1 is DOWN, line protocol is DOWN
  Hardware address is 00:A0:C8:00:61:22
  BW is 10000 Kbit
  ?b/s, negotiated ? duplex, configured full-duplex
  input flow control is disabled, 0 pause frames received
  ARP type: ARPA; ARP timeout is 20 minutes
  Last clearing of "show interface" counters: never
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    Queueing method: fifo
    Output queue: 0/256/0 (size/max total/drops)
    Interface Shaper: NOT ENABLED
    0 packets input, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts input
    0 symbol errors, 0 discards
    0 input errors, 0 runts, 0 giants
    0 alignment errors, 0 crc errors
    0 packets output, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts output
    0 output errors, 0 deferred, 0 discards
    0 single, 0 multiple, 0 late collisions
    0 excessive collisions
```

The following is sample output from the **show interfaces switchport 0/1 switchport** command:

```
>enable
#show interfaces switchport 0/1 switchport
Name: swx 0/1
Switchport: enabled
Administrative Mode: access
Negotiation of Trunking: access
Access Mode VLAN (configured): 1
Trunking Native Mode VLAN: 1
```

Trunking VLAN Enabled: 1-4094
Trunking VLAN GVRP Fixed: none
Port Expiration: disabled
Port Security: disabled

The following is sample output from the **show interfaces switchport 0/1 switchport vlans** command:

>**enable**
#show interfaces switchport 0/1 switchport vlans
Interface Membership Vlans
---
swx 0/1 Configured 1

show ip access-lists

Use the **show ip access-lists** command to display all configured Internet Protocol version 4 (IPv4) access control lists (ACLs) in the system. Variations of this command include:

show ip access-lists
show ip access-lists *<ipv4 acl name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv4 acl name>	Optional. Specifies a particular IPv4 ACL to display.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

The **show ip access-lists** command displays all configured IPv4 ACLs in the system. All entries in the IPv4 ACL are displayed, and a counter indicating the number of packets matching the entry is listed.

Usage Examples

The following is sample output from the **show ip access-lists** command, and displays information for IPv4 ACLs:

```
>enable
#show ip access-lists
Standard IP access list MatchAll
   permit host 10.3.50.6 (0 matches)
   permit 10.200.5.0 wildcard bits 0.0.0.255 (0 matches)
Extended IP access list UnTrusted
   deny   icmp 10.5.60.0 wildcard bits 0.0.0.255 any source-quench (0 matches)
   deny   tcp any any   (0 matches)
```

show ip arp

Use the **show ip arp** command to display the Address Resolution Protocol (ARP) table. Variations of this command include:

show ip arp
show ip arp realtime
show ip arp vrf <*name*>
show ip arp vrf <*name*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance or your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
vrf <*name*>	Optional. Displays information only for the specified virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show ip arp** command:

```
>enable
#show ip arp
ADDRESS         TTL(min)    MAC ADDRESS        INTERFACE    TYPE
10.22.18.3      19          00:E0:29:6C:BA:31  eth 0/1      Dynamic
192.168.20.2    16          00:A0:C8:0D:E9:AD  eth 0/2      Dynamic
224.0.0.5       20          01:00:5E:00:00:05  eth 0/2      Permanent
```

show ip cache

Use the **show ip cache** command to display the contents of the Internet Protocol version 4 (IPv4) route cache for each interface in a given virtual private network (VPN) routing and forwarding (VRF) instance. The route cache contains information about which egress interface, IPv4 gateway address, and MAC address to use when forwarding packets to a given destination. Variations of this command include:

show ip cache
show ip cache vrf <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

vrf <*name*>	Optional. Specifies a nondefault VRF instance for which to display route cache information. If no VRF instance is specified, route cache information for the default VRF instance is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show ip cache** command for the default VRF (router):

```
>enable
#show ip cache
DESTINATION     INTERFACE  NEXT HOP      USE COUNT  MAC ADDRESS
224.0.0.5       Loopback   127.0.0.1     0
10.22.18.3      eth 0/1    10.22.18.3    0          00:E0:29:6C:BA:31
10.22.18.6      Loopback   127.0.0.1     18
192.168.30.2    eth 0/2    192.168.20.2  0          00:A0:C8:0D:E9:AD
10.22.18.255    Loopback   127.0.0.1     2
255.255.255.255 Loopback   127.0.0.1     2
192.168.20.1    Loopback   127.0.0.1     25
IP routing cache 7 entries
```

show ip crypto ipsec

Use the **show ip crypto ipsec** command to display information regarding the Internet Protocol security (IPsec) configuration. Variations of this command include the following:

show ip crypto ipsec sa
show ip crypto ipsec sa address *<ip address>*
show ip crypto ipsec sa brief
show ip crypto ipsec sa ffe-id *<rapidroute interface ID>*
show ip crypto ipsec sa map *<name>*
show ip crypto ipsec sa profile *<name>*
show ip crypto ipsec sa remote-id *<name>*
show ip crypto ipsec timeline
show ip crypto ipsec transform-set
show ip crypto ipsec transform-set *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

sa	Displays all IPsec security associations (SAs).
sa address *<ip address>*	Optional. Displays all IPsec SAs associated with the designated peer IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
sa brief	Optional. Displays a brief listing of IPsec SAs.
sa ffe-id *<rapidroute interface ID>*	Optional. Displays all IPsec SAs associated with a specific RapidRoute interface. RapidRoute interfaces have a numerical identifier that ranges between **1** and **16777215**. These identifiers are displayed in the various outputs of the **show ip ffe** commands beginning with the command *show ip ffe on page 708***.**
sa map *<name>*	Optional. Displays all IPsec SAs associated with the specified crypto map.
sa profile *<name>*	Optional. Displays all IPsec SAs associated with the specified IPsec profile.
sa remote-id	Optional. Displays all IPsec SAs associated with the designated peer remote ID.
timeline	Optional. Displays a timeline of VPN tunnel creation and peak number of tunnels per hour.

transform-set	Displays all defined transform sets.
<name>	Optional. Displays information for a specific transform set.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 15.1	Command was expanded to include the **brief** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.6	Command was expanded to include the **ffe-id** parameter.
Release A4.01	Command was expanded to include the **timeline** parameter.
Release R10.5.0	Command syntax was changed to require the **ip** parameter.
Release R11.9.0	Command was expanded to include the **sa profile** <*name*> parameter.

Usage Examples

The following is sample output from the **show ip crypto ipsec sa** command:

>**enable**
#show ip crypto ipsec sa
Using 2 SAs out of 4000
Peak concurrent SAs: 2
IPsec Security Associations:

Peer IP Address: 3.3.3.1
  Remote ID: 3.3.3.2
  Crypto Map: VPN 10
  Direction: Inbound
  Encapsulation: ESP
  SPI: 0xF38B37A1 (4085987233)
  FFE ID: 1
  RX Bytes: 281728
  Selectors: Src:10.0.2.0/255.255.255.0 Port:ANY Proto:ALL IP
        Dst:10.0.1.0/255.255.255.0 Port:ANY Proto:ALL IP
  Hard Lifetime: 28570
  Soft Lifetime: 0
  Out-of-Sequence Errors: 0

show ip crypto map

Use the **show ip crypto map** command to display information regarding Internet Protocol version 4 (IPv4) crypto map settings. Variations of this command include the following:

show ip crypto map
show ip crypto map interface *<interface>*
show ip crypto map *<name>*
show ip crypto map *<name> <number>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface *<interface>*	Optional. Displays the IPv4 crypto map settings for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show crypto map interface ?** for a complete list of valid interfaces.
<name>	Optional. Specifies an IPv4 specific crypto map name.
<number>	Optional. Specifies an IPv4 specific crypto map number.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R10.7.0	Command was changed to include the **ip** keyword for Internet Protocol version 6 (IPv6) support.

Usage Examples

The following is sample output from the **show ip crypto map** command:

```
>enable
#show ip crypto map testMap
Crypto Map “testMap” 10 ipsec-ike
 Extended IP access list NewList
 Peers:
   63.97.45.57
 Transform sets:
   esp-des
 Security-association lifetimes:
   0 kilobytes
   86400 seconds
 No PFS group configured
 Interfaces using crypto map testMap:
   eth 0/1
```

show ip dhcp binding

Use the **show ip dhcp binding** command to display the Dynamic Host Client Protocol version 4 (DHCPv4) server client table with associated information. Variations of this command include:

show ip dhcp binding
show ip dhcp binding *<ipv4 address>*
show ip dhcp binding vrf *<name>*
show ip dhcp binding vrf *<name> <ipv4 address>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv4 address>	Optional. Specifies the IPv4 address of the specified client. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
vrf *<name>*	Optional. Displays information only for the specified virtual routing and forwarding (VRF) instance. If a VRF is not specified, the default VRF is assumed.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** parameter and the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword on Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword on Adtran voice products.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show ip dhcp binding** command:

```
>enable
#show ip dhcp binding
IP Address      Client Id              Lease Expiration        Client Name
10.100.23.64    01:00:a0:c8:00:8f:b3   Aug 15 2002 11:02 AM    Router
```

The following is sample output from the **show ip dhcp binding vrf Gray** command:

```
>enable
#show ip dhcp binding vrf Gray
IP Address      Client Id              Lease Expiration        Client Name
192.168.19.2    01:00:e0:29:91:1e:27   Oct 16 2007 10:58 AM    Estclair4
192.168.19.3    01:00:e0:81:01:53:01   Oct 16 2007 12:42 PM    sylvester
192.168.19.4    01:00:15:c5:6a:69:ec   Oct 16 2007 1:35 PM     Dell-Wifi06
```

show ip dhcp lease

Use the **show ip dhcp lease** command to display all Dynamic Host Client Protocol version 4 (DHCPv4) lease information for interfaces that have dynamically assigned IPv4 addresses. Variations of this command include:

show ip dhcp lease
show ip dhcp lease *<interface>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Optional. Displays the information for the specified interface type. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip dhcp lease ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release 18.3	Command syntax was changed to remove the hyphen and the **client** keyword for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **client** keyword for Adtran voice products.
Release R11.7.0	Command was expanded to include the Ethernet in the first mile (EFM) group interface.

Usage Examples

The following is sample output from the **show ip dhcp lease** command:

```
>enable
#show ip dhcp lease
Interface: ethernet 0/1
Temp IP address: 10.100.23.64 Mask: 0.0.0.0
   DHCP Lease server: 10.100.23.207 State: Bound (3)
   Lease: 120 seconds
Temp default gateway address: 0.0.0.0
   Client-ID: N/A
```

show ip ffe

Use the **show ip ffe** command to display current Internet Protocol version 4 (IPv4) RapidRoute fast forwarding engine (FFE) entries. Variations of this command include:

show ip ffe

show ip ffe destination <*ipv4 address*>
show ip ffe destination <*ipv4 address*> **egress** <*interface*>
show ip ffe destination <*ipv4 address*> **egress ipsec** <*rapidroute interface ID*>
show ip ffe destination <*ipv4 address*> **egress system-control-evc**
show ip ffe destination <*ipv4 address*> **egress system-management-evc**

show ip ffe destination <*ipv4 address*> **ingress** <*interface*>
show ip ffe destination <*ipv4 address*> **ingress ipsec** <*rapidroute interface ID*>
show ip ffe destination <*ipv4 address*> **ingress system-control-evc**
show ip ffe destination <*ipv4 address*> **ingress system-management-evc**

show ip ffe destination-port <*port*>
show ip ffe destination-port <*port*> **egress** <*interface*>
show ip ffe destination-port <*port*> **egress ipsec** <*rapidroute interface ID*>
show ip ffe destination-port <*port*> **egress system-control-evc**
show ip ffe destination-port <*port*> **egress system-management-evc**

show ip ffe destination-port <*port*> **ingress** <*interface*>
show ip ffe destination-port <*port*> **ingress ipsec** <*rapidroute interface ID*>
show ip ffe destination-port <*port*> **ingress system-control-evc**
show ip ffe destination-port <*port*> **ingress system-management-evc**

show ip ffe details
show ip ffe details egress <*interface*>
show ip ffe details egress ipsec <*rapidroute interface ID*>
show ip ffe details egress system-control-evc
show ip ffe details egress system-management-evc

show ip ffe details ingress <*interface*>
show ip ffe details ingress ipsec <*rapidroute interface ID*>
show ip ffe details ingress system-control-evc
show ip ffe details ingress system-management-evc

show ip ffe egress <*interface*>
show ip ffe egress <*interface*> **destination** <*ipv4 address*>
show ip ffe egress <*interface*> **destination-port** <*port*>
show ip ffe egress <*interface*> **details**
show ip ffe egress <*interface*> **icmp-type** <*type*>

show ip ffe wildcard
show ip ffe wildcard interface <*interface*>
show ip ffe wildcard system-control-evc
show ip ffe wildcard system-management-evc

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

destination <*ipv4 address*>	Optional. Filters output by a destination IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
destination-port <*port*>	Optional. Filters output by destination Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) port. Ports range from **0** to **65535**.
details	Optional. Displays detailed information. Refer to the Functional Notes for more information about using the **details** keyword.

egress <*interface*> Optional. Displays RapidRoute entries for an egress interface. Specify an interface in the format <*interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | group id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface, use **efm-group 1**. Type **show ip ffe egress ?** to display a complete list of valid interfaces.

egress ipsec <*rapidroute interface ID*> Optional. Displays RapidRoute entries that come from an Internet Protocol security (IPsec) security association (SA) on a specified RapidRoute interface. RapidRoute interface identifiers range from **1** to **16777215**.

icmp-type <*type*> Optional. Displays RapidRoute entries using a specific Internet Control Message Protocol (ICMP) type. There are three types of ICMP to choose from:

- **echo** Displays ICMP echo RapidRoute entries.
- **reply** Displays ICMP reply RapidRoute entries.
- **0** to **255** Displays other ICMP types.

ingress <*interface*> Optional. Displays RapidRoute entries for an ingress interface. Specify an interface in the format <*interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | group id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface, use **efm-group 1**. Type **show ip ffe ingress ?** to display a complete list of valid interfaces.

ingress ipsec <*rapidroute interface ID*> Optional. Displays RapidRoute entries that go to an IPsec SA on a specified RapidRoute interface. RapidRoute interface identifiers range from **1** to **16777215**.

peak Optional. Displays the current and peak count of RapidRoute sessions. Information is displayed for each eligible interface and the global values.

history Optional. Displays a graphical presentation of the peak global RapidRoute cont per second for the last 60 seconds. Additionally displays the peak and average global RapidRoute count per minute for the last 60 minutes, as well as the peak and average global RapidRoute count per hour for the last 72 hours.

protocol <*protocol*> Optional. Displays RapidRoute entries that use a specified protocol. Protocols can be specified by selecting one of the following:

- **ah** Displays Authentication Header (AH) Protocol RapidRoute entries.
- **esp** Displays Encapsulating Security Payload (ESP)

		Protocol RapidRoute entries.
	fragment	Displays fragmented (FRAG) RapidRoute entries.
	gre	Displays Generic Route Encapsulation (GRE) Protocol RapidRoute entries.
	icmp	Displays ICMP RapidRoute entries.
	tcp	Displays TCP RapidRoute entries.
	udp	Displays UDP RapidRoute entries.
	0 to **255**	Displays other protocol types.
source <*ipv4 address*>		Optional. Displays RapidRoute entries for a specified source IPv4 address. IPv4 addresses should be expressed in decimal dotted notation (for example, **10.10.10.1**).
source-port <*port*>		Optional. Displays RapidRoute entries for a specified TCP or UDP source port. Ports range from **0** to **65535**.
system-control-evc		Optional. Displays RapidRoute entries for the system control Ethernet virtual connection (EVC).
system-management-evc		Optional. Displays RapidRoute entries for the system management EVC.
type <*type*>		Optional. Displays RapidRoute entries of a specific type. Specified types include one of the following:
	ineligible	Displays only ineligible RapidRoute entries.
	rejected	Displays only rejected RapidRoute entries.
	valid	Displays only valid RapidRoute entries.
wildcard		Optional. Displays wildcards for each IP interface.
interface <*interface*>		Optional. Limits the output to the specified interface. Interfaces are specified in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | group id]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface, use **efm-group 1**. Type **show ip ffe wildcard interface ?** to display a complete list of valid interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.6	Command was expanded to include the **ipsec** and **gre** parameters.

Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release R10.5.0	Command was expanded so that the **ipsec** parameter can be used to filter the command output.
Release R10.10.0	Command was expanded to include the system control and system management EVCs.
Release R11.2.0	Command was expanded to include high level data link control (HDLC) interface.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group interface.
Release R11.4.0	Command was expanded to include the **fragment** option for the **protocol** parameter.
Release R11.10.0	Command was expanded to include the **peak** and **wildcard** parameters.
Release R13.7.0	Command was expanded to include the virtual local area network (VLAN) interface.

Functional Notes

The **show ip ffe** command can be further filtered by adding any combination of the following parameters:

destination <*ipv4 address*>
destination-port <*port*>
details
egress <*interface*>
egress ipsec <*rapidroute interface ID*>
icmp-type <*type*>
ingress <*interface*>
ingress ipsec <*rapidroute interface ID*>
ipsec <*rapidroute interface ID*>
protocol <*protocol*>
source <*ipv4 address*>
source-port <*port*>
type <*type*>

For example, the **destination** <*ipv4 address*> and **source** <*ipv4 address*> parameters can be used in conjunction with one another. In this case, the command would look like as follows:

#show ip ffe destination 10.10.10.3 source 10.10.10.1

These parameters can be combined in any order and as many times as is necessary to get the desired output.

*The **detail** keyword must be the last keyword in the command. For example, **show ip ffe destination** <ipv4 address> **egress** <interface> **source-port** <port> **details** is acceptable, but **show ip ffe destination** <ipv4 address> **details egress** <interface> is not.*

Data for the **peak history** parameters is presented as a percentage of the value configured with the command *ip ffe max-entries <value> on page 1364*. Changing the **ip ffe max-entries** value clears the related FFE peak information.

Usage Examples

The following is sample output from the **show ip ffe** command:

```
>enable
#show ip ffe
Timeout     TCP     UDP     ICMP    AH      ESP     GRE     Other
Age:        30m0s   30m0s   30m0s   30m0s   30m0s   30m0s   30m0s
Inactive:   15s     15s     15s     15s     15s     15s     15s

```

show ip ffe summary

Use the **show ip ffe summary** command to display a summary of all the current Internet Protocol version 4 (IPv4) RapidRoute fast forwarding engine (FFE) entries.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip ffe summary** command:

```
>enable
#show ip ffe summary
Ingress    MaxEntries   Entries   Hits   Misses   Drops
eth 0/1    4096         1         0      56       0
global     16384        1         0      56       0
```

show ip flow

Use the **show ip flow** command to display information regarding the configuration of integrated traffic monitoring (ITM) on your AOS product. Variations of this command include:

show ip flow cache
show ip flow export
show ip flow interface

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

cache	Displays a summary of the current state of the cache of nonexpired traffic flows.
export	Displays information on export packets sent to a destination.
interface	Displays the ITM configuration of each interface on the router.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip flow export** command:

#show ip flow export

```
Traffic Flow export is ENABLED
    Version: 9
    Export Destinations
        10.22.16.132: 9991
            vrf BLUE
            source ppp 1
        10.5.22.203: 30000
    11 flows exported in 8 udp datagrams
    0 flows failed to export
```

The following is sample output from the **show ip flow cache** command:

```
#show ip flow cache
IP Traffic Flow Cache
    Size: 682/4096 entries
    8206 total entries added
    95545 aging polls, last aging poll occurred 3 seconds ago
```

The following is sample output from an AOS product with an Ethernet interface and a point-to-point interface configured for ITM:

```
#show ip flow interface
eth 0/1
    ip flow ingress
ppp 1
    ip flow ingress
    ip flow egress
```

show ip flow top-talkers

Use the **show ip flow top-talkers** command to view information pertinent to integrated traffic monitoring (ITM) Top Talker configuration and to reveal possible configuration problems. Variations of this command include:

show ip flow top-talkers
show ip flow top-talkers day
show ip flow top-talkers day detail
show ip flow top-talkers hour
show ip flow top-talkers hour detail
show ip flow top-talkers port
show ip flow top-talkers port detail

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines after.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

day	Optional. Specifies the display of Top Talker data for the current 24-hour period.
hour	Optional. Specifies the display of Top Talker data for the current hour.
port	Optional. Specifies the display of Top Talker monitored port traffic for the current interval.
detail	Optional. Specifies the display of information for previous and current intervals.

Default Values

No default values are necessary for this command.

Command History

Release 17.1	Command was introduced.

Usage Examples

The following is sample output from the **show ip flow top-talkers** command:

#show ip flow top-talkers

Current Interval Top Talkers:
1:00 PM to 1:15 PM

Top Traffic Sources:		Top Traffic Destinations:	
IP Address	Packets	IP Address	Packets
10.100.43.254	1451	10.22.162.3	735
10.100.43.161	860	10.22.166.222	707
10.22.160.253	384	10.22.160.7	407
10.100.43.200	292	224.0.0.6	393
10.22.165.17	222	10.22.130.6	391

Top 5 talkers shown. 742 flows processed.

show ip igmp groups

Use the **show ip igmp groups** command to display the multicast groups that have been registered by directly connected receivers using Internet Group Management Protocol (IGMP). If no multicast group IP address is specified, all groups are shown with this command. Variations of this command include:

show ip igmp groups
show ip igmp groups *<multicast address>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<multicast address>	Optional. Displays the IP address of a multicast group. The multicast group IP address range is **244.0.0.0** to **239.255.255.255** or **224.0.0.0 /4**.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from this command:

```
>enable
#show ip igmp groups
IGMP Connected Group Membership
Group Address   Interface       Uptime    Expires   Last Reported
172.0.1.50      Loopback100     00:42:57  00:02:50  172.23.23.1
172.1.1.1       Ethernet0/1     00:05:26  00:02:51  1.1.1.2
172.1.1.1       Loopback100     00:42:57  00:02:51  172.23.23.1
```

show ip igmp interface

Use the **show ip igmp interface** command to display multicast-related information per-interface. If no interface is specified, this command shows information for all interfaces. Variations of this command include:

show ip igmp interface
show ip igmp interface <*interface*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*interface*>	Optional. Displays information for a specific interface type. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Enter the **show ip igmp interface ?** command for a complete list of interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Usage Examples

The following example is sample output from the **show ip igmp interface** command:

```
>enable
#show ip igmp interface
eth 0/1 is UP
 Ip Address is 10.22.120.47, netmask is 255.255.255.0
 IGMP is enabled on interface
 Current IGMP version is 2
 IGMP query interval is 60 seconds
 IGMP querier timeout is 120 seconds
 IGMP max query response time is 10 seconds
 Last member query count is 2
 Last member query response interval is 1000 ms
 IGMP activity: 548 joins, 0 leaves
 IGMP querying router is 0.0.0.0
 IGMP helper address is disabled
```

show ip igmp snooping

Use the **show ip igmp snooping** command to display Internet Group Management Protocol (IGMP) snooping information. Variations of this command include:

show ip igmp snooping
show ip igmp snooping mrouter
show ip igmp snooping mrouter vlan <*vlan id*>
show ip igmp snooping vlan
show ip igmp snooping vlan <*vlan id*>

Global IGMP snooping overrides the virtual local area network (VLAN) IGMP snooping. If global snooping is disabled, you cannot enable VLAN IGMP snooping. If global snooping is enabled, you can enable or disable VLAN IGMP snooping. Refer to *ip igmp snooping on page 1407* *for more information.*

The output of all ***show*** *commands can be limited by appending the following modifiers to the end of the command:* **|** ***begin*** <*text*>, **|** ***exclude*** <*text*>, *and* **|** ***include*** <*text*>. *The* ***include*** *modifier limits output to lines that contain the specified text, the* ***exclude*** *modifier excludes any lines with the specified text, and the* ***begin*** *modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the *Enable Mode Command Set on page 94*.

Syntax Description

mrouter	Optional. Displays the ports associated with multicast routers.
vlan	Optional. Displays whether IGMP snooping is enabled or disabled for all VLANs.
vlan <*vlan id*>	Optional. Displays whether IGMP snooping is enabled or disabled for a particular VLAN.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip igmp snooping vlan** command:

```
>enable
#show ip igmp snooping vlan 1
Vlan 1: IGMP snooping is enabled on this VLAN
```

The following is sample output from the **show ip igmp snooping mrouter vlan** command:

```
>enable
#show ip igmp snooping mrouter vlan 200
VLAN            Ports
----------------+ ---------------------------------
 200            Gi0/2(static)
```

show ip interfaces

Use the **show ip interfaces** command to display the status information for all Internet Protocol version 4 (IPv4) interfaces (or a specific IPv4 interface). Variations of this command include:

show ip interfaces
show ip interfaces *<ipv4 interface>*
show ip interfaces *<ipv4 interface>* **brief**
show ip interfaces efm-group *<group id>*
show ip interfaces mef-ethernet *<slot/port>*
show ip interfaces system-control-evc
show ip interfaces system-management-evc

*To view secondary IP addresses, use the **show running-config** command.*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv4 interface>	Optional. Displays status information for a specific IPv4 interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip interfaces ?** for a complete list of applicable interfaces. If no interface is specified, status information for all interfaces is displayed.
efm-group *<group id>*	Specifies an Ethernet in the first mile (EFM) group ID. Range is **1** to **1024**.
mef-ethernet *<slot/port>*	Specifies the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Displays status information for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays status information for the system management EVC.
brief	Optional. Displays an abbreviated version of interface statistics for all IPv4 interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 11.1	Demand interface was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release R10.4.0	Command was expanded to include the virtual local area network (VLAN) interface.
Release R10.10.0	Command was expanded to include the system control and system management EVCs.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group and Metro Ethernet Forum (MEF) Ethernet interface.

Usage Examples

The following is sample output of the **show ip interfaces** command, and displays information for IPv4 interfaces:

```
>enable
#show ip interfaces
eth 0/1 is UP, line protocol is UP
 Ip address is 10.10.10.1
 Netmask is 255.255.255.0
 MTU is 1500
 Fastcaching is Enabled
 RIP Authentication is Disabled
 RIP Tx uses global version value
```

show ip local policy

Use the **show ip local policy** command to display information about the route-map used for local policy-based routing. Variations of this command include the following:

show ip local policy
show ip local policy vrf <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

vrf <*name*>	Optional. Displays information for only the specified virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output (just for the default VRF) from this command:

```
>enable
#show ip local policy
Local policy routing is enabled, using route-map SAMPLE_RTEMAP
route-map SAMPLE_RTEMAP, permit, sequence 1
 Match clauses:
   ip address (access-lists): SAMPLE_ACL
 Set clauses:
 BGP Filtering matches: 0 routes
 Policy routing matches: 0 packets 0 bytes
 Redistribution Filtering matches: 0 routes
```

show ip nhrp

Use the **show ip nhrp** command to display Next Hop Resolution Protocol (NHRP) cache entries. Variations of this command include:

show ip nhrp
show ip nhrp brief
show ip nhrp interface tunnel <*number*>
show ip nhrp interface tunnel <*number*> **brief**
show ip nhrp <*ip address*>
show ip nhrp <*ip address*> **brief**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

brief	Optional. Shortens the output for each entry to fit on a single line.
interface tunnel <*number*>	Optional. Limits entries to only those that correspond to the specified interface.
<*ip address*>	Optional. Limits entries to those with the specified private tunnel IP address. Express IP addresses in dotted decimal notation; for example, **10.10.10.1**.

Command History

Release R11.9.0	Command was introduced.

Usage Examples

The following example displays all NHRP cache entries:

```
>enable
#show ip nhrp
Interface tunnel 1:
    Protocol address: 10.10.10.1/32,
    Type: static, Flags: unique,
    NMBA Address: 1.1.1.1
    Created: 33:44:55, Expires: Never
```

show ip mroute

Use the **show ip mroute** command to display IP multicasting routing table information. Variations of this command include:

show ip mroute
show ip mroute all
show ip mroute *<ip address>*
show ip mroute *<interface>*
show ip mroute summary

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

all	Optional. Displays all multicast routes, including those not used to forward multicast traffic.
<ip address>	Optional. Displays IP address of a multicast group. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<interface>	Optional. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip mroute ?** for a complete list of interfaces.
summary	Optional. Displays a single-line summary for each entry in the IP multicast routing table.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 11.1	The **all** parameter was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Usage Examples

The following is sample output from the **show ip mroute all** command:

```
>enable
#show ip mroute all
IP Multicast Routing Table
Flags: S - Sparse, C - Connected, P - Pruned, J - Join SPT, T - SPT-bit Set,
F - Register, R - RP-bit Set
Timers: Uptime/Expires
(*, 225.1.0.1), 01:17:34/00:03:25, RP 192.168.0.254, Flags: SC
 Forwarding Entry: Yes
 Incoming interface: tunnel 2, RPF nbr 172.16.2.10
 Outgoing interface list:
   eth 0/1, Forward, 01:17:34/00:03:25
```

show ip nhrp nhs

Use the **show ip nhrp nhs** command to display a list of configured next-hop server (NHS) servers and their statuses for each Next Hop Resolution Protocol (NHRP) interface. Variations of this command include:

show ip nhrp nhs
show ip nhrp interface tunnel <*number*> **nhs**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interface tunnel <*number*>	Optional. Specifies that output is limited to a single tunnel interface.

Default Values

No default values are necessary for this command.

Command History

Release R11.7.0	Command was introduced.

Usage Examples

The following example displays the NHS servers and their statuses for all configured NHRP interfaces:

```
>enable
#show ip nhrp nhs
INTERFACE          NHS          STATUS
tunnel 4           1.1.1.2      UP
tunnel 5           5.5.5.5      DOWN
```

show ip nhrp traffic

Use the **show ip nhrp traffic** command to display the Next Hop Resolution Protocol (NHRP) traffic for all tunnel interfaces. Variations of this command include:

show ip nhrp traffic
show ip nhrp interface tunnel <*number*> **traffic**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

interface tunnel <*number*>	Optional. Specifies that output is limited to a single tunnel interface.

Default Values

No default values are necessary for this command.

Command History

Release R11.7.0	Command was introduced.

Usage Examples

The following example displays NHRP traffic statistics for the tunnel interface **1**:

```
>enable
#show ip nhrp interface tunnel 1 traffic
Interface tunnel 1:
    Sent: 1234567890 Total
          1234567890 Resolution Requests Resolution Replies:

show ip ospf

Use the **show ip ospf** command to display general information regarding Open Shortest Path First version 2 (OSPFv2) processes. Variations of this command include:

show ip ospf
show ip ospf *<process id>*

> NOTE *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the *<process id>* parameter.

Usage Examples

The following is sample output from the **show ip ospf** command:

```
>enable
#show ip ospf
Summary of OSPF Process with ID: 192.2.72.101
 Supports only single Type Of Service routes (TOS 0)
 SPF delay timer: 5 seconds, Hold time between SPFs: 10 seconds
 LSA interval: 240 seconds
 Number of external LSAs: 0, Checksum Sum: 0x0
 Number of areas: 0, normal: 0, stub: 0, NSSA: 0
```

show ip ospf database

Use the **show ip ospf database** command to display information from the Open Shortest Path First version 2 (OSPFv2) database regarding a specific router. There are several variations of this command that can be used to obtain information about different OSPF link state advertisements. The variations are shown below:

show ip ospf database
show ip ospf database adv-router *<router id>*
show ip ospf database database-summary
show ip ospf database self-originate
show ip ospf *<process id>* **database**
show ip ospf *<process id>* **database adv-router** *<router id>*
show ip ospf *<process id>* **database database-summary**
show ip ospf *<process id>* **database self-originate**
show ip ospf *<process id>* *<area id>* **database**
show ip ospf *<process id>* *<area id>* **database adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database database-summary**
show ip ospf *<process id>* *<area id>* **database self-originate**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
database-summary	Optional. Displays a simplified list of LSAs for the specified area.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Release R11.3.0	Command was expanded to include the <*process id*> and **self-originate** parameters.

Usage Examples

The following example shows the database link state summary for all areas:

>**enable**
#show ip ospf 61 database
OSPF router with ID: 9.8.8.1 (Process ID 61, VRF RED)

Router Link States, Area 0

Adv Router	Age	Seq #	Checksum	Link count	Bits
9.8.8.1	1705	0x80000093	0x065E	1	None
192.168.120.200	895	0x80000087	0x6271	1	B

Net Link States, Area 0

Adv Router	Age	Seq #	Checksum	Rtr Count
192.168.120.2	895	0x80000081	0x0643	2

Summary Net Link States, Area 0

Adv Router	Age	Seq #	Checksum	Prefix/Link ID
9.8.8.1	31	0x80000091	0x0F99	9.8.8.1
192.168.120.200	895	0x80000081	0xDE9C	192.168.120.0

Router Link States, Area 1

Adv Router	Age	Seq #	Checksum	Link count	Bits
9.8.8.1	1769	0x80000095	0xE95A	2	None

Summary Net Link States, Area 1

Adv Router	Age	Seq #	Checksum	Prefix/Link ID
9.8.8.1	31	0x80000091	0x4ED6	10.24.106.0
9.8.8.1	600	0x80000090	0xB11E	192.168.120.0
9.8.8.1	600	0x80000090	0x4015	200.200.200.2

Type 5 AS External Net Link States

Adv Router	Age	Seq #	Checksum	Prefix/Link ID
9.8.8.1	670	0x80000091	0x69CA	0.0.0.0
9.8.8.1	30	0x80000091	0xBBDA	10.24.204.128

show ip ospf database asbr-summary

Use the **show ip ospf database asbr-summary** command to display information from the Open Shortest Path First version 2 (OSPFv2) database regarding a specific router. There are several variations of this command that can be used to obtain information about different OSPF link state advertisements. The variations are shown below:

show ip ospf database asbr-summary
show ip ospf database asbr-summary <*link-state id*>
show ip ospf database asbr-summary <*link-state id*> **adv-router** <*router id*>
show ip ospf database asbr-summary <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf database asbr-summary <*link-state id*> **internal**
show ip ospf database asbr-summary <*link-state id*> **self-originate**
show ip ospf database asbr-summary <*link-state id*> **self-originate internal**
show ip ospf database asbr-summary adv-router <*router id*>
show ip ospf database asbr-summary adv-router <*router id*> **internal**
show ip ospf database asbr-summary internal
show ip ospf database asbr-summary self-originate
show ip ospf database asbr-summary self-originate internal
show ip ospf <*process id*> **database asbr-summary**
show ip ospf <*process id*> **database asbr-summary** <*link-state id*>
show ip ospf <*process id*> **database asbr-summary** <*link-state id*> **adv-router** <*router id*>
show ip ospf <*process id*> **database asbr-summary** <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf <*process id*> **database asbr-summary** <*link-state id*> **internal**
show ip ospf <*process id*> **database asbr-summary** <*link-state id*> **self-originate**
show ip ospf <*process id*> **database asbr-summary** <*link-state id*> **self-originate internal**
show ip ospf <*process id*> **database asbr-summary adv-router** <*router id*>
show ip ospf <*process id*> **database asbr-summary adv-router** <*router id*> **internal**
show ip ospf <*process id*> **database asbr-summary internal**
show ip ospf <*process id*> **database asbr-summary self-originate**
show ip ospf <*process id*> **database asbr-summary self-originate internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary**
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*>
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*> **adv-router** <*router id*>
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*> **internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*> **self-originate**
show ip ospf <*process id*> <*area id*> **database asbr-summary** <*link-state id*> **self-originate internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary adv-router** <*router id*>
show ip ospf <*process id*> <*area id*> **database asbr-summary adv-router** <*router id*> **internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary internal**
show ip ospf <*process id*> <*area id*> **database asbr-summary self-originate**
show ip ospf <*process id*> <*area id*> **database asbr-summary self-originate internal**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<link-state id>	Optional. Displays information from a specific link state ID. The value defined in this field is tied to the advertisement's loop start (LS) type.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
internal	Optional. Displays the shortest path first (SPF) calculation results for the LSAs and whether the LAS was used in route calculation.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release R11.3.0	Command was introduced.

Functional Notes

The link state ID differs depending on whether the LSA in question describes a network or a router.

If describing a network, the link state ID is one of the following:

- The network's IP address. This is true for type 3 summary link advertisements and in autonomous system external link advertisements.
- An address obtained from the link state ID. If the network link advertisement's link state ID is masked with the network's subnet mask, this will yield the network's IP address.

If describing a router, the link state ID is always the router's OSPF router ID.

Usage Examples

The following is sample output from the **show ip ospf database asbr-summary** command:

```
>enable
#show ip ospf 1 0 database asbr-summary
```

OSPF router with ID: 35.35.35.35 (Process ID 1)

Summary ASB Link States, Area 0

Link State age: 153
Link State type: Summary-ASB-LSA (0x0004)
Link State ID: 2.2.2.2
Advertising Router: 92.92.92.92
Sequence Number: 0x800003CC
Checksum: 0xA170
Options:
Length: 28
Metric: 2

show ip ospf database external

Use the **show ip ospf external** command to display Open Shortest Path First version 2 (OSPFv2) information for external link state advertisements (LSAs). Variations of this command include:

show ip ospf database external
show ip ospf database external *<link-state id>*
show ip ospf database external *<link-state id>* **adv-router** *<router id>*
show ip ospf database external *<link-state id>* **self-originate**
show ip ospf database external adv-router *<router id>*
show ip ospf database external self-originate
show ip ospf *<process id>* **database external**
show ip ospf *<process id>* **database external** *<link-state id>*
show ip ospf *<process id>* **database external** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* **database external** *<link-state id>* **self-originate**
show ip ospf *<process id>* **database external adv-router** *<router id>*
show ip ospf *<process id>* **database external self-originate**
show ip ospf *<process id>* *<area id>* **database external**
show ip ospf *<process id>* *<area id>* **database external** *<link-state id>*
show ip ospf *<process id>* *<area id>* **database external** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database external** *<link-state id>* **self-originate**
show ip ospf *<process id>* *<area id>* **database external adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database external self-originate**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<link-state id>	Optional. Displays information from a specific link state ID. The value defined in this field is tied to the advertisement's loop start (LS) type.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the <*process id*>, and **self-originate** parameters.

Functional Notes

The link state ID differs depending on whether the LSA in question describes a network or a router.

If describing a network, the link state ID is one of the following:

- The network's IP address. This is true for type 3 summary link advertisements and in autonomous system external link advertisements.
- An address obtained from the link state ID. If the network link advertisement's link state ID is masked with the network's subnet mask, this will yield the network's IP address.

If describing a router, the link state ID is always the router's OSPF router ID.

Usage Examples

The following is sample output from the **show ip ospf database external** command:

```
>enable
#show ip ospf 61 database external

    OSPF router with ID: 9.8.8.1 (Process ID 61, VRF RED)
            Type 5 AS External Net Link States
                Link State age: 1626
                Link State type: AS External (0x0005)
                Link State ID: 0.0.0.0
                Advertising Router: 9.8.8.1
                Sequence Number: 0x80000093
                Checksum: 0x65CC
                Options: E
                Length: 36
    Network Mask: 255.255.255.255
                Metric Type: 1 (Comparable directly to link state metric)
                Metric: 22222
                Forward Address: 10.24.106.2
                External Route Tag: 0x00000000
```

show ip ospf database network

Use the **show ip ospf database network** command to display Open Shortest Path First version 2 (OSPFv2) information for network links state advertisements (LSAs). Variations of this command include:

show ip ospf database network
show ip ospf database network *<link-state id>*
show ip ospf database network *<link-state id>* **adv-router** *<router id>*
show ip ospf database network *<link-state id>* **self-originate**
show ip ospf database network adv-router *<router id>*
show ip ospf database network self-originate
show ip ospf *<process id>* **database network**
show ip ospf *<process id>* **database network** *<link-state id>*
show ip ospf *<process id>* **database network** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* **database network** *<link-state id>* **self-originate**
show ip ospf *<process id>* **database network adv-router** *<router id>*
show ip ospf *<process id>* **database network self-originate**
show ip ospf *<process id>* *<area id>* **database network**
show ip ospf *<process id>* *<area id>* **database network** *<link-state id>*
show ip ospf *<process id>* *<area id>* **database network** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database network** *<link-state id>* **self-originate**
show ip ospf *<process id>* *<area id>* **database network adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database network self-originate**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<link-state id>	Optional. Displays information from a specific link state ID. The value defined in this field is tied to the advertisement's loop start (LS) type.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the <*process id*>, and **self-originate** parameters.

Functional Notes

The link state ID differs depending on whether the LSA in question describes a network or a router.

If describing a network, the link state ID is one of the following:

- The network's IP address. This is true for type 3 summary link advertisements and in autonomous system external link advertisements.
- An address obtained from the link state ID. If the network link advertisement's link state ID is masked with the network's subnet mask, this will yield the network's IP address.

If describing a router, the link state ID is always the router's OSPF router ID.

Usage Examples

The following is sample output from the **show ip ospf database network** command:

```
>enable
#show ip ospf 61 database network
  OSPF router with ID: 9.8.8.1 (Process ID 61, VRF RED)

    Network Link States, Area 0

      Link State age: 60
      Link State type: Network-LSA (0x0002)
      Link State ID: 10.24.106.10
      Advertising Router: 9.8.8.1
      Sequence Number: 0x80000002
      Checksum: 0x3282
      Options: E
      Length: 32
        Network Mask: 255.255.255.0
        Number of Attached Routers: 2
          Attached Router: 9.8.8.1
          Attached Router: 4.4.4.4
```

show ip ospf database router

Use the **show ip ospf database router** command to display Open Shortest Path First version 2 (OSPFv2) information for router link state advertisements (LSAs). Variations of this command include:

show ip ospf database router
show ip ospf database router <*link-state id*>
show ip ospf database router <*link-state id*> **adv-router** <*router id*>
show ip ospf database router <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf database router <*link-state id*> **internal**
show ip ospf database router <*link-state id*> **self-originate**
show ip ospf database router <*link-state id*> **self-originate internal**
show ip ospf database router adv-router <*router id*>
show ip ospf database router adv-router <*router id*> **internal**
show ip ospf database router internal
show ip ospf database router self-originate
show ip ospf database router self-originate internal
show ip ospf <*process id*> **database router**
show ip ospf <*process id*> **database router** <*link-state id*>
show ip ospf <*process id*> **database router** <*link-state id*> **adv-router** <*router id*>
show ip ospf <*process id*> **database router** <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf <*process id*> **database router** <*link-state id*> **internal**
show ip ospf <*process id*> **database router** <*link-state id*> **self-originate**
show ip ospf <*process id*> **database router** <*link-state id*> **self-originate internal**
show ip ospf <*process id*> **database router adv-router** <*router id*>
show ip ospf <*process id*> **database router adv-router** <*router id*> **internal**
show ip ospf <*process id*> **database router internal**
show ip ospf <*process id*> **database router self-originate**
show ip ospf <*process id*> **database router self-originate internal**
show ip ospf <*process id*> <*area id*> **database router**
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*>
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*> **adv-router** <*router id*>
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*> **adv-router** <*router id*> **internal**
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*> **internal**
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*> **self-originate**
show ip ospf <*process id*> <*area id*> **database router** <*link-state id*> **self-originate internal**
show ip ospf <*process id*> <*area id*> **database router adv-router** <*router id*>
show ip ospf <*process id*> <*area id*> **database router adv-router** <*router id*> **internal**
show ip ospf <*process id*> <*area id*> **database router internal**
show ip ospf <*process id*> <*area id*> **database router self-originate**
show ip ospf <*process id*> <*area id*> **database router self-originate internal**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<link-state id>	Optional. Displays information from a specific link state ID. The value defined in this field is tied to the advertisement's loop start (LS) type.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
internal	Optional. Displays the shortest path first (SPF) calculation results for the LSAs and whether the LAS was used in route calculation.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the *<process id>*, **internal**, and **self-originate** parameters.

Functional Notes

The link state ID differs depending on whether the LSA in question describes a network or a router.

If describing a network, the link state ID is one of the following:

- The network's IP address. This is true for type 3 summary link advertisements and in autonomous system external link advertisements.
- An address obtained from the link state ID. If the network link advertisement's link state ID is masked with the network's subnet mask, this will yield the network's IP address.

If describing a router, the link state ID is always the router's OSPF router ID.

Usage Examples

The following is sample output from the **show ip ospf database router** command:

```
>enable
#show ip ospf 61 database router
OSPF router with ID: 9.8.8.1 (Process ID 61, VRF RED)

  Router Link States, Area 0

    Link State age: 350
    Link State type: Router-LSA (0x0001)
    Link State ID: 9.8.8.1
    Advertising Router: 9.8.8.1
    Sequence Number: 0x8000009D
    Checksum: 0x4210
    Options: E
    Length: 40
      Flags: Area Border Router, AS Boundary Router
      Number of Links: 1
        Link connected to: Transit network Link
          (Link ID} Designated Router address: 5.5.5.5
          (Link Data) Router Interface address: 9.8.8.1
          TOS 0 Metric: 1
```

show ip ospf database summary

Use the **show ip ospf database summary** command to display Open Shortest Path First version 2 (OSPFv2) information for summary link state advertisements (LSAs). Variations of this command include:

show ip ospf database summary
show ip ospf database summary *<link-state id>*
show ip ospf database summary *<link-state id>* **adv-router** *<router id>*
show ip ospf database summary *<link-state id>* **self-originate**
show ip ospf database summary adv-router *<router id>*
show ip ospf database summary self-originate
show ip ospf *<process id>* **database summary**
show ip ospf *<process id>* **database summary** *<link-state id>*
show ip ospf *<process id>* **database summary** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* **database summary** *<link-state id>* **self-originate**
show ip ospf *<process id>* **database summary adv-router** *<router id>*
show ip ospf *<process id>* **database summary self-originate**
show ip ospf *<process id>* *<area id>* **database summary**
show ip ospf *<process id>* *<area id>* **database summary** *<link-state id>*
show ip ospf *<process id>* *<area id>* **database summary** *<link-state id>* **adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database summary** *<link-state id>* **self-originate**
show ip ospf *<process id>* *<area id>* **database summary adv-router** *<router id>*
show ip ospf *<process id>* *<area id>* **database summary self-originate**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<area id>	Optional. Specifies an OSPF area ID. Refer to *network <ipv4 address> <wildcard mask> area <area id> on page 4133* for more information.
<link-state id>	Optional. Displays information from a specific link state ID. The value defined in this field is tied to the advertisement's loop start (LS) type.
<process id>	Optional. Limits the output of this command to a single OSPFv2 process. Valid range is **1** to **65535**.
adv-router *<router id>*	Optional. Optional. Limits the output of this command to a single specified advertising router.
self-originate	Optional. Displays information about LSAs originated from this router.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the <*process id*>, and **self-originate** parameters.

Functional Notes

The link state ID differs depending on whether the LSA in question describes a network or a router.

If describing a network, the link state ID is one of the following:

- The network's IP address. This is true for type 3 summary link advertisements and in autonomous system external link advertisements.
- An address obtained from the link state ID. If the network link advertisement's link state ID is masked with the network's subnet mask, this will yield the network's IP address.

If describing a router, the link state ID is always the router's OSPF router ID.

Usage Examples

The following is sample output from the **show ip ospf database summary** command:

```
>enable
#show ip ospf 61 database summary
  OSPF router with ID: 9.8.8.1 (Process ID 61, VRF RED)

    Summary Net Link States, Area 1

      Link State age: 689
      Link State type: Summary Network (0x0003)
      Link State ID: 10.24.106.0
      Advertising Router: 9.8.8.1
      Sequence Number: 0x80000009
      Checksum: 0x5F4E
      Options: E
      Length: 28
        Network Mask: /24
        Metric: 1
```

show ip ospf interface

Use the **show ip ospf interface** command to display Open Shortest Path First version 2 (OSPFv2) information for a specific interface. Variations of this command include:

show ip ospf interface
show ip ospf interface *<interface>*
show ip ospf interface system-control-evc
show ip ospf interface system-management-evc

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Optional. Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip ospf interface ?** for a complete list of applicable interfaces.
system-control-evc	Optional. Displays OSPF information for the system control Ethernet virtual connection (EVC)
system-management-evc	Optional. Displays OSPF information for the system management EVC.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the demand and Ethernet in the first mile (EFM) group interfaces and the **system-control-evc** and **system-management-evc** parameters.

Usage Examples

The following example shows OSPF information for the PPP 1 interface.

```
>enable
#show ip ospf 61 interface
eth 0/1.106 is UP, line protocol is UP
  IP address: 10.24.106.10 255.255.255.0, Area: 0
  Process ID 61, Router ID: 9.8.8.1, Network type: Broadcast, Cost: 1
  Transmit delay: 1, State: DR, Priority: 1
  Designated Router (ID): 9.8.8.1, Interface Address: 10.24.106.10
  Backup Designated Router (ID): 200.200.200.2, Interface Address: 10.24.106.2
  Timer intervals: Hello: 10, Dead: 40, Retransmit: 5
    Hello due in: 00:00:08
  Number of neighbors: 1, Adjacent neighbors: 1
    Adjacent with neighbor: 200.200.200.2 (Backup Designated Router)
loop 97 is UP, line protocol is UP
  IP address: 9.8.7.1 255.255.255.0, Area: 1
  Process ID 61, Router ID: 9.8.8.1, Network type: Point-to-point, Cost: 1
  Transmit delay: 1, State: PTPT, Priority: 1
  Timer intervals: Hello: 10, Dead: 40, Retransmit: 5
    Hello due in: 00:00:10
  Number of neighbors: 0, Adjacent neighbors: 0
loop 98 is UP, line protocol is UP
  IP address: 9.8.8.1 255.255.255.0, Area: 1
  Process ID 61, Router ID: 9.8.8.1, Network type: Point-to-point, Cost: 1
  Transmit delay: 1, State: PTPT, Priority: 1
  Timer intervals: Hello: 10, Dead: 40, Retransmit: 5
    Hello due in: 00:00:10
  Number of neighbors: 0, Adjacent neighbors: 0
```

show ip ospf neighbor

Use the **show ip ospf neighbor** command to display Open Shortest Path First version 2 (OSPFv2) neighbor information for a specific interface. Variations of this command include:

show ip ospf neighbor
show ip ospf neighbor detail
show ip ospf neighbor *<interface>*
show ip ospf neighbor *<interface>* **detail**
show ip ospf neighbor *<interface>* *<neighbor id>*
show ip ospf neighbor *<interface>* *<neighbor id>* **detail**
show ip ospf neighbor *<neighbor id>*
show ip ospf neighbor *<neighbor id>* **detail**
show ip ospf neighbor system-control-evc
show ip ospf neighbor system-control-evc detail
show ip ospf neighbor system-control-evc *<neighbor id>*
show ip ospf neighbor system-control-evc *<neighbor id>* **detail**
show ip ospf neighbor system-management-evc
show ip ospf neighbor system-management-evc detail
show ip ospf neighbor system-management-evc *<neighbor id>*
show ip ospf neighbor system-management-evc *<neighbor id>* **detail**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Optional. Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip ospf neighbor ?** for a complete list of applicable interfaces.
<neighbor id>	Optional. Specifies a specific neighbor's router ID.
detail	Optional. Displays detailed information on neighbors.
system-control-evc	Optional. Displays OSPF neighbor information for the system control Ethernet virtual connection (EVC)
system-management-evc	Optional. Displays OSPF neighbor information for the system management EVC.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R11.3.0	Command expanded to include the asynchronous transfer mode (ATM), bridged virtual interface (BVI), demand, Ethernet in the first mile (EFM) group, Gigabit Ethernet, and loopback interfaces. The command was also expanded to include the **system-control-evc** and **system-management-evc** parameters.

Usage Examples

The following example shows detailed information on the OSPF neighbors:

>**enable**
#show ip ospf neighbor
OSPF router with ID: 9.8.8.1, **Process ID 61, VRF RED**

Neighbor ID	Pri	State	Dead Time	Interface ID	Interface
204.204.204.61	1	FULL/BDR	00:00:38	20	eth 0/1.106

show ip ospf summary-address

Use the **show ip ospf summary-address** command to display a list of all summary address redistribution information for the system.Variations of this command include:

show ip ospf summary-address

show ip ospf *<process id>* **summary-address**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.3.0	Command was expanded to include the *<process id>* parameter.

Usage Examples

The following example displays the summary address redistribution information for process **61**:

```
>enable
#show ip ospf 61 summary-address
OSPF Summary Addresses, Process ID 61, VRF RED:
  8.7.0.0/255.255.0.0 Metric 11111, Type 1, advertise
```

show ip pim-sparse

Use the **show ip pim-sparse** command to display protocol-independent multicast (PIM) configuration information. Sparse mode or PIM-SM is a routing protocol used to establish and maintain the multicast distribution tree. Routers can participate in the shared tree (RPT) rooted at the rendezvous point (RP) router or the shortest path tree (SPT) rooted at a multicast source. PIM-SM also establishes both shared trees and SPTs. Variations of this command include:

show ip pim-sparse
show ip pim-sparse interfaces *<interface>*
show ip pim-sparse neighbor
show ip pim-sparse rp-map
show ip pim-sparse rp-set
show ip pim-sparse state
show ip pim-sparse traffic

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

interfaces *<interface>*	Optional. Displays PIM-SM configuration and status information for a specific interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show ip pim-sparse interface ?** to display a list of applicable interfaces.
neighbor	Optional. Displays neighbor adjacency information.
rp-map	Optional. Displays active group-to-RP mappings.
rp-set	Optional. Displays a list of statically configured RP candidates. The multicast group IP address is **224.0.0.0 /4** when no access group was applied to the **rp-address** command (refer to *rp-address <ip address> on page 4203*). Otherwise, it is the name of the access group.
state	Optional. Displays multicast route PIM state information.
traffic	Optional. Displays active PIM-SM control traffic statistics.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Usage Examples

The following is sample output from the **show ip pim-sparse** command:

```
>enable
#show ip pim-sparse
Global PIM Sparse Mode Settings
 Join/Prune interval: 60, SPT threshold: 1
```

The following is sample output from the **show ip pim-sparse interfaces** command:

```
>enable
#show ip pim-sparse interfaces
eth 0/1 is UP
  PIM Sparse
  DR: itself
  Local Address: 192.168.1.254
  Hello interval (sec): 30, Neighbor timeout (sec): 105
  Propagation delay (ms): 500, Override interval (ms): 2500

tunnel 1 is UP
  PIM Sparse
  DR: 172.16.1.10
  Local Address: 172.16.1.9
  Hello interval (sec): 30, Neighbor timeout (sec): 105
  Propagation delay (ms): 500, Override interval (ms): 2500

tunnel 2 is UP
  PIM Sparse
  DR: 172.16.2.10
  Local Address: 172.16.2.9
  Hello interval (sec): 30, Neighbor timeout (sec): 105
  Propagation delay (ms): 500, Override interval (ms): 2500
```

The following is sample output from the **show ip pim-sparse neighbor** command:

```
>enable
#show ip pim-sparse neighbor
```

```
Port          Neighbor        Holdtime(sec)   Age(sec)       Uptime(sec)
-------------------------------------------------------------------------------------------------
tunnel 1      172.16.1.10     105             19             241908
tunnel 2      172.16.2.10     105             23             241913
```

The following is sample output from the **show ip pim-sparse rp-map** command:

```
>enable
#show ip pim-sparse rp-map
Number of group-to-RP mappings: 5
Group address           RP address
-----------------------------------------------------
225.1.0.1               192.168.0.254
225.1.0.2               192.168.0.254
225.1.0.3               192.168.0.254
```

The following is sample output from the **show ip pim-sparse rp-set** command:

```
>enable
#show ip pim-sparse rp-set
Group address           Static-RP-address
-----------------------------------------------------------
224.0.0.0/4             192.168.0.254
MCAST_ACL_1             192.168.1.254
MCAST_ACL_2             192.168.2.254
MCAST_ACL_3             192.168.3.254
```

The following is sample output from the **show ip pim-sparse state** command:

```
>enable
#show ip pim-sparse state
PIM-SM State Table
Flags: S - Sparse, C - Connected, P - Pruned, J - Join SPT, T - SPT-bit Set,
F - Register, R - RP-bit Set
Timers: Uptime/Expires

(*, 225.1.0.1), 02:42:03/00:03:04, RP 192.168.0.254, Flags: SC
 Forwarding Entry: Yes
 Incoming interface: tunnel 2, RPF nbr 172.16.2.10

 Assert:            0         0
```

show ip policy

Use the **show ip policy** command to display the interfaces which have route maps configured. This command is used for troubleshooting policy-based routing.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip policy** command:

```
>enable
#show ip policy

Interface       Route-map
eth 0/1         ISP_A
eth 0/2         ISP_B
```

show ip policy-class

Use the **show ip policy-class** command to display the configured session limit and specific host IP addresses of all current sessions. Refer to *ip policy-class <ipv4 acp name> on page 1434* for information on configuring access policies.Variations of this command include:

show ip policy-class
show ip policy-class *<name>*
show ip policy-class host-sessions
show ip policy-class *<name>* **host-sessions**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

host-sessions	Optional. Displays specific host IP addresses of all current sessions.
<name>	Optional. Displays policy class information for a specific policy class.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 12.1	Command was expanded to include **host-sessions**.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip policy-class** command:

```
>enable
#show ip policy-class

Maximum policy-sessions: 17400
Policy-class “Private”:
 136 current sessions (5800 max)
 Entry 1 - allow list self self
 Entry 2 - nat source list wizard-ics interface ppp 1 overload
Policy-class “Public”:
 0 current sessions (5800 max)
```

The following is sample output from the **show ip policy-class host-sessions** command:

```
>enable
#show ip policy-class host-sessions

Policy-class “Private”:
 100 policy-sessions allowed per source address.

 Src IP Address   Sessions
 ---------------   --------
 192.168.1.100    1
 192.168.1.101    35
 192.168.1.121    100   (maximum allowed)

Policy-class “Public”:
 No limit for policy-sessions allowed per host.
```

The following is sample output from the **show ip policy-class** <*name*> **host-sessions** command for the policy class named **Private**:

```
>enable
#show ip policy-class Private host-sessions

Policy-class “Private”:
 100 policy-sessions allowed per source address.

 Src IP Address   Sessions
 ---------------   --------
 192.168.1.100    1
 192.168.1.101    35
 192.168.1.121    100   (maximum allowed)
```

show ip policy-sessions

Use the **show ip policy-sessions** command to display a list of current Internet Protocol version 4 (IPv4) access control policy (ACP) associations. Refer to *ip policy-class <ipv4 acp name> on page 1434* for information on configuring ACPs. Variations of this command include:

show ip policy-sessions
show ip policy-sessions *<ipv4 acp name>*
show ip policy-sessions *<ipv4 acp name>* **include-deleted**
show ip policy-sessions *<ipv4 acp name>* **timeline**
show ip policy-sessions any-vrf
show ip policy-sessions any-vrf include-deleted
show ip policy-sessions any-vrf timeline
show ip policy-sessions include-deleted
show ip policy-sessions pending
show ip policy-sessions timeline
show ip policy-sessions vrf *<name>*
show ip policy-sessions vrf *<name>* **include-deleted**
show ip policy-sessions vrf *<name>* **timeline**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv4 acp name>	Optional. Displays policy class associations for the specified IPv4 ACP.
include-deleted	Optional. Displays all IPv4 ACP firewall sessions, including active associations (through which the firewall is allowed to pass traffic), and associations flagged for deletion (through which the firewall is forbidden to pass traffic). Associations flagged for deletion will usually be freed within a few seconds of timeout or deletion, depending on packet congestion; servicing of packets is given priority. New traffic matching an association will create a new active association, provided the traffic still matches an ACP **allow** or network address translation (**NAT**) entry. (This parameter is only valid on the NetVanta 3200.)
timeline	Optional. Displays a timeline of IPv4 ACP firewall session creations and peak numbers of policy sessions per hour over the last 24 hours.
any-vrf	Optional. Displays information for all virtual routing and forwardings (VRFs), including the default.
pending	Optional. Displays any currently pending ACP sessions.

vrf <*name*>	Optional. Displays information only for the specified VRF. If a VRF is not specified, the default unnamed VRF is assumed.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 11.1	Command was expanded to include the **all** parameter.
Release 17.1	Command was expanded to include the parameters **vrf** and **include-deleted** (NetVanta 3200 only), as well as the modifiers **begin**, **exclude**, and **include**.
Release 17.5	Command was expanded to include the **timeline** parameter.
Release R10.1.0	Command was expanded to include the **pending** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show ip policy-sessions** command, and displays information for IPv4 ACPs:

```
>enable
#show ip policy-sessions
Protocol (TTL) [in crypto map] -> [out crypto map] Dest VRF, Dest policy-class
 Src IP Address        Src Port        Dest IP Address    Dst Port   NAT IP Address    NAT Port
-------------------------------------------------------------------------------------------------------------------------------
Policy class “Public”:
tcp (13)
 192.168.1.142         2621            192.168.19.2       1          10.10.10.1        3000
tcp (13)
 192.168.1.142         2622            192.168.19.2       2          10.10.10.1        3001
tcp (13)

```

show ip policy-stats

Use the **show ip policy-stats** command to display a list of current Internet Protocol version 4 (IPv4) access control policy (ACP) statistics. Refer to *ip policy-class <ipv4 acp name> on page 1434* for information on configuring IPv4 ACPs. Variations of this command include:

show ip policy-stats
show ip policy-stats *<ipv4 acp name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv4 acp name>	Optional. Displays policy class statistics for a specific IPv4 ACP.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays a list of current IPv4 ACP statistics:

>enable
#show ip policy-stats

show ip prefix-list

Use the **show ip prefix-list** command to display Border Gateway Protocol (BGP) prefix list information. Variations of this command include:

show ip prefix-list <*name*>
show ip prefix-list detail <*name*>
show ip prefix-list summary <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*name*>	Shows information for a specific prefix list.
detail	Optional. Shows a listing of the prefix list rules and their hit counts.
summary	Optional. Shows information about the entire prefix list.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

If the **show ip prefix-list** command is issued with no arguments, a listing of the prefix-list rules, but no hit count statistics, is displayed.

Usage Examples

The following example displays information about the prefix list **test**.

```
>enable
#show ip prefix-list test
ip prefix-list test: 4 entries
   seq 5 permit 0.0.0.0/0 ge 8 le 8
   seq 10 deny 0.0.0.0/0 ge 9 le 9
   seq 15 permit 0.0.0.0/0 ge 10 le 10
   seq 20 deny 0.0.0.0/0 ge 11
```

show ip protocols

Use the **show ip protocols** command to display IP routing protocol parameters and statistics. Variations of this command include:

show ip protocols
show ip protocols vrf <*name*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

vrf <*name*>	Optional. Displays IP routing protocol parameters and statistics for the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, statistics displayed are for the default (unnamed) VRF instance.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command was expanded to include the **vrf** <*name*> parameter.

Usage Examples

The following is sample output from the **show ip protocols** command:

```
>enable
#show ip protocols
Sending updates every 30 seconds, next due in 8 seconds
 Invalid after 180 seconds, hold down time is 120 seconds
 Redistributing: rip
 Default version control: send version 2, receive version 2
  Interface      Send Ver.      Rec Ver.
    eth 0/1          2              2
    ppp 1            2              2
 Routing for networks:
   1.1.1.0/24
```

show ip route

Use the **show ip route** command to display the contents of the Internet Protocol version 4 (IPv4) route table. Variations of this command include:

show ip route
show ip route *<ipv4 address>*
show ip route *<ipv4 address>* *<subnet mask>*
show ip route *<ipv4 address>* **longer-prefixes**
show ip route *<ipv4 address>* *<subnet mask>* **longer-prefixes**
show ip route bgp
show ip route bgp verbose
show ip route connected
show ip route ospf
show ip route ospf verbose
show ip route rip
show ip route rip verbose
show ip route static
show ip route static verbose
show ip route summary
show ip route summary realtime
show ip route table
show ip route vrf *<name>*
show ip route vrf *<name>* *<ipv4 address>*
show ip route vrf *<name>* *<ipv4 address>* *<subnet mask>*
show ip route vrf *<name>* *<ipv4 address>* **longer-prefixes**
show ip route vrf *<name>* *<ipv4 address>* *<subnet mask>* **longer-prefixes**
show ip route vrf *<name>* **bgp**
show ip route vrf *<name>* **connected**
show ip route vrf *<name>* **ospf**
show ip route vrf *<name>* **rip**
show ip route vrf *<name>* **static**
show ip route vrf *<name>* **summary**
show ip route vrf *<name>* **table**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<ipv4 address>	Optional. Specifies a valid IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<subnet mask>	Optional. Specifies the subnet mask that corresponds to a range of IPv4 addresses (network) or a specific host. Subnet masks can be expressed in dotted decimal notation (for example, **255.255.255.0**) or as a prefix length (for example, **/24**).
bgp	Optional. Displays only the IPv4 routes associated with Border Gateway Protocol (BGP).
connected	Optional. Displays only the IPv4 routes for directly connected networks.
longer-prefixes	Optional. Displays only the IPv4 routes matching the specified network.
ospf	Optional. Displays only the IPv4 routes associated with Open Shortest Path First version 2 (OSPFv2).
rip	Optional. Displays only the IPv4 routes that were dynamically learned through Routing Information Protocol (RIP).
static	Optional. Displays only the IPv4 routes that were statically entered.
summary	Optional. Displays a summary of all IPv4 route information.
summary realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
table	Optional. Displays a condensed version of the IPv4 route table.
verbose	Optional. Enables detailed messaging.
vrf *<name>*	Optional. Displays only the IPv4 routes for the specified virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 16.1	Expanded to include the **vrf** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A1	Command was expanded to include the **verbose** parameter.
Release 17.2	Command was enhanced to show the best route to the given IP address and the **longer-prefixes** parameter was added.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example shows how to display IPv4 routes learned via BGP. The values in brackets after a BGP route entry represent the entry's administrative distance and metric:

```
>enable
#show ip route bgp
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
       IA - OSPF inter area, N1 - OSPF NSSA external type 1
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1
       E2 - OSPF external type 2
Gateway of last resort is 10.15.43.17 to network 0.0.0.0
B    1.0.0.0/8 [30/0] via 10.15.43.17, fr 1.17
B    2.0.0.0/9 [30/0] via 10.15.43.17, fr 1.17
B    2.128.0.0/10 [30/0] via 10.15.43.17, fr 1.17
B    2.192.0.0/11 [30/0] via 10.15.43.17, fr 1.17
B    2.224.0.0/12 [30/0] via 10.15.43.17, fr 1.17
B    2.240.0.0/13 [30/0] via 10.15.43.17, fr 1.17
```

The following example shows output for the **show ip route vrf RED summary** command.

```
>enable
#show ip route vrf RED summary
Route Source    FIB       Local-RIB
Connected       16        16
Static          16        16
Other           31        31

Total           63        63
```

The following example shows how to display IPv4 routes learned in VRF **RED**. The values in brackets after a route entry represent the entry's administrative distance and metric:

```
>enable
#show ip route vrf RED
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
       IA - OSPF inter area, N1 - OSPF NSSA external type 1
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1
       E2 - OSPF external type 2
Gateway of last resort is 192.168.1.1 to network 0.0.0.0
S     0.0.0.0/0 [1/0] via 192.168.1.1, eth 0/2.301
C     192.168.1.0/24 is directly connected, eth 0/2.301
C     192.168.50.0/30 is directly connected, fr 1.16
C     192.168.50.1/32 is directly connected, fr 1.16
C     192.168.51.0/30 is directly connected, fr 2.16
C     192.168.54.0/30 is directly connected, ppp 1
C     192.168.55.0/30 is directly connected, hdlc 1
C     192.168.56.0/30 is directly connected, fr 11.16
S     192.168.101.0/24 [1/0] via 192.168.50.1, fr 1.16
S     192.168.102.0/24 [1/0] via 192.168.51.1, fr 2.16
S     192.168.106.0/24 [1/0] via 192.168.55.1, hdlc 1
S     192.168.107.0/24 [1/0] via 192.168.56.1, fr 11.16
S     192.168.109.0/24 [1/0] via 192.168.1.253, eth 0/2.301
```

The following example shows output for the **show ip route** command. The values in brackets after a route entry represent the entry's administrative distance and metric:

```
>enable
#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
       E1 - OSPF external type 1, E2 - OSPF external type 2
       IA - OSPF inter area

Gateway of last resort is 10.22.18.254 to network 0.0.0.0

S     0.0.0.0/0 [1/0] via 10.22.18.254, eth 0/1
S     10.22.16.0/24 [1/0] via 10.22.18.254, eth 0/1
S     10.22.17.0/24 [1/0] via 10.22.18.254, eth 0/1
C     10.22.18.0/24 is directly connected, eth 0/1
C     192.168.25.0/31 is directly connected, loop 1
C     192.168.26.1/32 is directly connected, loop 2
C     192.168.27.0/24 is directly connected, loop 3
C     192.168.249.0/24 is directly connected, eth 0/2
```

The following example shows output for the **show ip route** <*ipv4 address*> command. This data explains the resulting route a packet will be sent through.

>**enable**
#show ip route 10.22.16.16
Routing entry for 10.22.16.0/24
Known via “static”
Distance 1, metric 0, candidate default path
Routing Next Hop(s):
10.22.18.254, via eth 0/1
Route metric is 0

The following example shows output for the **show ip route** <*ipv4 address*> **longer-prefixes** command. Using the **longer-prefixes** parameter displays only the matching routes.

>**enable**
#show ip route 10.22.16.0 longer-prefixes
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
E1 - OSPF external type 1, E2 - OSPF external type 2
IA - OSPF inter area

Gateway of last resort is 10.22.18.254 to network 0.0.0.0

show ip route-cache express

Use the **show ip route-cache express** command to display the addresses currently being express cached in hardware. Variations of this command include:

show ip route-cache express
show ip route-cache express count

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

count	Optional. Displays only the total number of entries stored in the route cache.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following is sample output from the **show ip route-cache express** command:

```
>enable
#show ip route-cache express
DESTINATION     MASK              GATEWAY
-------------------------------------------------------------------------------
199.0.50.2      255.255.255.255   10.100.43.251
199.0.45.2      255.255.255.255   10.100.43.251
198.110.47.2    255.255.255.255   10.100.43.251
198.50.42.2     255.255.255.255   10.100.43.251
198.0.46.2      255.255.255.255   10.100.43.251
198.0.41.2      255.255.255.255   10.100.43.251
```

The following is sample output from the **show ip route-cache express count** command:

```
>enable
#show ip route-cache express count
Total number of express routes: 26
```

show ip route-cache express host-table

Use the **show ip route-cache express host-table** command to display the hardware host entries currently used to route packets to directly connected networks in Layer 3 switching. Variations of this command include:

show ip route-cache express host-table
show ip route-cache express host-table count

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

count	Optional. Specifies the output is limited to the number of entries stored in the Address Resolution Protocol (ARP) table.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following is sample output from the **show ip route-cache express host-table** command:

```
>enable
#show ip route-cache express host-table
DESTINATION     MAC ADDRESS        INTERFACE
-------------------------------------------------------------------------------
10.23.131.254   00:A0:C8:00:7E:D3  vlan 1
20.1.1.2        00:DE:AD:00:55:55  vlan 20
21.1.1.2        00:A0:C8:00:78:A8  vlan 21
22.1.1.2        00:A0:C8:24:7E:6A  vlan 22
```

show ip security

Use the **show ip security** command to display a list of threats with descriptions, corresponding IDs, default weights, and current weights. Variations of this command include:

show ip security any-vrf blocked-traffic timeline
show ip security any-vrf threats
show ip security any-vrf threats <*id*>
show ip security any-vrf threats <*id*> **realtime**
show ip security any-vrf threats realtime
show ip security any-vrf threats sort-by first-observed
show ip security any-vrf threats sort-by first-observed realtime
show ip security any-vrf threats sort-by hits
show ip security any-vrf threats sort-by hits realtime
show ip security any-vrf threats sort-by id
show ip security any-vrf threats sort-by id realtime
show ip security any-vrf threats sort-by last-observed
show ip security any-vrf threats sort-by last-observed realtime
show ip security any-vrf threats sort-by weight
show ip security any-vrf threats sort-by weight realtime
show ip security blocked-traffic timeline
show ip security threats
show ip security threats <*id*>
show ip security threats <*id*> **realtime**
show ip security threats realtime
show ip security threats sort-by first-observed
show ip security threats sort-by first-observed realtime
show ip security threats sort-by hits
show ip security threats sort-by hits realtime
show ip security threats sort-by id
show ip security threats sort-by id realtime
show ip security threats sort-by last-observed
show ip security threats sort-by last-observed realtime
show ip security threats sort-by weight
show ip security threats sort-by weight realtime
show ip security vrf <*name*> **blocked-traffic timeline**
show ip security vrf <*name*> **threats**
show ip security vrf <*name*> **threats** <*id*>
show ip security vrf <*name*> **threats** <*id*> **realtime**
show ip security vrf <*name*> **threats realtime**
show ip security vrf <*name*> **threats sort-by first-observed**
show ip security vrf <*name*> **threats sort-by first-observed realtime**
show ip security vrf <*name*> **threats sort-by hits**
show ip security vrf <*name*> **threats sort-by hits realtime**
show ip security vrf <*name*> **threats sort-by id**
show ip security vrf <*name*> **threats sort-by id realtime**

show ip security vrf <*name*> **threats sort-by last-observed**
show ip security vrf <*name*> **threats sort-by last-observed realtime**
show ip security vrf <*name*> **threats sort-by weight**
show ip security vrf <*name*> **threats sort-by weight realtime**

Syntax Description

any-vrf	Optional. Displays every available virtual routing and forwarding (VRF) on the device.
blocked-traffic timeline	Optional. Displays an hour-by-hour count of blocked threats and policy discards.
first-observed	Optional. Sorts the threat list by the first-observed threat.
hits	Optional. Sorts the threat list by number of hits.
id	Optional. Sorts the threat list by threat ID.
<*id*>	Optional. Displays a specific threat as identified by its threat ID.
last-observed	Optional. Sorts the threat list by the last-observed threat.
realtime	Optional. Lists the threats as they occur in real time rather than historical threat data.
sort-by <*option*>	Optional. Defines the criteria, by <*option*>, by which the threat list will be sorted. If **sort-by** is not indicated, the list will be sorted using the descending order of hits. All options will be sorted in descending order with the exception of threat IDs.
threats	Optional. Displays all observed security threats.
vrf <*name*>	Optional. Displays a specified named VRF.
weight	Optional. Sorts the threat list by threat weight.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Functional Notes

The **show ip security** command displays a list of threats with descriptions, corresponding IDs, default weights, and current weights. For threats that have been observed the number of hits, the time it was first observed, and the time it was most recently observed is displayed. Threat lists are sorted by hits unless another option is chosen by the user. All sorting options are displayed in descending order except for threat IDs. A single ID can be specified to display only that threat's information. The unnamed default VRF is implied unless a named VRF or **any-vrf** is specified. Historical data is displayed unless **realtime** is specified. Threats that have been blocked on the default unnamed VRF or **any-vrf** can also be viewed using **blocked-traffic timeline**.

Usage Examples

The following example displays a list of all threats on the default unnamed VRF sorted by threat weight:

>**enable**
#show ip security threats sort-by weight

The following example displays an hour-by-hour count of all blocked threats on the named VRF **MyVRF**:

>**enable**
#show ip security vrf MyVRF blocked-traffic timeline

show ip traffic

Use the **show ip traffic** command to display all Internet Protocol version 4 (IPv4) traffic statistics. Variations of this command include:

show ip traffic
show ip traffic netstat
show ip traffic realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

netstat	Optional. Displays active IPv4 Transmission Control Protocol (TCP) connections.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.5	Command was expanded to include the **netstat** keyword.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays all IPv4 traffic statistics:

>**enable**
#show ip traffic

IP statistics:
Routing discards: 0
Rcvd: 15873 total, 7617 delivered
0 header errors, 0 address errors
0 unknown protocol, 0 discards
0 checksum errors, 0 bad hop counts
Sent: 8281 generated, 4459 forwarded
0 no routes, 0 discards
Frags: 0 reassemble required, 0 reassembled, 0 couldn't reassemble
0 created, 0 fragmented, 0 couldn't fragment

UDP statistics:
Rcvd: 3822 total, 0 checksum errors, 0 no port
Sent: 3822 total

TCP statistics:
Retrans Timeout Algorithm: 0
Min retrans timeout (ms): 0
Max retrans timeout (ms): 0
Max TCP Connections: 0
0 active opens, 64 passive opens, 0 failed attempts
5 establish resets, 1 establish current
3795 segments received, 4459 segments sent, 26 segments retransmitted

show ip urlfilter

Use the **show ip urlfilter** command to display configured uniform resource locator (URL) filter and server information.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip urlfilter** command:

```
>enable
#show ip urlfilter

Configured for Websense URL filtering.
Filters
-------
Name: “filter1”
Ports: HTTP(80)
Interfaces that filter is applied to:
eth 0/2 inbound
Servers
-------
IP address: 10.100.23.116
Port: 15868
Timeout: 5
Excluded domains
----------------
Permit www.adtran.com
Other Settings
```

show ip urlfilter exclusive-domain

Use the **show ip urlfilter exclusive-domain** command to display all configured domains excluded (either always allowed or always blocked) from uniform resource locator (URL) filtering.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip urlfilter exclusive-domain** command:

```
>enable
#show ip urlfilter exclusive-domain

Excluded domains
----------
Permit www.adtran.com
```

show ip urlfilter statistics

Use the **show ip urlfilter statistics** command to display statistics for uniform resource locator (URL) filter requests and responses.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show ip urlfilter statistics** command:

```
>enable
#show ip urlfilter statistics

Current outstanding requests to filter server: 0
Current response packets buffered from web server: 2
Max outstanding requests to filter server: 3
Max response packets buffered from web server: 5
Total requests sent to filter server: 400
Total responses received from filter server: 400
Total requests allowed: 398
Total requests blocked: 2
```

show ip urlfilter top-websites

Use the **show ip urlfilter top-websites** command to display configured uniform resource locator (URL) filter and top websites reporting information. Variations of this command include the following:

show ip urlfilter top-websites
show ip urlfilter top-websites *<number>*
show ip urlfilter top-websites all
show ip urlfilter top-websites all *<number>*
show ip urlfilter top-websites daily
show ip urlfilter top-websites daily *<number>*
show ip urlfilter top-websites hourly
show ip urlfilter top-websites hourly *<number>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

all	Optional. Specifies that top websites statistics for all lists will be displayed.
daily	Optional. Specifies that top websites statistics in daily increments will be displayed.
hourly	Optional. Specifies that top websites statistics in hourly increments will be displayed.
<number>	Optional. Specifies how many websites to show on the report. Range is **5** to **20** websites.

Default Values

By default, a 15-minute incremented list of the 10 top websites requests is shown.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

The top websites statistic lists show the previous interval, not the current one. The output shows the period for which the statistics were collected, as well as the current time so it can be determined when the next update will occur.

Usage Examples

The following example displays the top 5 websites visited in the last 15 minutes:

#show ip urlfilter top-websites 5

Top Websites Visited
Period: Apr 26 08:55:00--Apr 26 09:10:00 Current Time: 09:15:34
Allow mode: enabled
The visits listed below are visits which were permitted. These statistics do not include websites explicitly filtered using exclusive domains.

Domain Name	Visits	Last Visitor	Visit Time
www.gmail.com	767	10.22.160.7	Apr 26 08:55:47
www.google.com	540	10.22.160.88	Apr 26 09:05:27
www.adtran.com	67	10.22.160.107	Apr 26 08:59:16
www.cisco.com	67	10.22.160.5	Apr 26 09:01:05
www.partypoker.com	15	10.22.160.45	Apr 26 09:04:43

show ipv6 access-list

Use the **show ipv6 access-list** command to display all configured Internet Protocol version 6 (IPv6) access control lists (ACLs) in the system. Variations of this command include:

show ipv6 access-list
show ipv6 access-list *<ipv6 acl name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv6 acl name>	Optional. Specifies a particular IPv6 ACL to display.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Functional Notes

The **show ipv6 access-list** command displays all configured IPv6 ACLs in the system. All entries in the IPv6 ACL are displayed, and a counter indicating the number of packets matching the entry is listed.

Usage Examples

The following is sample output from the **show ipv6 access-list** command, and displays information for the IPv6 ACL **Privatev6**:

```
>enable
#show ipv6 access-list Privatev6
Extended IPv6 access-list Privatev6
    deny tcp any eq telnet any (0 matches)
    deny tcp any any eq telnet (0 matches)
    permit ipv6 any host 2000:1::1 (0 matches)
    permit ipv6 host 2000:2::1 any (0 matches)
    permit icmpv6 any any (0 matches)
```

show ipv6 cache

Use the **show ipv6 cache** command to display the contents of the Internet Protocol version 6 (IPv6) route cache for each interface in a given virtual private network (VPN) routing and forwarding (VRF) instance. The route cache contains information about which egress interface, IPv6 gateway address, and MAC address to use when forwarding packets to a given destination. Variations of this command include:

show ipv6 cache
show ipv6 cache vrf <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

vrf <*name*>	Optional. Specifies a nondefault VRF instance for which to display route cache information. If no VRF instance is specified, route cache information for the default VRF instance is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example displays route cache statistics for the default VRF instance:

>**enable**
#show ipv6 cache
INGRESS: giga-eth 0/1.1001
DEST: 2001:1111:2222:3333:4444:5555:6666:7777, EGRESS: giga-eth 0/1.1002,
COUNT: 1000000000, GATEWAY: 2001:1111:2222:3333:4444:5555:6666:0001,
MAC: 00:a0:c8:00:00:01, ID: 0x01000000
DEST: 2001::1, EGRESS: ppp 1,
COUNT: 100, GATEWAY: 2001::1:0001,
MAC: n/a, ID: 0x01010000
DEST: 2001::2, EGRESS: ppp 1,
COUNT: 100, GATEWAY: 2001::1:0001,
MAC: n/a, ID: 0x01020000

show ipv6 crypto ipsec sa

Use the **show ipv6 crypto ipsec sa** command to display information about the Internet Protocol version 6 (IPv6) cryptographic subsystem and IP security (IPsec) security association (SA) configuration on the AOS device. Variations of this command include:

show ipv6 crypto any-vrf ipsec sa
show ipv6 crypto any-vrf ipsec sa map *<name>*
show ipv6 crypto any-vrf ipsec sa map *<name>* **inbound**
show ipv6 crypto any-vrf ipsec sa map *<name>* **outbound**
show ipv6 crypto any-vrf ipsec sa address *<ipv6 address>*
show ipv6 crypto any-vrf ipsec sa address *<ipv6 address>* **inbound**
show ipv6 crypto any-vrf ipsec sa address *<ipv6 address>* **outbound**
show ipv6 crypto any-vrf ipsec sa brief
show ipv6 crypto any-vrf ipsec sa brief inbound
show ipv6 crypto any-vrf ipsec sa brief outbound
show ipv6 crypto any-vrf ipsec sa inbound
show ipv6 crypto any-vrf ipsec sa internal-id *<id>*
show ipv6 crypto any-vrf ipsec sa internal-id *<id>* **inbound**
show ipv6 crypto any-vrf ipsec sa internal-id *<id>* **outbound**
show ipv6 crypto any-vrf ipsec sa ospfv3
show ipv6 crypto any-vrf ipsec sa ospfv3 inbound
show ipv6 crypto any-vrf ipsec sa ospfv3 outbound
show ipv6 crypto any-vrf ipsec sa outbound
show ipv6 crypto ipsec sa
show ipv6 crypto ipsec sa map *<name>*
show ipv6 crypto ipsec sa map *<name>* **inbound**
show ipv6 crypto ipsec sa map *<name>* **outbound**
show ipv6 crypto ipsec sa address *<ipv6 address>*
show ipv6 crypto ipsec sa address *<ipv6 address>* **inbound**
show ipv6 crypto ipsec sa address *<ipv6 address>* **outbound**
show ipv6 crypto ipsec sa brief
show ipv6 crypto ipsec sa brief inbound
show ipv6 crypto ipsec sa brief outbound
show ipv6 crypto ipsec sa inbound
show ipv6 crypto ipsec sa internal-id *<id>*
show ipv6 crypto ipsec sa internal-id *<id>* **inbound**
show ipv6 crypto ipsec sa internal-id *<id>* **outbound**
show ipv6 crypto ipsec sa ospfv3
show ipv6 crypto ipsec sa ospfv3 inbound
show ipv6 crypto ipsec sa ospfv3 outbound
show ipv6 crypto ipsec sa outbound
show ipv6 crypto vrf *<name>* **ipsec sa**
show ipv6 crypto vrf *<name>* **ipsec sa map** *<name>*
show ipv6 crypto vrf *<name>* **ipsec sa map** *<name>* **inbound**
show ipv6 crypto vrf *<name>* **ipsec sa map** *<name>* **outbound**

show ipv6 crypto vrf <*name*> **ipsec sa address** <*ipv6 address*>
show ipv6 crypto vrf <*name*> **ipsec sa address** <*ipv6 address*> **inbound**
show ipv6 crypto vrf <*name*> **ipsec sa address** <*ipv6 address*> **outbound**
show ipv6 crypto vrf <*name*> **ipsec sa brief**
show ipv6 crypto vrf <*name*> **ipsec sa brief inbound**
show ipv6 crypto vrf <*name*> **ipsec sa brief outbound**
show ipv6 crypto vrf <*name*> **ipsec sa inbound**
show ipv6 crypto vrf <*name*> **ipsec sa internal-id** <*id*>
show ipv6 crypto vrf <*name*> **ipsec sa internal-id** <*id*> **inbound**
show ipv6 crypto vrf <*name*> **ipsec sa internal-id** <*id*> **outbound**
show ipv6 crypto vrf <*name*> **ipsec sa ospfv3**
show ipv6 crypto vrf <*name*> **ipsec sa ospfv3 inbound**
show ipv6 crypto vrf <*name*> **ipsec sa ospfv3 outbound**
show ipv6 crypto vrf <*name*> **ipsec sa outbound**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

any-vrf	Optional. Displays IPsec information for all virtual routing and forwarding (VRF) instances.
vrf <*name*>	Optional. Displays IPsec information for a nondefault VRF instance.
map <*name*>	Optional. Displays IPsec security associations (SAs) created by the specified crypto map.
address <*ipv6 address*>	Optional. Displays all IPsec SAs associated with the designated peer IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (**X:X:X:X::X**). For example, **2001:DB8:1::1**..
brief	Optional. Displays a brief listing of IPsec SAs.
inbound	Optional. Displays inbound IPsec SAs only.
outbound	Optional. Displays outbound IPsec SAs only.
internal-id <*id*>	Optional. Displays the IPsec SA with a specified internal ID. Valid range is **0** to **4294967295**.
ospfv3	Optional. Displays IPsec SAs created for Open Shortest Path First version 3 (OSPFv3) authentication and confidentiality.

Default Values

No default values are necessary for this command.

Command History

Release R10.5	Command was introduced.
Release R10.7	Command was expanded to include the **map** <*name*> parameter.

Usage Examples

The following is sample output from the **show ipv6 crypto ipsec sa ospfv3** command:

```
>enable
#show ipv6 crypto ipsec sa ospfv3
Peer IP Address: ::
  Direction: Inbound
  Encapsulation: ESP transport
  SPI: 0x00000BB8 (3000)
  RX Bytes: 512

Peer IP Address: ::
  Direction: Outbound
  Encapsulation: ESP transport
  SPI: 0x00000BB8 (3000)
  TX Bytes: 512
```

show ipv6 dhcp

Use the **show ipv6 dhcp** command to display the Dynamic Host Control Protocol version 6 (DHCPv6) Unique Identifier (DUID) of the AOS device. The DUID is used to identify the entire DHCPv6 client device independent of its interfaces and hardware.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.

Usage Examples

The following example displays output from the **show ipv6 dhcp** command:

```
>enable
#show ipv6 dhcp
The DHCPv6 unique identifier (DUID) of this device is: 0003000100A0C800611F
```

show ipv6 dhcp binding

Use the **show ipv6 dhcp binding** command to display details about stateful information assigned and bound to individual Dynamic Host Control Protocol version 6 (DHCPv6) clients as maintained by the DHCPv6 server. Variations of this command include:

show ipv6 dhcp binding
show ipv6 dhcp binding *<ipv6 address>*
show ipv6 dhcp binding *<ipv6 address>* **summary**
show ipv6 dhcp binding summary
show ipv6 dhcp binding vrf *<name>*
show ipv6 dhcp binding vrf *<name> <ipv6 address>*
show ipv6 dhcp binding vrf *<name> <ipv6 address>* **summary**
show ipv6 dhcp binding vrf *<name>* **summary**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv6 address>	Optional. Limits the output to a single DHCPv6 client IPv6 address. IPv6 addresses should be expressed in colon hexadecimal format (for example, **2001:DB8:1::1**.
summary	Optional. Summarizes the command output.
vrf *<name>*	Optional. Limits output to a nondefault virtual routing and forwarding (VRF) instance. If no VRF is specified, bindings on all VRF instances are displayed.

Default Values

No default values necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example displays all DHCPv6 binding information:

```
>enable
#show ipv6 dhcp binding
Client: FE80::20F:35FF:FE2E:2AB9 eth 0/2
        DUID: 00030001000F352E2AB9
        Hostname: <unassigned>
        IA PD: IA ID 0x001A0001, T1 302400, T2 483840
                Prefix: 55:44:33:22::/64
                        preferred lifetime 604800, valid lifetime 2592000
                        expires as 2011/11/23 AD at 13:05:40 CST (56 seconds)
                Prefix: 44:33:22:11::/64
                        preferred lifetime 604800, valid lifetime 2592000
                        expires at 2011.11.23 AD at 13:05:40 CST (56 seconds)
        IA NA: IA ID 0x00000001, T1 43200, T2 69120
                Address: 2000:3::790DC94:6C36:9562 from pool MYPOOL

                Address: 2000:3::4469:960:7C0E:EE6F
                        preferred lifetime 86400, valid lifetime 172800
                        expires at 2011.11.23 AD at 13:05:40 CST (56 seconds)
```

show ipv6 dhcp conflict

Use the **show ipv6 dhcp conflict** command to display detailed information about any addresses deemed as conflicting by a Dynamic Host Control Protocol version 6 (DHCPv6) client or by the DHCPv6 server when the client is pinged. Variations of this command include:

show ipv6 dhcp conflict
show ipv6 dhcp conflict *<ipv6 address>*
show ipv6 dhcp conflict vrf *<name>*
show ipv6 dhcp conflict vrf *<name> <ipv6 address>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv6 address>	Optional. Limits the output to conflicting addresses for the specified client address. IPv6 addresses should be expressed in colon hexadecimal format (for example, **2001:DB8:1::1**).
vrf *<name>*	Optional. Limits the output to a nondefault virtual routing and forwarding (VRF) instance. If no VRF is specified, conflicting addresses on all VRF instances are displayed.

Default Values

No default values necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example displays all DHCPv6 conflicting IPv6 addresses:

```
>enable
#show ipv6 dhcp conflict
Address/Prefix                          Reason      TTL (seconds)
1111:2222:333:4444:5555:66:7777/128     PING        44
1111:2222:333:4444:5555:66:7777/128     DECL        56
```

show ipv6 dhcp interface

Use the **show ipv6 dhcp interface** command to display the Dynamic Host Control Protocol version 6 (DHCPv6) mode and settings for interfaces configured for DHCPv6. Variations of this command include:

show ipv6 dhcp interface *<interface>*
show ipv6 dhcp interface *<interface>* **summary**
show ipv6 dhcp interface efm-group *<group id>*
show ipv6 dhcp interface mef-ethernet <*slot/port***>**
show ipv6 dhcp interface system-control-evc
show ipv6 dhcp interface system-control-evc summary
show ipv6 dhcp interface system-management-evc
show ipv6 dhcp interface system-management-evc summary

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Specifies the interface for which to display DHCPv6 settings. Specify interfaces in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id>*. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **show ipv6 dhcp interface ?** for a list of available interfaces.
efm-group *<group id>*	Specifies an Ethernet in the first mile (EFM) group ID. Range is **1** to **1024**.
mef-ethernet *<slot/port>*	Optional. Displays RapidRoute entries for the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Specifies DHCPv6 settings for the system control Ethernet virtual connection (EVC) are displayed.
system-management-evc	Specifies DHCPv6 settings for the system management EVC are displayed.
summary	Optional. Summarizes the command output.

Default Values

No default values necessary for this command.

Command History

Release R10.1.0	Command was introduced.
Release R10.5.0	Command was expanded to include the loopback interface.

Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group interface.

Usage Examples

The following example displays the DHCPv6 mode and settings for the **eth 0/1** interface:

```
>enable
#show ipv6 dhcp interface eth 0/1
!
interface Ethernet 0/1
        ipv6
        ipv6 nd ra suppress
        ipv6 address dhcp
        ipv6 dhcp client pd prefix1
```

show ipv6 dhcp pool

Use the **show ipv6 dhcp pool** command to display the information about each configured Dynamic Host Control Protocol version 6 (DHCPv6) pool and the general statistics of the current pool assignments. Variations of this command include:

show ipv6 dhcp pool
show ipv6 dhcp pool *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Limits the command output to only the statistics for the specified DHCPv6 server pool.

Default Values

No default values necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example displays the configuration of all DHCPv6 server pools:

```
>enable
#show ipv6 dhcp pool
Pool POOL
        Link Addresses:
                22::/64
                22::/96
        Client Identifiers:
                112233445566 2
                112233445566
        Address Prefixes:
                22::/64 lifetime 60 30
        Host client-identifier AABBCCDD
                Hostname: server1
```

```
        Host client-identifier AABBCCDD1122
                Hostname: AACCDDBB
                Address: 22::99
Client: FE80::204:E2FF:FE3E:C786 eth 0/2
        DUID: 00000000000000000000000000DF
        Hostname: winxp
        IA NA: IA ID 0x00000001, T1 15, T2 24
                Address: 22::19C1:AC2:8277:CB39 from pool POOL
                        preferred lifetime 30, valid lifetime 60
                        expires at 2011.11.23 AD at 13:33: CST (47 seconds)
Client: FE80::B098:1B0E:27CA:A8AB eth 0/2
        DUID: 000100010D86F190019B9324A8E
        Hostname: <unassigned>
        IA NA: IA ID 0x0E000475, T1 15, T2 24
                Address: 22::4CC2:9F4E:3C68:1E55 from pool POOL
                        preferred lifetime 30, valid lifetime 60
                        expires at 2011.11.23 AD at 13:33:04 CST (46 seconds)
```

show ipv6 ffe

Use the **show ipv6 ffe** command to display current Internet Protocol version 6 (IPv6) RapidRoute fast forwarding engine (FFE) entries. Variations of this command include:

show ipv6 ffe

show ipv6 ffe destination <*ipv6 address*>
show ipv6 ffe destination <*ipv6 address*> **egress** <*interface*>
show ipv6 ffe destination <*ipv6 address*> **egress system-control-evc**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

destination <*ipv6 address*>	Optional. Filters output by a destination IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (for example, **2001:DB8:1::1**).
destination-port <*port*>	Optional. Filters output by destination Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) port. Ports range from **0** to **65535**.
details	Optional. Displays detailed information. Refer to the Functional Notes for more information about using the details keyword.
egress <*interface*>	Optional. Displays RapidRoute entries for an egress interface. Specify an interface in the format <*interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | group id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface use **efm-group 1**. Type **show ipv6 ffe egress ?** for a complete list of valid interfaces.
egress ipsec <*rapidroute interface ID*>	Optional. Displays RapidRoute entries that come from an Internet Protocol security (IPsec) security association (SA) on a specified RapidRoute interface. RapidRoute interface identifiers range from **1** to **16777215**.
icmp-type <*type*>	Optional. Displays RapidRoute entries using a specific Internet Control Message Protocol (ICMP) type. There are three types of ICMP to choose from: **echo** Displays ICMP echo RapidRoute entries. **reply** Displays ICMP reply RapidRoute entries. **0** to **255** Displays other ICMP types.

ingress <*interface*>	Optional. Displays RapidRoute entries for an ingress interface. Specify an interface in the format <*interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | group id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface use **efm-group 1**. Type **show ipv6 ffe ingress ?** for a complete list of valid interfaces.
ingress ipsec <*rapidroute interface ID*>	Optional. Displays RapidRoute entries that go to an IPsec SA on a specified RapidRoute interface. RapidRoute interface identifiers range from **1** to **16777215**.
peak	Optional. Displays the current and peak count of RapidRoute sessions. Information is displayed for each eligible interface and the global values.
history	Optional. Displays a graphical presentation of the peak global RapidRoute cont per second for the last 60 seconds. Additionally displays the peak and average global RapidRoute count per minute for the last 60 minutes, as well as the peak and average global RapidRoute count per hour for the last 72 hours.
protocol <*protocol*>	Optional. Displays RapidRoute entries that use a specified protocol. Protocols can be specified by selecting one of the following: **ah** Displays Authentication Header (AH) Protocol RapidRoute entries. **esp** Displays Encapsulating Security Payload (ESP) Protocol RapidRoute entries. **fragment** Displays fragmented (FRAG) RapidRoute entries. **gre** Displays Generic Route Encapsulation (GRE) Protocol RapidRoute entries. **icmp6** Displays ICMPv6 RapidRoute entries. **tcp** Displays TCP RapidRoute entries. **udp** Displays UDP RapidRoute entries. **0** to **255** Displays other protocol types.
source <*ipv6 address*>	Optional. Displays RapidRoute entries for a specified source IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (for example, **2001:DB8:1::1**).
source-port <*port*>	Optional. Displays RapidRoute entries for a specified TCP or UDP source port. Ports range from **0** to **65535**.
system-control-evc	Optional. Displays RapidRoute entries for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays RapidRoute entries for the system management EVC.

type <*type*>	Optional. Displays RapidRoute entries of a specific type. Specified types include one of the following: **ineligible** Displays only ineligible RapidRoute entries. **rejected** Displays only rejected RapidRoute entries. **valid** Displays only valid RapidRoute entries.
wildcard	Optional. Displays wildcards for each IP interface.
interface <*interface*>	Optional. Limits the wildcard output to the specified interface. Interfaces are specified in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *group id]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an EFM group interface, use **efm-group 1**. Type **show ipv6 ffe wildcard interface ?** to display a complete list of valid interfaces.

Default Values

No default values are necessary for this command.

Command History

Release R10.4.0	Command was introduced.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.
Release R11.3.0	Command was expanded to include the Ethernet in the first mile (EFM) group interface.
Release R11.4.0	Command was expanded to include the **fragment** option in the **protocol** parameter.
Release R11.10.0	Command was expanded to include the **peak** and **wildcard** parameters.
Release R13.7.0	Command was expanded to include the Gigabit Ethernet and virtual local area network (VLAN) interfaces.

Functional Notes

The **show ipv6 ffe** command can be further filtered by adding any combination of the following parameters:

destination <*ipv6 address*>
destination-port <*port*>
details
egress <*interface*>
egress ipsec <*rapidroute interface ID*>
icmp-type <*type*>
ingress <*interface*>

ingress ipsec <*rapidroute interface ID*>
protocol <*protocol*>
source <*ipv6 address*>
source-port <*port*>
type <*type*>

For example, the **destination** <*ipv6 address*> and **source** <*ipv6 address*> parameters can be used in conjunction with one another. In this case, the command would look like this:

#show ipv6 ffe destination 2001:DB8:1::1 source 2001:DB8:1::2

These parameters can be combined in any order, and as many times as is necessary to get the desired output.

*The **detail** keyword must be the last keyword in the command. For example, **show ipv6 ffe destination** <ipv6 address> **egress** <interface> **source-port** <port> **details** is acceptable, but **show ipv6 ffe destination** <ipv6 address> **details egress** <interface> is not.*

Data for the **peak history** parameters is presented as a percentage of the value configured with the command *ipv6 ffe max-entries <value> on page 1520*. Changing the **ipv6 ffe max-entries** value clears the related FFE peak information.

Usage Examples

The following is sample output from the **show ipv6 ffe** command:

```
>enable
#show ipv6 ffe
Timeout     TCP     UDP     ICMP    AH      ESP     GRE     Other

```

show ipv6 ffe summary

Use the **show ipv6 ffe summary** command to display a summary of all the current Internet Protocol version 6 (IPv6) RapidRoute fast forwarding engine (FFE) entries.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following is sample output from the **show ipv6 ffe summary** command:

```
>enable
#show ipv6 ffe summary
Ingress          MaxEntries   Entries   Hits   Misses     Drops
---------        ----------   -------   ----   --------   -------
eth 0/1          4096         1         1000   200        11
eth 0/2.1        4096         1         1123   211        0
eth 0/2.2        4096         1         1467   301        0
                 ----------   -------   ----   --------   -------
          Global 16384        3         3590   712        11
```

show ipv6 interfaces

Use the **show ipv6 interfaces** command to display the status information for all Internet Protocol version 6 (IPv6) interfaces (or a specific IPv6 interface). This information includes IPv6 addressing, configured parameters, and any IPv6 capabilities in use. Variations of this command include:

show ipv6 interfaces
show ipv6 interfaces brief
show ipv6 interfaces <*ipv6 interface*>
show ipv6 interfaces <*ipv6 interface*> **prefix**
show ipv6 interfaces mef-ethernet <*slot/port*>
show ipv6 interfaces mef-ethernet <*slot/port*> **prefix**
show ipv6 interfaces system-control-evc
show ipv6 interfaces system-control-evc prefix
show ipv6 interfaces system-management-evc
show ipv6 interfaces system-management-evc prefix

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

brief	Optional. Displays an abbreviated version of interface statistics for all IPv6 interfaces.
<*ipv6 interface*>	Optional. Displays status information for a specific IPv6 interface. Specify an IPv6 interface in the format <*interface*> <*slot/port* | *interface id*>. For example, Point-to-Point Protocol (PPP) interface, enter **ppp 1**. If no interface is specified, status information for all IPv6 interfaces is displayed.
mef-ethernet <*slot/port*>	Optional. Displays status information for the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Displays status information for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays status information for the system management EVC.
prefix	Optional. Displays the list of prefixes for the specified IPv6 interface.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the tunnel interface.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following is sample output of the **show ipv6 interfaces** command, and displays information in brief format for the ethernet 0/1 interface:

```
>enable
#show ipv6 interfaces brief ethernet 0/1
eth 0/1 [UP/UP]
    FE80::2AO:C8FF:FE61:3082
    2003::2AO:C8FF:FE61:3082
```

show ipv6 mld groups link-local

Use the **show ipv6 mld groups link-local** command to display the known Multicast Listener Discovery (MLD) groups used by Internet Protocol version 6 (IPv6) features on the AOS router. Variations of this command include:

show ipv6 mld groups link-local
show ipv6 mld groups link-local <*interface*>
show ipv6 mld groups link-local vrf <*name*>
show ipv6 mld groups link-local vrf <*name*> <*interface*>

Syntax Description

<*interface*>	Optional. Specifies that only MLD groups registered on the specified interface are displayed. Specify an IPv6 interface in the format <*interface*> <*slot/port* | *interface id*>, for example, to use a Point-to-Point Protocol (PPP) interface, enter **ppp 1**.
vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance for which to display the MLD groups. If a VRF is not specified, MLD groups for the default (unnamed) VRF are displayed.

Default Values

No default values are necessary for this command.

Command History

Release R11.4.0	Command was introduced.

Usage Examples

The following example displays the MLD groups used on the Gigabit Ethernet subinterface **0/2.1**:

```
>enable
#show ipv6 mld groups link-local giga-eth 0/2.1
    MLD Connected Group Membership
    Group Address                 Interface          Uptime      Expires
    FF02::1                       giga-eth 0/2.1     13h32m32s   Never
    FF02::2                       giga-eth 0/2.1     13h32m32s   Never
    FF02::1:FF00:1234             giga-eth 0/2.1     13h32m32s   Never
    FF02::1:FF01:2CC              giga-eth 0/2.1     13h32m32s   Never
```

show ipv6 mld traffic

Use the **show ipv6 mld traffic** command to display the Internet Protocol version 6 (IPv6) Multicast Listener Discovery (MLD) traffic counters. Variations of this command include:

show ipv6 mld traffic
show ipv6 mld traffic vrf <*name*>

Syntax Description

vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance for which to clear the MLD traffic counters. If a VRF is not specified, MLD counters for the default (unnamed) VRF are displayed.

Default Values

No default values are necessary for this command.

Command History

Release R11.4.0	Command was introduced.

Usage Examples

The following example displays all MLD traffic counters:

```
>enable
#show ipv6 mld traffic
    MLD Traffic Counters
    Elapsed time since counters cleared: Never cleared

                                Sent            Received
    Valid MLD Packets           3263            1628
    Queries                     0               1628
    Reports                     3263            0
    Leaves                      0               0

    Errors:
    Malformed Packets                           0
    Non link-local source                       0
    Hop limit not equal to 1                    0
```

show ipv6 named-prefix

Use the **show ipv6 named-prefix** command to display information about the Internet Protocol version 6 (IPv6) named prefixes configured on the router. Information displayed includes which prefixes are assigned, how they are configured and delegated, and which interfaces are configured to be addressed using the named prefix.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.9.0	Command was introduced.

Usage Examples

The following example displays IPv6 named prefix information:

```
>enable
#show ipv6 named-prefix
!
IPv6 Prefix manualprefix, acquired via Manual configuration
    2001::/64 Valid lifetime infinite, preferred lifetime infinite
        Ethernet 0/2 (Address command)

IPv6 Prefix delegatedprefix, acquired via DHCP PD
    2001:1::/64 Valid lifetime 3202, preferred lifetime 1402
        Ethernet 0/3 (Address command)

IPv6 Prefix delegatedprefix, acquired via DHCP PD (DEPRECATED BY SERVER)
    2001:1::/64 Valid lifetime 132, preferred lifetime 0
        Ethernet 0/3 (Address command)
```

show ipv6 neighbors

Use the **show ipv6 neighbors** command to display the Internet Protocol version 6 (IPv6) Neighbor Discovery (ND) cache. This cache contains information about IPv6 nodes that have been added to the cache, including the link-layer IPv6 address and the reachability state of that neighbor. Neighbor cache entries are created when there is a packet to send to an on-link destination, or when a neighbor solicitation (NS), router solicitation (RS), or router advertisement (RA) message is received. Variations of this command include:

show ipv6 neighbors
show ipv6 neighbors <*interface*>
show ipv6 neighbors <*interface*> <*ipv6 address*>
show ipv6 neighbors <*interface*> **statistics**
show ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]**
show ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]** <*ipv6 address*>
show ipv6 neighbors [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc] statistics**
show ipv6 neighbors statistics
show ipv6 neighbors vrf <*name*>
show ipv6 neighbors vrf <*name*> <*ipv6 address*>
show ipv6 neighbors vrf <*name*> **statistics**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*interface*>	Optional. Displays the neighbor cache information for a specified interface. IPv6 interfaces are specified in the <*interface*> <*slot/port* | *interface id*> format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. If no interface is specified, information for all interfaces is displayed.
mef-ethernet <*slot/port*>	Optional. Displays the neighbor cache information for the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Displays the neighbor cache information for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays the neighbor cache information for the system management EVC.

<ipv6 address>	Optional. Displays the neighbor cache information for a specified IPv6 address. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**.
statistics	Optional. Displays neighbor cache statistics and protocol interaction information for the neighbor cache.
vrf *<name>*	Optional. Displays the neighbor cache information for a specified virtual routing and forwarding (VRF) instance. If no VRF is specified, information for the unnamed default VRF is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output of the **show ipv6 neighbors** command, which displays all information for the ND cache:

```
>enable
#show ipv6 neighbors
IPv6 Address                    Age  Link-layer Addr  State   Interface
2002::1                          0   000f.352.3.2aba  REACH   eth 0/0
2003::ED9A:D1A3:BB9B:BDFF        0   0013.ce61.65b9   REACH   eth 0/1
20FF:11::ED9A:D1A3:BB9B:BDFF    18   0013.ce.61.65b9  STALE   eth 0/1
FE80::213:CEFF:FE61:65B9        10   0013.ce.61.65b9  DELAY   eth 0/1
FE80::20F:35FF:FE2E:2ABA         1   000f.352e.2aba   DELAY   eth 0/1
```

show ipv6 policy-sessions

Use the **show ipv6 policy-sessions** command to display a list of current Internet Protocol version 6 (IPv6) access control policy (ACP) associations in the IPv6 firewall. Current associations are active or recently active sessions allowed through the firewall. Refer to *ipv6 policy-class <ipv6 acp name> on page 1549* for information on configuring IPv6 ACPs. Variations of this command include:

show ipv6 policy-sessions
show ipv6 policy-sessions *<ipv6 acp name>*
show ipv6 policy-sessions any-vrf
show ipv6 policy-sessions vrf *<name>*
show ipv6 policy-sessions pending
show ipv6 policy-sessions pending *<ipv6 acp name>*
show ipv6 policy-sessions pending any-vrf
show ipv6 policy-sessions pending vrf *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv6 acp name>	Optional. Displays IPv6 policy class associations for the specified IPv6 ACP.
pending	Optional. Displays any currently pending policy sessions.
any-vrf	Optional. Displays information for all virtual routing and forwardings (VRFs) policy sessions.
vrf *<name>*	Optional. Specifies the particular firewall instance for which active policy sessions will be displayed. If no VRF is specified, policy sessions are displayed for the default VRF only.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the **pending** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show ipv6 policy-sessions** command and displays information for IPv6 ACPs:

```
>enable
#show ipv6 policy-sessions
NOTE: The “Layer 4” info below for TCP and UDP is source port and dest port. For ICMPv6, it is ID and
    type/code. For all other protocols, it is unused.

Src VRF (if not default), Src policy-class:
Protocol (TTL) -> Dest VRF, Dest policy-class
    Src IPv6 Address                Layer 4
    Dest IPv6 Address               Layer 4
    ------------------------        ----------

Ipv6 policy-class PRIVATEV6:
icmpv6 (59) -> self
    2001:DB8:1:1::2                 0
    2001:DB8:1:1::1                 128/0
```

show ipv6 policy-stats

Use the **show ipv6 policy-stats** command to display a list of current Internet Protocol version 6 (IPv6) access control policy (ACP) statistics. Refer to *ipv6 policy-class <ipv6 acp name> on page 1549* for information on configuring IPv6 ACPs. Variations of this command include:

show ipv6 policy-stats
show ipv6 policy-stats *<ipv6 acp name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<ipv6 acp name>	Optional. Displays policy class statistics for a specific IPv6 ACP.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Usage Examples

The following example displays a list of current IPv6 ACP statistics:

```
>enable
#show ipv6 policy-stats
```

show ipv6 prefix-list

Use the **show ipv6 prefix-list** command to display Internet Protocol version 6 (IPv6) Border Gateway Protocol (BGP) prefix list information. Variations of this command include:

show ipv6 prefix-list *<name>*
show ipv6 prefix-list detail *<name>*
show ipv6 prefix-list summary *<name>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<name>	Shows information for a specific prefix list.
detail	Optional. Shows a listing of the specified prefix list rules and their hit counts.
summary	Optional. Shows summarized information about the specified prefix list.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Functional Notes

If the **show ipv6 prefix-list** command is issued with no arguments, a listing of the prefix-list rules, but no hit count statistics, is displayed.

Usage Examples

The following example displays information about the prefix list **TEST1**.

```
>enable
#show ipv6 prefix-list TEST1
ipv6 prefix-list TEST1: 4 entries
  seq 5 permit 0.0.0.0/0 ge 8 le 8
  seq 10 deny 0.0.0.0/0 ge 9 le 9
  seq 15 permit 0.0.0.0/0 ge 10 le 10
  seq 20 deny 0.0.0.0/0 ge 11
```

show ipv6 route

Use the **show ipv6 route** command to display the contents of the Internet Protocol version 6 (IPv6) route table. This table contains information about IPv6 networks and how to reach them. Variations of this command include:

show ipv6 route
show ipv6 route *<ipv6 address>*
show ipv6 route *<ipv6 address>* **longer-prefixes**
show ipv6 route *<ipv6 prefix/prefix-length>*
show ipv6 route *<ipv6 prefix/prefix-length>* **longer-prefixes**
show ipv6 route bgp
show ipv6 route bgp verbose
show ipv6 route connected
show ipv6 route ospf
show ipv6 route ospf verbose
show ipv6 route static
show ipv6 route static verbose
show ipv6 route summary
show ipv6 route summary realtime
show ipv6 route vrf *<name>*
show ipv6 route vrf *<name> <ipv6 address>*
show ipv6 route vrf *<name> <ipv6 address>* **longer-prefixes**
show ipv6 route vrf *<name> <ipv6 prefix/prefix-length>*
show ipv6 route vrf *<name> <ipv6 prefix/prefix-length>* **longer-prefixes**
show ipv6 route vrf *<name>* **bgp**
show ipv6 route vrf *<name>* **connected**
show ipv6 route vrf *<name>*
show ipv6 route vrf *<name>* **verbose**
show ipv6 route vrf *<name>* **static**
show ipv6 route vrf *<name>* **summary**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<ipv6 address>	Optional. Specifies a valid IPv6 address. IPv6 addresses should be expressed in colon hexadecimal notation (**X:X:X:X::X**). For example, **2001:DB8:1::1**.
<ipv6 prefix/prefix-length>	Optional. Specifies the IPv6 prefix. IPv6 prefixes should be expressed in colon hexadecimal format (**X:X::X/<Z>**). For example, **2001:DB8:3F::/64**. The prefix length (**<Z>**) is an integer with a value between **0** and **128**.
bgp	Optional. Displays IPv6 route information for Border Gateway Protocol (BGP) configurations.
connected	Optional. Displays only the IPv6 routes for directly connected networks.
longer-prefixes	Optional. Displays only the IPv6 routes matching the specified network.
ospf	Optional. Displays only the Open Shortest Path First version 3 (OSPFv3) IPv6 routes.
static	Optional. Displays only the IPv6 routes that were statically entered.
summary	Optional. Displays a summary of all IPv6 route information.
summary realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
verbose	Optional. Enables detailed messaging.
vrf *<name>*	Optional. Displays only the IPv6 routes for the specified virtual routing and forwarding (VRF).

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the **bgp** parameter.
Release R10.5.0	Command was expanded to include the **ospf** parameter.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example shows how to display IPv6 routes table information for the IPv6 address prefix **2001::/64**:

```
>enable
#show ipv6 route 2001::/64
Routing entry for 2001::/64
        Known via “static”
        Distance 1, metric 0
        Routing Next Hop(s):
            2002::1, via eth 0/1
             Route metric is 0
```

The following example shows output for the **show ipv6 route summary** command.

```
>enable
#show ipv6 route summary
Route Source            FIB         Local-RIB
    Connected            3           3
    Other               18          18

    Total               21          21
```

show ipv6 route named-prefix

Use the **show ipv6 route named-prefix** command to display all Internet Protocol version 6 (IPv6) routes generated by a named prefix.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.9.0	Command was introduced.

Usage Examples

The following example displays all IPv6 routes generated by a named prefix:

```
>enable
#show ipv6 route named-prefix
Codes: C-connected, S-static, O-OSPF, B-BGP
       E1-OSPF external type 1, E2-OSPF external type 2
       I-OSPF inter area, NP-named prefix, D-DHCPv6 PD

Gateway of last resort is not set

C   1::/64
    is directly connected, eth 0/1

NP      1::1:0:0:0/80
(1/0/0) via 1::1, Loopback
```

show ipv6 routers

Use the **show ipv6 routers** command to display information learned from router advertisement (RA) messages received from locally reachable routers when using Internet Protocol version 6 (IPv6). Variations of this command include:

show ipv6 routers
show ipv6 routers conflict
show ipv6 routers <*interface*>
show ipv6 routers <*interface*> **conflict**
show ipv6 routers [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]**
show ipv6 routers [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc] conflict**
show ipv6 routers vrf <*name*>
show ipv6 routers vrf <*name*> **conflict**

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

conflict	Optional. Specifies that only information about routers whose advertisements are in conflict with current configurations are displayed.
<*interface*>	Optional. Displays information for the specified interface. Specify interfaces in the <*interface*> <*slot/port* | *interface id*> format. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**.
mef-ethernet <*slot/port*>	Optional. Displays information for the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Displays information for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays information for the system management EVC.
vrf <*name*>	Optional. Displays only the IPv6 routes for the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, information for the default VRF is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.1.0	Command was expanded to include the tunnel interface.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

In the following example, RA statistics for all interfaces on the default VRF are displayed:

```
>enable
#show ipv6 routers
Router FE80::20F:35FF:FE2E:2ABA on Ethernet 0/0, last update 1 min, CONFLICT
    Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0, MTU=1500
    Preference=Medium
    Reachable time 0 (unspecified) ms, Retransmit time 0 (unspecified) ms
    Prefix 2002::/64 on-link autoconfig
        Valid lifetime 8002, preferred lifetime 2008
```

show ipv6 traffic

Use the **show ipv6 traffic** command to display system-wide Internet Protocol version 6 (IPv6) and Internet Control Message Protocol version 6 (ICMPv6) traffic statistics. Variations of this command include:

show ipv6 traffic
show ipv6 traffic realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays all IPv6 traffic statistics:

>**enable**
#show ipv6 traffic
IPv6 statistics:
Rcvd: 0 total, 9 local destination
0 header errors, 0 address errors
0 unknown protocol, 0 discards
0 truncated, 0 bad hop counts
Sent: 0 locally generated, 59 forwarded
0 no route, 0 discards
Frag: 0 reassemble required, 0 reassembled, 0 couldn’t reassemble
0 created, 0 fragmented, 0 couldn’t fragment

show isdn-group <*number*>

Use the **show isdn-group** command to display integrated services digital network (ISDN) group information.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<number>	Displays information for a specific ISDN group. Valid range is **1** to **255**.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays information for ISDN group **5**:

```
>enable
#show isdn-group 5
```

show isdn-number-template

Use the **show isdn-number-template** command to display integrated services digital network (ISDN) number templates. Variations of this command include:

show isdn-number-template
show isdn-number-template *<value>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<value>	Optional. Displays information about a specific number template. Valid range is **1** to **255**.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays information for ISDN number template **0**:

```
>enable
#show isdn-number-template 0
Type          ID      Prefix    Pattern
Subscriber    0                 911
#
```

show isdn resource

Use the **show isdn resource** command to display integrated services digital network (ISDN) resource information. Variations of this command include:

show isdn resource
show isdn resource realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays ISDN resource information:

>enable
#show isdn resource

Interface: ChannelId	Channel State:GID	Trunk: Appearance	Appearance State	Slot/Prt: B-Channel	Call State
pri 1:0	Reserved:1	T01:2	TAS_Connect	1/1:21	OutgoingConnect
pri 1:1	Reserved:1	T01:0	TAS_Alerting	1/1:23	IncomingAlertingSent
pri 1:2	Available	---	---	---	---
pri 1:3	Available	---	---	---	---
pri 1:4	Available	---	---	---	---
pri 1:5	Available	---	---	---	---
pri 1:6	Available	---	---	---	---
pri 1:7	Available	---	---	---	---
pri 1:8	Available	---	---	---	---
pri 1:9	Available	---	---	---	---
pri 1:10	Available	---	---	---	---
pri 1:11	Available	---	---	---	---
pri 1:12	Available	---	---	---	---
pri 1:13	Available	---	---	---	---
pri 1:14	Available	---	---	---	---
pri 1:15	Available	---	---	---	---
pri 1:16	Available	---	---	---	---
pri 1:17	Available	---	---	---	---
pri 1:18	Available	---	---	---	---
pri 1:19	Available	---	---	---	---
pri 1:20	Available	---	---	---	---
pri 1:21	Available	---	---	---	---
pri 1:22	Available	---	---	---	---

show license

Use the **show license** command to display AOS feature license information including: errors, features, keys, request keys, status and usage. Variations of this command include:

show license [verbose]
show license errors
show license features
show license keys
show license request key
show license status current [verbose]
show license status deprecated [verbose]
show license status inactive [verbose]
show license status installed [verbose]
show license status obsolete [verbose]
show license status partial
show license status reboot [verbose]
show license status remove [verbose]
show license status running [verbose]
show license time
show license usage

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

errors	Optional. Displays the license errors detected during startup.
features	Optional. Displays all licensable features available on the unit.
keys	Optional. Displays archived license keys.
request key	Optional. Displays the current license request key.
status	Displays the license status information.
current	Displays the status of current licenses.
deprecated	Displays the status of deprecated licenses.
inactive	Displays the status of inactive licenses.
installed	Displays the status of installed licenses.
obsolete	Displays the status of obsolete licenses.
partial	Displays information for licenses that have a mixture of statuses.
reboot	Displays the status of licenses that will activate upon reboot.

remove	Displays the status of licenses that will be removed upon reboot.
running	Displays the status of currently active licenses.
time	Optional. Displays time-based information about the license (such as expiration).
usage	Optional. Displays license usage information.
verbose	Optional. Displays detailed license information.

Default Values

No default values are necessary for this command.

Command History

Release R11.8.0	Command was introduced.
Release R12.1.0	Command was expanded to include the **time** parameter. In addition, command output was modified for virtual AOS (vAOS) instances.

Functional Notes

AOS uses two types of keys for enabling additional licensed AOS features. The license key is requested from the Adtran licensing portal and installed on the AOS device in order to activate additional features. This process of requesting a license key requires a second key, called a license request key (or a challenge key). The license request key is a unique key generated by AOS and contains information about the unit that validates it for a one time use only. Once a license key has been installed, the license request key is cleared and no longer valid.

The **license request key** command will not display a key until the **license request key generate** command has been issued for the first time. Generating a new license request key clears any previous license request keys, whether or not they were used through the Adtran licensing portal.

Usage Examples

The following is sample output from the **show license keys** command:

>**enable**
#show license keys

********License Status: Current********

-----BEGIN LICENSE KEY-----
License Serial Num: 12345678
License Part Num: 1962SBCF50

show lldp

Use the **show lldp** command to display the Link Layer Discovery Protocol (LLDP) transmit interval and transmitted time to live (TTL).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

The TTL is calculated by multiplying the transmit interval by the TTL multiplier. For more information, refer to the command *lldp on page 1573*.

Usage Examples

The following is sample output for the LLDP timer configuration:

```
>enable
#show lldp
Global LLDP information:
Sending LLDP packets every 30 seconds
Sending TTL of 120 seconds
```

show lldp device <*name*>

Use the **show lldp device** command to display neighbor information about an adjacent device on the same IEEE 802 local area network (LAN).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Specifies the system name of the neighbor to display.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

If there is more than one neighbor with the same system name, all neighbors with that system name will be displayed.

Usage Examples

The following example shows specific information about a neighbor for the system name **Router**:

```
>enable
#show lldp device Router
Chassis ID: 00:A0:C8:02:DD:2A (MAC Address)
    System Name: Router
    Device Port: eth 0/1 (Locally Assigned)
    Holdtime: 30
    Platform: NetVanta 3305
    Software: Version: 08.00.22.sw1.D, Date: Mon Nov 01 10:28:55 2004
    Capabilities: Bridge, Router
    Enabled Capabilities: Router
    Local Port: eth 0/3
    Management Addresses:
    Address Type: IP version 4, Address: 10.23.10.10
```

show lldp interface

Use the **show lldp interface** command to display Link Layer Discovery Protocol (LLDP) configuration and statistics for interfaces on this device. Variations of this command include:

show lldp interface
show lldp interface *<interface>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Optional. Displays the information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show lldp interface ?** for a complete list of applicable interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet and gigabit switchport interfaces.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example shows LLDP statistics for the Ethernet 0/1 interface:

>**enable**
#show lldp interface ethernet 0/1
eth 0/1 (TX/RX)
    0 packets input
    0 input errors
    0 TLV errors, 0 TLVs Discarded
    0 packets discarded
    8799 packets output
    0 neighbor ageouts

show lldp neighbors

Use the **show lldp neighbors** command to display information about neighbors of this device learned about via Link Layer Discovery Protocol (LLDP). Variations of this command include:

show lldp neighbors
show lldp neighbors detail
show lldp neighbors <*interface*>
show lldp neighbors interface <*interface*> **detail**
show lldp neighbors med
show lldp neighbors realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

detail	Optional. Shows detailed neighbor information for all LLDP neighbors or neighbors connected to the specified interface or interface type.
interface <*interface*>	Optional. Displays a summary of all neighbors learned about through the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show lldp neighbors interface ?** for a complete list of applicable interfaces.
med	Optional. Displays neighbors that are capable of supporting LLDP-Media Endpoint Discovery (LLDP-MED).
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.2	Command was expanded to include the **med** parameter.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet and gigabit switchport interfaces.
Release R11.5.0	Command was expanded to include inventory information if transmitted by the endpoint when using the **detail** parameter.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example shows detailed information about a device's neighbors:

```
>enable
#show lldp neighbors interface eth 0/3 detail
Chassis ID: 00:A0:C8:02:DD:2A (MAC Address)
 System Name: Router
 Device Port: eth 0/1 (Locally Assigned)
 Holdtime: 38
 Platform: NetVanta 3305
 Software: Version: 08.00.22.sw1.D, Date: Mon Nov 01 10:28:55 2004
 Capabilities: Bridge, Router
 Enabled Capabilities: Router
 Local Port: eth 0/3
 Management Addresses:
   Address Type: IP version 4, Address: 10.23.10.10
Interface Type: Interface Index, Interface Id: 2
```

The following example shows LLDP-MED capable neighbors connected to a device:

```
>enable
#show lldp neighbors med
Capability Codes: R - Router, B - Bridge, H - Host, D - DOCSIS Device,
                  W - WLAN Access Point, r - Repeater, T - Telephone

System Name                      Port ID                  TTL       Cap.       Platform           Local Int
-------------------------------- ------------------------ --------- ---------- ------------------ ----------------
URL 5000@10.22.41                08:00:0F:2C:AB            96       --B--T--                      swx 0/2
```

show lldp neighbors statistics

Use the **show lldp neighbors statistics** command to display statistics about Link Layer Discovery Protocol (LLDP) neighbor table actions.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

This command shows information about the changes in this device's neighbor table. The information displayed indicates the last time a neighbor was added to or removed from the table, as well as the number of times neighbors were inserted into or deleted from the table.

System Last Change Time	Shows the time at which the most recent change occurred in the neighbor table.
Inserts	Shows the number of times neighbors have been added to the table.
Deletes	Shows how many times neighbors have been deleted from the table because an interface was shut down.
Drops	Shows how many times the insertion of a new neighbor into the table failed because the table was full.
Age Outs	Shows how many times neighbors have been removed from the table because no new updates were received from that neighbor before its time to live (TTL) timer expired.

Usage Examples

The following is sample output for this command:

>**enable**
#show lldp neighbors statistics

System Last Change Time	Inserts	Deletes	Drops	Age Outs
10-15-2004 14:24:56	55	3	1	1

show load-protect

Use the **show load-protect** command to display configuration parameters and current statistics for the load protect feature.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.10.0	Command was introduced.

Usage Examples

The following is sample output from the **show load-protect** command:

#show load-protect

```
Mode: cli
Timeout: 300ms
Congestion method: percentage increase/decrease
increase percentage: 10%
decrease percentage: 90%

show logging forwarding

Use the **show logging forwarding** command to display current configuration settings for the logging forwarding feature. The AOS syslog event feature is enabled using the command *logging forwarding on on page 1600*.

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R12.3.0	Command was introduced.

Usage Examples

To display the current configuration of logging forwarding, enter the command as follows:

```
>enable
#show logging forwarding
```

show mac address-table

Use the **show mac address-table** command to display all static and dynamic entries in the medium access control (MAC) address table for all virtual local area networks (VLANs) and physical interfaces.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show mac address-table** command:

```
>enable
#show mac address-table
Mac Address Table
------------------------------------------
Vlan    Mac Address         Type        Ports
1       aa:bb:ee:d1:c2:33   STATIC      eth 0/18
1       00:00:00:00:00:00   STATIC      CPU
2       00:90:2b:7d:30:00   DYNAMIC     eth 0/1
2       00:a0:c8:00:8e:a6   DYNAMIC     eth 0/1
2       00:a0:c8:00:8f:ba   DYNAMIC     eth 0/1
2       00:a0:c8:00:8f:73   DYNAMIC     eth 0/1
2       00:a0:c8:00:00:00   DYNAMIC     eth 0/1
2       00:a0:c8:01:ff:02   DYNAMIC     eth 0/1
2       00:a0:c8:01:09:d3   DYNAMIC     eth 0/1
2       00:a0:c8:01:13:34   DYNAMIC     eth 0/1
2       00:a0:c8:01:14:4a   DYNAMIC     eth 0/1
2       00:a0:c8:03:95:4b   DYNAMIC     eth 0/1
2       00:a0:c8:05:00:89   DYNAMIC     eth 0/1
```

show mac address-table address

Use the **show mac address-table address** command to display all medium access control (MAC) addresses known by AOS. Variations of this command include the following:

show mac address-table address <*mac address*>
show mac address-table address <*mac address*> **interface** <*interface*>
show mac address-table address <*mac address*> **interface** <*interface*> **vlan** <*vlan id*>
show mac address-table address <*mac address*> **vlan** <*vlan id*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*mac address*>	Specifies a valid 48-bit MAC address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
interface <*interface*>	Optional. Shows information for a specific interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show mac address-table address interface ?** for a list of valid interfaces.
vlan <*vlan id*>	Optional. Specifies a valid virtual local area network (VLAN) interface ID. Range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show mac address-table address** command displays information regarding a specific MAC address from the MAC address table:

```
>enable
#show mac address-table address 00:a0:c8:7d:30:00
Mac Address Table
------------------------------------------
Vlan    Mac Address          Type         Ports
--------  -------------------  ---------  -----------
2       00:a0:c8:7d:30:00    DYNAMIC    eth 0/1
```

The following is sample output from the **show mac address-table address** command displays information regarding a specific MAC address and interface from the MAC address table:

```
>enable
#show mac address-table address 00:a0:c8:7d:30:00 ethernet 0/1
Mac Address Table
------------------------------------------
Vlan    Mac Address          Type         Ports
--------  -------------------  ---------  -----------
2       00:a0:c8:7d:30:00    DYNAMIC    eth 0/1
Total Mac Addresses for this criterion: 1
#
```

show mac address-table aging-time

Use the **show mac address-table aging-time** command to display information regarding the amount of time dynamic entries remain in the medium access control (MAC) address table.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show mac address-table aging-time** command for a switch configured with an address-table aging-time:

```
>enable
#show mac address-table aging-time
Aging Time
----------
300 Seconds
```

show mac address-table count

Use the **show mac address-table count** command to display information regarding the number of medium access control (MAC) addresses in use (both static and dynamic).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show mac address-table count** command:

```
>enable
#show mac address-table count
Mac Table Entries:
--------------------------
Dynamic Address Count: 19
Static Address Count: 3
Total Mac Addresses: 23
Total Mac Address Space Available: 8169
```

show mac address-table dynamic

Use the **show mac address-table dynamic** command to display all dynamic medium access control (MAC) addresses learned by AOS. Variations of this command include the following:

show mac address-table dynamic
show mac address-table dynamic address *<mac address>*
show mac address-table dynamic address *<mac address>* **interface** *<interface>*
show mac address-table dynamic address *<mac address>* **interface** *<interface>* **vlan** *<vlan id>*
show mac address-table dynamic address *<mac address>* **vlan** *<vlan id>*
show mac address-table dynamic interface *<interface>*
show mac address-table dynamic interface *<interface>* **vlan** *<vlan id>*
show mac address-table dynamic vlan *<vlan id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

address *<mac address>*	Optional. Specifies a valid 48-bit MAC address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
interface *<interface>*	Optional. Shows information for a specific interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show mac address-table dynamic interface ?** for a list of valid interfaces.
vlan *<vlan id>*	Optional. Specifies a valid virtual local area network (VLAN) interface ID. Range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show mac address-table dynamic** command:

```
>enable
#show mac address-table dynamic
Mac Address Table
----------------------------
Vlan    Mac Address          Type        Ports
-------  -------------------  --------    --------
 1       00:a0:c8:7d:30:00    DYNAMIC     eth 0/1
 1       00:a0:c8:05:89:09    DYNAMIC     eth 0/2
 1       00:a0:c8:07:d9:d2    DYNAMIC     eth 0/5
 1       00:a0:c8:07:d9:19    DYNAMIC     eth 0/7
 1       00:a0:c8:09:95:6b    DYNAMIC     eth 0/7
 1       00:a0:c8:0a:2d:7c    DYNAMIC     eth 0/12
 1       00:a0:c8:f6:e9:a6    DYNAMIC     eth 0/24
 1       00:a0:c8:01:0a:ef    DYNAMIC     eth 0/23
 1       00:a0:c8:0c:74:80    DYNAMIC     eth 0/20
 1       00:a0:c8:15:5a:9f    DYNAMIC     eth 0/7
 1       00:a0:c8:6c:71:49    DYNAMIC     eth 0/2
 1       00:a0:c8:77:78:c1    DYNAMIC     eth 0/3
 1       00:a0:c8:6b:53:7b    DYNAMIC     eth 0/4
 1       00:a0:c8:72:e6:d6    DYNAMIC     giga-eth 0/2
 1       00:a0:c8:05:00:e6    DYNAMIC     giga-eth 0/1
Total Mac Addresses for this criterion: 15
```

show mac address-table interface

Use the **show mac address-table interface** command to display information regarding medium access control (MAC) address table entries specific to a certain interface. Variations of this command include:

show mac address-table interface <*interface*>
show mac address-table interface <*interface*> **vlan** <*vlan id*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*interface*>	*Shows information for a specific interface type.* Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. *Type* **show mac address-table interface ?** *for a list of valid interfaces.*
vlan <*vlan id*>	Optional. Shows address-table information related to a specific virtual local area network (VLAN). Valid range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show mac address-table interface eth 0/1** command displaying MAC address-table entries specifically on Ethernet 0/1:

>**enable**
#show mac address-table interface ethernet 0/1
Mac Address Table

Vlan	Mac Address	Type	Ports
2	00:90:2b:7d:30:00	DYNAMIC	eth 0/1
2	00:a0:c8:05:00:ac	DYNAMIC	eth 0/1
2	00:a0:c8:05:00:ad	DYNAMIC	eth 0/1
2	00:a0:c8:05:00:c2	DYNAMIC	eth 0/1
2	00:a0:c8:05:01:6e	DYNAMIC	eth 0/1
2	00:a0:c8:09:95:6b	DYNAMIC	eth 0/1
2	00:a0:c8:0a:2d:7c	DYNAMIC	eth 0/1

Total Mac Addresses for this criterion: 7

show mac address-table multicast

Use the **show mac address-table multicast** command to display all multicast medium access control (MAC) addresses known by AOS. Variations of this command include the following:

show mac address-table multicast
show mac address-table multicast count
show mac address-table multicast igmp-snooping
show mac address-table multicast igmp-snooping count
show mac address-table multicast user
show mac address-table multicast user count
show mac address-table multicast vlan <*vlan id*>
show mac address-table multicast vlan <*vlan id*> **count**
show mac address-table multicast vlan <*vlan id*> **igmp-snooping**
show mac address-table multicast vlan <*vlan id*> **igmp-snooping count**
show mac address-table multicast vlan <*vlan id*> **user**
show mac address-table multicast vlan <*vlan id*> **user count**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

count	Optional. Displays the multicast address count.
igmp-snooping	Optional. Displays MAC addresses learned via Internet Group Management Protocol (IGMP) snooping.
user	Optional. Displays static MAC addresses entered by the user.
vlan <*vlan id*>	Optional. Displays address table information related to a specific virtual local area network (VLAN). Valid range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 14.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show mac address-table multicast** command:

```
>enable
#show mac address-table multicast
Multicast Mac Address Table
-----------------------------------------
Vlan    Mac Address             Type        Ports
------  ------------------      --------    --------
1       01:00:5e:00:01:01         igmp      swx 0/10
1       01:00:5e:7f:ff:fa         igmp      swx 0/24
Total Mac Addresses for this criterion: 2
```

show mac address-table static

Use the **show mac address-table static** command to display all static medium access control (MAC) addresses known by AOS. Variations of this command include the following:

show mac address-table static
show mac address-table static address *<mac address>*
show mac address-table static address *<mac address>* **interface** *<interface>*
show mac address-table static address *<mac address>* **interface** *<interface>* **vlan** *<vlan id>*
show mac address-table static address *<mac address>* **vlan** *<vlan id>*
show mac address-table static interface *<interface>*
show mac address-table static interface *<interface>* **vlan** *<vlan id>*
show mac address-table static vlan *<vlan id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

address *<mac address>*	Optional. Specifies a valid 48-bit MAC address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
interface *<interface>*	Optional. Shows information for a specific interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show mac address-table static interface ?** for a list of valid interfaces.
vlan *<vlan id>*	Optional. Shows address-table information related to a specific virtual local area network (VLAN). Valid range is **1** to **4094**.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show mac address-table static** command:

```
>enable
#show mac address-table static
Mac Address Table
Vlan    Mac Address          Type       Ports
------  -------------------  --------   --------
 1      00:a0:c8:00:88:40    STATIC     CPU
Total Mac Addresses for this criterion: 1
```

show mac limits

Use the **show mac limits** command to display the configured maximum allowed media access control (MAC) addresses on the AOS device. The current number of MAC addresses and learned MAC addresses for each interface are displayed.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example displays the MAC addresses associated with each configured interface:

```
>enable
#show mac limits
```

Port	Max Allowed	Current	Learned
Gigabit-Ethernet 0/1	Disabled		
Gigabit-Ethernet 0/2	5	2	
Gigabit-Ethernet 0/3	10	1	
Gigabit-Ethernet 0/4	Disabled		
Gigabit-Ethernet 0/5	10	0	
Global Limit	1024	3	

show mail-client

Use the **show mail-client** command to display statistical summary information for mail agents. Variations of this command include:

show mail-client

show mail-client *<agent name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<agent name>	Optional. Specifies only statistics for the named mail agent are displayed.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example displays statistical information for mail agent **myagent**:

```
>enable
#show mail-client myagent
Mail-client myagent is ENABLED
    Capture output when track mail becomes PASS
    Send message when track T becomes PASS
    Send TO: joesmith@company.com

    6 output captures triggered
      18 commands captured
      6 command errors
         2 unrecognized commands
         4 truncated commands
    5 emails sent
    Last email sent on 2/29/2008 at 16:20:10 PM
```

show mail-client body <*agent name*>

Use the **show mail-client body** command to display the current buffer content for the body of the email message in queue for a specific mail agent.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*agent name*>	Specifies the mail agent buffer to display.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example displays the email body buffer content for **myagent** mail agent:

```
>enable
#show mail-client body myagent
```

show media-gateway

Use the **show media-gateway** command to show cumulative totals for all Realtime Transport Protocol (RTP) channels. Variations of this command include:

show media-gateway
show media-gateway channel
show media-gateway channel <*slot/dsp.channel*>
show media-gateway info
show media-gateway session
show media-gateway session <*slot/dsp.channel*>
show media-gateway summary
show media-gateway summary active

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*slot/dsp.channel*>	Optional. Specifies the ID of the media gateway channel to be displayed in the format *slot/dsp.channel*.
channel	Optional. Shows cumulative totals for individual RTP channels.
info	Optional. Shows media-gateway information.
session	Optional. Shows current RTP sessions.
summary	Optional. Shows summary of last active and current RTP sessions.
active	Optional. Shows summary of currently active RTP sessions.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show media-gateway** command:

```
>enable
#show media-gateway

Media Gateway
  1 slots, 2 DSPs, 60 channels
  6 total sessions, 1 active sessions,
  00:00:11 total session duration
  Last clearing of counters: never
Receive
  601 total rx packets, 96160 total rx bytes
  Jitter Buffer Totals:
  0 out of order packets
  0 early arrival discards
  0 late arrival discards
  0 buffer full discards
  0 unknown packets
  13 flushed packets
Transmit
  647 total tx packets, 103520 total tx bytes
#
```

The following example shows sample output from the **show media-gateway info** command:

```
>enable
#show media-gateway info
slot 0, DSP 1
   DSP software version: G2.R10.5.0.0
   DSP hardware version: Freescale MSC7119
   DSP utilization: 49%
   maximum DSP utilization: 52%
   free packet buffers: 5998
   total channels: 30
   active channels: 0
   DSP uptime: 2d 23:42:10

slot 0, DSP 2
   DSP software version: G2.R10.5.0.0
   DSP hardware version: Freescale MSC7119
   DSP utilization: 49%
   maximum DSP utilization: 51%
   free packet buffers: 5998
   total channels: 30
   active channels: 0
   DSP uptime: 2d 23:42:04

    system uptime: 2d 23:42:18
```

show mef

Use the **show mef** command to display Metro Ethernet Forum (MEF) Ethernet component configuration and state information. Variations of this command include:

show mef
show mef connections
show mef connections discard
show mef connections evc <*name*>
show mef connections evc-map <*name*>
show mef connections men-port efm-group <*group id*>
show mef connections policer <*name*>
show mef connections uni mef-ethernet <*name*>
show mef evc-map
show mef evc-map <*name*>
show mef evc
show mef evc <*name*>
show mef policer
show mef policer <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

connections	Optional. Displays information on all MEF Ethernet connections.
discard	Optional. Displays discard connections.
evc <*name*>	Optional. Displays connection information on the specified Ethernet virtual connection (EVC).
evc-map <*name*>	Optional. Displays connection information on the specified EVC map.
men-port efm-group <*group id*>	Optional. Displays connection information for the specified Metro Ethernet network (MEN) Ethernet in the first mile (EFM) group.
policer <*name*>	Optional. Displays connection information on the specified EVC policer profile.
uni mef-ethernet <*name*>	Optional. Displays connection information on the specified user network Metro Ethernet interface.
evc-map	Optional. Displays the MEN priority and MEN queue information for all configured EVC maps.

evc-map <*name*>	Optional. Displays the MEN priority and MEN queue information for the specified EVC map.
evc	Optional. Displays status, s-tag, CE VLAN preservation, and connected EVC map information for all configured EVCs.
evc <*name*>	Optional. Displays status, s-tag, CE VLAN preservation, and connected EVC map information for the specified EVC.
policer	Optional. Displays configuration information for all EVC policer policies.
policer <*name*>	Optional. Displays configuration information for the specified EVC policer policy.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following is sample output from the **show mef** command:

```
#show mef
MEN Configured EVCs for efm-group 1 :
2213 3216

EVC DATA : Admin UP Protocol Connected UP

Connected to MEN Port efm-group 1
Connected to EVC Map DATA

Tag 3216
Preserve CE VLAN No

EVC DEFAULT : Admin UP Protocol Connected UP
Connected to MEN Port efm-group 1
Connected to EVC Map DEFAULT
Tag 2213
Preserve CE VLAN Yes

EVC Map DATA : Admin UP Protocol Connected UP
Connected to UNI mef-ethernet 1/1
Connected to EVC DATA
MEN Priority Inherit
MEN Queue Inherit
```

EVC Map DEFAULT : Admin UP Protocol Connected UP
Connected to UNI mef-ethernet 1/1
Connected to EVC DEFAULT
MEN Priority Inherit
MEN Queue Inherit

Connection : EVC Map DATA
UNI mef-ethernet 1/1
EVC DATA
MEN Port efm-group 1
Connection Status Connected UP

Connection : EVC Map DEFAULT
UNI mef-ethernet 1/1
EVC DEFAULT
MEN Port efm-group 1
Connection Status Connected UP#

show memory

Use the **show memory** command to display statistics regarding memory, including memory allocation and buffer use statistics. Shows how memory is in use (broken down by memory size) and how much memory is free. Variations of this command include:

show memory heap
show memory heap realtime
show memory uncached-heap

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

heap	Shows how much memory is in use (broken down by memory block size) and how much memory is free.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
uncached-heap	Shows how much memory has been set aside to be used without memory caching, how much memory is being used, and how much memory is free.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show memory heap** command:

>**enable**
#show memory heap
Memory Heap:
  HeapFree: 2935792
  HeapSize: 8522736
Block Managers:

Mgr	Size	Used	Free	Max-Used
0	0	58	0	58
1	16	1263	10	1273
2	48	1225	2	1227
3	112	432	2	434
4	240	140	3	143
5	496	72	2	74
6	1008	76	1	26
7	2032	25	1	26
8	4080	2	1	3
9	8176	31	1	32
10	16368	8	0	8
11	32752	5	1	6
12	65520	3	0	30
13	131056	0	0	0

show mgcp-endpoint

Use the **show mgcp-endpoint** command to display configuration statistics for all configured Media Gateway Control Protocol (MGCP) endpoints. Variations of this command include:

show mgcp-endpoint
show mgcp-endpoint verbose

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

verbose	Optional. Enables detailed messaging.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Usage Examples

The following is sample output from the **show mgcp-endpoint** command:

```
#show mgcp-endpoint
        Endpoint: 1
        Name   : aaln/1
        FXS    : 0/1
        State  : Connected

        Endpoint: 2
        Name   : aaln/2
        FXS    : 0/2
        State  : Connected

        Endpoint: 3
        Name   : aaln/3
        FXS    : 0/3
        State  : Connected

        Endpoint: 4
        Name   : aaln/4
        FXS    : 0/4
        State  : Connected
```

show modules

Use the **show modules** command displays information on the current system setup. Variations of this command include:

show modules
show modules detailed

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detailed	Optional. Displays more detailed information in the output.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.1.0	Command was expanded to include the **detailed** parameter.
Release R12.1.0	Command output was modified for virtual AOS (vAOS) instances.

Usage Examples

The following example displays the modules installed in the unit.

```
>enable
#show modules
```

Slot	Port	Type	Part Number	Software Version
0	1	VPN Module	1202368L1	R10.11.0.E
1	1	T3 WAN	Not Available	Not Available
2	1	E1 VIM	Not Available	Not Available

show monitor session

Use the **show monitor session** command to display information regarding a specified monitor session or to display this information for all sessions. Variations of this command include:

show monitor session <*number*>
show monitor session all

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*number*>	Displays information for a single specific monitor session.
all	Displays all sessions.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show monitor session** command:

```
>enable
#show monitor session 1
Monitor Session 1
-----------------
Source Ports:
   RX Only:   None
   TX Only:   None
   Both:      eth 0/2, eth 0/3
Destination Port: eth 0/6
```

show name-server

Use the **show name-server** command to display the current domain naming system (DNS) name server's address and the source of its addresses. Address sources include Dynamic Host Control Protocol version 4 (DHCPv4), DHCP version 6 (DHCPv6), Point-to-Point Protocol and Internet Protocol Control Protocol (PPP-IPCP), and user configured addresses. Variations of this command include:

show name-server
show name-server realtime
show name-server vrf <*name*>
show name-server vrf <*name*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

realtime	Optional. Displays the name server information in real time.
vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance for which to display name server address information. If a VRF instance is not specified, name server information for the default VRF instance is displayed.

Default Values

No default values are necessary for this command.

Command History

Release 18.3	Command was introduced.

Usage Examples

The following example shows output from the **show name-server** command:

```
>enable
#show name-server
 Current          Name server address                  Source
 ------------------------------------------------------------------------------------------------
                  2000:ef0a::1500:37ag:362:ed          DHCPv6
   proxy -->      2000:a50:1a0e::1500:eddf             DHCPv6
                  10.23.115.254                        DHCPv4
   client -->     192.168.101.1                        PPP
                  8.8.8.8                              User
                  8.8.4.4                              User
```

show network-forensics ip dhcp

Use the **show network-forensics ip dhcp** command to display collected Dynamic Host Configuration Protocol (DHCP) information for clients connected to the network. The display of the collected information can be for all connected clients or for a specific client. Variations of this command include:

show network-forensics ip dhcp
show network-forensics ip dhcp hostname <*hostname*>
show network-forensics ip dhcp interface gigabit-switchport <*slot/port*>
show network-forensics ip dhcp ip <*ip address*>
show network-forensics ip dhcp mac <*mac address*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

hostname <*hostname*>	Optional. Displays DHCP information for the client with the specified host name.
interface gigabit-switchport <*slot/port*>	Optional. Displays DHCP information for the client using the specified interface.
ip <*ip address*>	Optional. Displays DHCP information for the client at the specified IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
mac <*mac address*>	Optional. Displays DHCP information for the client at the specified medium access control (MAC) address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.

Usage Examples

The following is sample output from the **show network-forensics ip dhcp** command:

```
#show network-forensics ip dhcp
Client MAC/IP/Host: 00:E0:29:0E:D5:E3 / 10.23.220.1 / xpsp3-host
    VLAN ID: 100
    Source Port: gigabit-switchport 0/2
    Server Mac/IP: 00:E0:29:0E:D5:E5 / 10.23.220.254
    Lease from Time Collected: 3 days from 25 Aug 2009 10:33:42
    Client Vendor Class: unknown
```

The preceding output is for one client. This same information will be displayed for all connected clients unless one of the filtering parameters is used in conjunction with the ***show network-forensics ip dhcp*** *command.*

show network-sync

Use the **show network-sync** command to display the status of the network synchronization (Network Sync) configuration. Variations of this command include:

show network-sync
show network-sync detail

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays details about the configuration.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example displays the status of the Network Sync configuration:

```
>enable
#show network-sync
Network Sync Status
Primary Source              gigabit-ethernet 0/1
    Health                  Down
Secondary Source            gigabit-ethernet 0/2
    Health                  Down
Current Source              Holdover
Revertive Mode              Priority
EEC Option                  EEC Option 1
ESMC Process                Enabled
Holdover Threshold          Threshold Holdover when clock source SSM < QL-EEC1
```

show ntp associations

Use the **show ntp associations** command to display the active Network Time Protocol (NTP) associations.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example executes **show ntp associations**:

```
>enable
#show ntp associations
```

show ntp status

Use the **show ntp status** command to display general information about the status on the Network Time Protocol (NTP).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.2	Command was introduced.

Usage Examples

The following example executes **show ntp status**:

```
>enable
#show ntp status
```

show ospfv3

Use the **show ospfv3** command to display general information regarding Open Shortest Path First version 3 (OSPFv3) processes on the AOS device. Variations of this command include:

show ospfv3

show ospfv3 *<process id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from this command:

```
>enable
#show ospfv3
Summary of OSPFv3 Process 61 with ID: 5.5.5.5, VRF RED
  Supports IPv6 Address Family
  SPF delay timer: 5 seconds, Hold time between SPFs: 10 seconds
  LSA interval: 1800 seconds
  Number of external LSAs: 4, Checksum Sum: 0x22a04
  Number of AS scoped unknown LSAs: 0, Checksum Sum: 0x0
  Number of areas: 2, normal: 2, stub: 0, NSSA: 0
  Reference bandwidth unit is 100 Mbps
    Area (0) 5.5.5.5
      Number of interfaces in this area: 2
      Authentication type: 0
      SPF algorithm execution count: 2

    SPF algorithm execution count: 3
    Number of LSAs: 6, Checksum Sum: 0x39601
```

show ospfv3 database

Use the **show ospfv3 database** command to display information contained in the Open Shortest Path First version 3 (OSPFv3) link state database. Variations of this command include:

show ospfv3 database
show ospfv3 database adv-router *<router id>*
show ospfv3 database database-summary
show ospfv3 *<process id>* **database**
show ospfv3 *<process id>* **database adv-router** *<router id>*
show ospfv3 *<process id>* **database database-summary**
show ospfv3 *<process id>* *<area id>* **database**
show ospfv3 *<process id>* *<area id>* **database adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database database-summary**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.
database-summary	Optional. Displays summarized information about the OSPFv3 link state database.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database** command:

```
>enable
#show ospfv3 database
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Router Link States, Area 0
  Adv Router      Age      Seq #       Fragment ID  Link count   Bits

show ospfv3 *<process id>* **database external** *<link state id>*
show ospfv3 *<process id>* **database external** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* **database external adv-router** *<router id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<ipv6 address/prefix-length>	Optional. Limits the output of this command to a single Internet Protocol version 6 (IPv6) address. Enter IPv6 addresses in colon hexadecimal format (**X:X:X:X::X/<Z>**), for example, **2001:DB8::1/64**. The prefix length (**<Z>**) is an integer with a value between **0** and **128**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database external** command:

```
>enable
#show ospfv3 database external
External Link States

   Link State age: 689
   Link State type: AS External-LSA (0x4005)

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<ipv6 address/prefix-length>	Optional. Limits the output of this command to a single Internet Protocol version 6 (IPv6) address. Enter IPv6 addresses in colon hexadecimal format (**X:X:X:X::X/<Z>**), for example, **2001:DB8::1/64**. The prefix length (**<Z>**) is an integer with a value between **0** and **128**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.
internal	Optional. Displays the shortest path first (SPF) calculation results for the LSAs and whether the LSA was used in route calculation.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database inter-area router** command:

```
>enable
#show ospfv3 database inter-area router

OSPFv3 router with ID: 5.5.5.5 (Process ID 61, VRF RED)

  Inter Area Router Link States, Area 1

    Link State age: 394
    Link State type: Inter-Area-Prefix-LSA (0x2004)
    Link State ID: 3
    Advertising Router: 5.5.5.5
    Sequence Number: 0x80000001
    Checksum: 0x37C6
    Length: 32
      Options: V6, E, R, AF
      Metric: 1
      Destination Router: 4.4.4.4
```

show ospfv3 database link

Use the **show ospfv3 database link** command to display details from the Open Shortest Path First version 3 (OSPFv3) link state database of link state advertisements (LSAs). Variations of this command include:

show ospfv3 database link
show ospfv3 database link interface *<interface>*
show ospfv3 database link interface *<interface>* *<link state id>*
show ospfv3 database link interface *<interface>* *<link state id>* **adv-router** *<router id>*
show ospfv3 database link interface *<interface>* **adv-router** *<router id>*

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
interface *<interface>*	Optional. Limits the output of this command to a single OSPFv3 interface. Specify interfaces in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id>*. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **show ipv6 ospfv3 database link interface ?** for a list of available interfaces.
mef-ethernet *<slot/port>*	Optional. Limits the output of this command to the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Limits the output of this command to the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Limits the output of this command to the system management EVC.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following is sample output from the **show ospfv3 database link** command:

```
>enable
#show ospfv3 database link
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Link (Type-8) Link States, Area 0

    Link State age: 813
    Link State type: Link-LSA (Interface: eth 0/1.106) (0x0008)
    Link State ID: 8
    Advertising Router: 4.4.4.4
    Sequence Number: 0x80000057
    Checksum: 0xEFB2
    Length: 56
      Options: V6, E, R, DC
      Router Priority: 1
      Link-Local Address: FE80::CA9C:1DFF:FED6:E0A0
      Number of Prefixes: 1
        Prefix Address: 2001:10:24:106::
        Prefix Length: 64, Options: None

    Link State age: 438
    Link State type: Link-LSA (Interface: eth 0/1.106) (0x0008)
    Link State ID: 13
    Advertising Router: 5.5.5.5
    Sequence Number: 0x80000062
    Checksum: 0xCD3
    Length: 56
      Options: V6, E, R, AF
      Router Priority: 1
      Link-Local Address: FE80::2A0:C8FF:FE1F:CC53
      Number of Prefixes: 1
        Prefix Address: 2001:10:24:106::
        Prefix Length: 64, Options: None

  Link (Type-8) Link States, Area 1

    Link State age: 441
```

```
Link State type: Link-LSA (Interface: eth 0/2.1) (0x0008)
Link State ID: 14
Advertising Router: 5.5.5.5
Sequence Number: 0x80000001
Checksum: 0xD965
Length: 56
  --MORE--
```

show ospfv3 database network

Use the **show ospfv3 database network** command to display details from the Open Shortest Path First version 3 (OSPFv3) link state database of network link state advertisements (LSAs). Variations of this command include:

show ospfv3 database network
show ospfv3 database network *<link state id>*
show ospfv3 database network *<link state id>* **adv-router** *<router id>*
show ospfv3 database network adv-router *<router id>*
show ospfv3 *<process id>* **database network**
show ospfv3 *<process id>* **database network** *<link state id>*
show ospfv3 *<process id>* **database network** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* **database network adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database network**
show ospfv3 *<process id>* *<area id>* **database network** *<link state id>*
show ospfv3 *<process id>* *<area id>* **database network** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database network adv-router** *<router id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database network** command:

```
>enable
#show ospfv3 database network
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Network Link States, Area 0

    Link State age: 471
    Link State type: Network-LSA (0x2002)
    Link State ID: 8
    Advertising Router: 4.4.4.4
    Sequence Number: 0x80000001
    Checksum: 0xB01B
    Length: 32
      Options: V6, E, R, DC, AF
      Number of Attached Routers: 2
        Attached Router: 4.4.4.4
        Attached Router: 5.5.5.5
```

show ospfv3 database prefix

Use the **show ospfv3 database prefix** command to display details from the Open Shortest Path First version 3 (OSPFv3) link state database of intra-area link state advertisements (LSAs). Variations of this command include:

show ospfv3 database prefix
show ospfv3 database prefix ref-lsa network
show ospfv3 database prefix ref-lsa network *<link state id>*
show ospfv3 database prefix ref-lsa network *<link state id>* **adv-router** *<router id>*
show ospfv3 database prefix ref-lsa network adv-router *<router id>*
show ospfv3 database prefix ref-lsa router
show ospfv3 database prefix ref-lsa router *<link state id>*
show ospfv3 database prefix ref-lsa router *<link state id>* **adv-router** *<router id>*
show ospfv3 database prefix ref-lsa router adv-router *<router id>*
show ospfv3 *<process id>* **database prefix**
show ospfv3 *<process id>* **database prefix ref-lsa network**
show ospfv3 *<process id>* **database prefix ref-lsa network** *<link state id>*
show ospfv3 *<process id>* **database prefix ref-lsa network** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* **database prefix ref-lsa network adv-router** *<router id>*
show ospfv3 *<process id>* **database prefix ref-lsa router**
show ospfv3 *<process id>* **database prefix ref-lsa router** *<link state id>*
show ospfv3 *<process id>* **database prefix ref-lsa router** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* **database prefix ref-lsa router adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database prefix**
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa network**
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa network** *<link state id>*
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa network** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa network adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa router**
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa router** *<link state id>*
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa router** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database prefix ref-lsa router adv-router** *<router id>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
ref-lsa	Optional. Limits the output of this command to all referenced LSAs.
network	Optional. Limits the output of this command to referenced network LSAs.
router	Optional. Limits the output of this command to referenced router LSAs.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database prefix** command:

```
>enable
#show ospfv3 database prefix
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Intra Area Prefix Link States, Area 0

    Link State age: 539
    Link State type: Intra-Area-Prefix-LSA (0x2009)
    Link State ID: 8192
    Advertising Router: 4.4.4.4
    Sequence Number: 0x80000001
    Checksum: 0x1809
    Length: 44
      Referenced LSA Type: 0x2002
      Referenced Link State ID: 8
      Referenced Advertising Router: 4.4.4.4
      Number of Prefixes: 1
        Prefix Address: 2001:10:24:106::
        Prefix Length: 64, Options: None, Metric: 0

  Intra Area Prefix Link States, Area 1

    Link State age: 497
```

```
Link State type: Intra-Area-Prefix-LSA (0x2009)
Link State ID: 0
Advertising Router: 5.5.5.5
Sequence Number: 0x80000003
Checksum: 0x44FA
Length: 44
  Referenced LSA Type: 0x2001
  Referenced Link State ID: 0
  Referenced Advertising Router: 5.5.5.5
  Number of Prefixes: 1
    Prefix Address: 2001:10:24:205::
    Prefix Length: 64, Options: None, Metric: 1
```

show ospfv3 database router

Use the **show ospfv3 database router** command to display details from the Open Shortest Path First version 3 (OSPFv3) link state database of router link state advertisements (LSAs). Variations of this command include:

show ospfv3 database router
show ospfv3 database router internal
show ospfv3 database router *<link state id>*
show ospfv3 database router *<link state id>* **internal**
show ospfv3 database router *<link state id>* **adv-router** *<router id>*
show ospfv3 database router *<link state id>* **adv-router** *<router id>* **internal**
show ospfv3 database router adv-router *<router id>*
show ospfv3 database router adv-router *<router id>* **internal**
show ospfv3 *<process id>* **database router**
show ospfv3 *<process id>* **database router internal**
show ospfv3 *<process id>* **database router** *<link state id>*
show ospfv3 *<process id>* **database router** *<link state id>* **internal**
show ospfv3 *<process id>* **database router** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* **database router** *<link state id>* **adv-router** *<router id>* **internal**
show ospfv3 *<process id>* **database router adv-router** *<router id>*
show ospfv3 *<process id>* **database router adv-router** *<router id>* **internal**
show ospfv3 *<process id>* *<area id>* **database router**
show ospfv3 *<process id>* *<area id>* **database router internal**
show ospfv3 *<process id>* *<area id>* **database router** *<link state id>*
show ospfv3 *<process id>* *<area id>* **database router** *<link state id>* **internal**
show ospfv3 *<process id>* *<area id>* **database router** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database router** *<link state id>* **adv-router** *<router id>* **internal**
show ospfv3 *<process id>* *<area id>* **database router adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database router adv-router** *<router id>* **internal**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.

adv-router <*router id*>	Optional. Limits the output of this command to a single specified advertising router.
internal	Optional. Displays the shortest path first (SPF) calculation results for the LSAs and whether the LSA was used in route calculation.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database router** command:

```
>enable
#show ospfv3 database router
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Router Link States, Area 0

    Link State age: 575
    Link State type: Router-LSA (0x2001)
    Link State ID: 0
    Advertising Router: 4.4.4.4
    Sequence Number: 0x8000005A
    Checksum: 0x4F23
    Length: 40
      Options: V6, E, R, DC
      Flags: Area Border Router, AS Boundary Router
      Number of Links: 1
        Link connected to: Transit network Link
          Link Metric: 1
          Local Interface ID: 8
          Neighbor (DR) Interface ID: 8
          Neighbor (DR) Router ID: 4.4.4.4

    Link State age: 568
    Link State type: Router-LSA (0x2001)
    Link State ID: 0
    Advertising Router: 5.5.5.5
    Sequence Number: 0x80000066
    Checksum: 0xA3D8
    Length: 40
      Options: V6, E, R, AF
      Flags: Area Border Router, AS Boundary Router
      Number of Links: 1
```

```
    Link connected to: Transit network Link
      Link Metric: 1
      Local Interface ID: 13

show ospfv3 <*process id*> <*area id*> **database unknown**
show ospfv3 <*process id*> <*area id*> **database unknown as**
show ospfv3 <*process id*> <*area id*> **database unknown area**
show ospfv3 <*process id*> <*area id*> **database unknown link**
show ospfv3 <*process id*> <*area id*> **database unknown** <*link state id*>
show ospfv3 <*process id*> <*area id*> **database unknown** <*link state id*> **as**
show ospfv3 <*process id*> <*area id*> **database unknown** <*link state id*> **area**
show ospfv3 <*process id*> <*area id*> **database unknown** <*link state id*> **link**

show ospfv3 *<process id>* *<area id>* **database unknown** *<link state id>* **adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database unknown** *<link state id>* **adv-router** *<router id>* **as**
show ospfv3 *<process id>* *<area id>* **database unknown** *<link state id>* **adv-router** *<router id>* **area**
show ospfv3 *<process id>* *<area id>* **database unknown** *<link state id>* **adv-router** *<router id>* **link**
show ospfv3 *<process id>* *<area id>* **database unknown adv-router** *<router id>*
show ospfv3 *<process id>* *<area id>* **database unknown adv-router** *<router id>* **as**
show ospfv3 *<process id>* *<area id>* **database unknown adv-router** *<router id>* **area**
show ospfv3 *<process id>* *<area id>* **database unknown adv-router** *<router id>* **link**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<link state id>	Optional. Limits the output of this command to a single specified LSA.
adv-router *<router id>*	Optional. Limits the output of this command to a single specified advertising router.
as	Optional. Filters the output of this command by unknown LSA autonomous systems (AS).
area	Optional. Filters the output of this command by unknown LSA areas.
link	Optional. Filters the output of this command by unknown LSA links.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 database unknown** command:

```
>enable
#show ospfv3 database unknown
OSPFv3 router with ID: 4.4.4.4 (Process ID 61, VRF RED)

  Unknown Link States, Area 603979776

    Link State age: 273
    Link State type: Unknown (0x3FFF)
    Link State ID: 1
    Advertising Router: 10.80.52.106
    Sequence Number: 0x808DE8B1
    Checksum: 0xF1AE
    Length: 40
      Scope: Link Local
```

show ospfv3 interface

Use the **show ospfv3 interface** command to display Open Shortest Path First version 3 (OSPFv3) information related to router interfaces. Variations of this command include:

show ospfv3 interface
show ospfv3 interface *<interface>*
show ospfv3 interface mef-ethernet *<slot/port>*
show ospfv3 interface system-control-evc
show ospfv3 interface system-management-evc
show ospfv3 *<process id>* **interface**
show ospfv3 *<process id>* **interface** *<interface>*
show ospfv3 *<process id>* **interface mef-ethernet** *<slot/port>*
show ospfv3 *<process id>* **interface system-control-evc**
show ospfv3 *<process id>* **interface system-management-evc**
show ospfv3 *<process id>* *<area id>* **interface**
show ospfv3 *<process id>* *<area id>* **interface** *<interface>*
show ospfv3 *<process id>* *<area id>* **interface mef-etherent** *<slot/port>*
show ospfv3 *<process id>* *<area id>* **interface system-control-evc**
show ospfv3 *<process id>* *<area id>* **interface system-management-evc**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<area id>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.
<interface>	Optional. Limits the output of this command to a single OSPFv3 interface. Specify interfaces in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id>*. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **show ospfv3 interface ?** for a list of available interfaces.
mef-ethernet *<slot/port>*	Optional. Limits the output of this command to the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Limits the output of this command to the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Limits the output of this command to the system management EVC.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following is sample output from the **show ospfv3 interface** command:

```
>enable
#show ospfv3 interface
eth 0/1.106 is UP
    Link Local Address FE80::2A0:C8FF:FE1F:CC53, Interface ID 13
    Area 0, Process ID 61, VRF RED, Instance ID 0, Router ID 5.5.5.5
     Area 1, Process ID 24, VRF RED, Instance ID 1, Router ID 5.5.5.5
    Network type Broadcast, Cost: 1
    Transmit delay is 1, State BDR, Priority 1
    Designated Router (ID) 4.4.4.4, local address FE80::CA9C:1DFF:FED6:E0A0
    Backup Designated Router (ID) 5.5.5.5, local address FE80::2A0:C8FF:FE1F:CC53
    Timer intervals configured, Hello 10, Dead 40, Retransmit 5
        Hello due in 00:00:04
     Neighbor Count is 1, Adjacent neighbors count is 1
        Adjacent with neighbor 4.4.4.4 (Designated Router)
    Suppress hello for 0 neighbor(s)
eth 0/2.1 is UP
    Link Local Address FE80::2A0:C8FF:FE1F:CC54, Interface ID 14
     Area 1, Process ID 61, Instance ID 0, Router ID 5.5.5.5
    Network type Broadcast, Cost: 1
    Transmit delay is 1, State DR, Priority 1
    Designated Router (ID) 5.5.5.5, local address FE80::2A0:C8FF:FE1F:CC54
    Backup Designated Router (ID) 0.0.0.0, local address ::
    Timer intervals configured, Hello 10, Dead 40, Retransmit 5
        Hello due in 00:00:06
    Neighbor Count is 0, Adjacent neighbors count is 0
    Suppress hello for 0 neighbor(s)
```

show ospfv3 neighbor

Use the **show ospfv3 neighbor** command to display Open Shortest Path First version 3 (OSPFv3) information related to OSPFv3 neighbors. Variations of this command include:

show ospfv3 neighbor
show ospfv3 neighbor detail
show ospfv3 neighbor <*interface*>
show ospfv3 neighbor <*interface*> **detail**
show ospfv3 neighbor <*interface*> **hostname**
show ospfv3 neighbor <*interface*> **hostname detail**
show ospfv3 neighbor <*interface*> <*router id*>
show ospfv3 neighbor <*interface*> <*router id*> **detail**
show ospfv3 neighbor hostname
show ospfv3 neighbor hostname detail
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]**
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc] detail**
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc] hostname**
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc] hostname detail**
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*>
show ospfv3 neighbor [mef-ethernet <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*> **detail**
show ospfv3 neighbor <*router id*>
show ospfv3 neighbor <*router id*> **detail**
show ospfv3 <*process id*> **neighbor**
show ospfv3 <*process id*> **neighbor detail**
show ospfv3 <*process id*> **neighbor** <*interface*>
show ospfv3 <*process id*> **neighbor** <*interface*> **detail**
show ospfv3 <*process id*> **neighbor** <*interface*> **hostname**

show ospfv3 <*process id*> **neighbor** <*interface*> <*router id*>
show ospfv3 <*process id*> **neighbor** <*interface*> <*router id*> **detail**
show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] detail**
show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] hostname**
show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] hostname detail**
show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*>

show ospfv3 <*process id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*> **detail**
show ospfv3 <*process id*> **neighbor hostname**
show ospfv3 <*process id*> **neighbor hostname detail**
show ospfv3 <*process id*> **neighbor** <*router id*>
show ospfv3 <*process id*> **neighbor** <*router id*> **detail**
show ospfv3 <*process id*> <*area id*> **neighbor**
show ospfv3 <*process id*> <*area id*> **neighbor detail**
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*>
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*> **detail**
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*> **hostname**
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*> **hostname detail**
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*> <*router id*>
show ospfv3 <*process id*> <*area id*> **neighbor** <*interface*> <*router id*> **detail**
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]**
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] detail**
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] hostname**
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc] hostname detail**
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*>
show ospfv3 <*process id*> <*area id*> **neighbor [mef-ethernet** <*slot/port*> **| system-control-evc | system-management-evc]** <*router id*> **detail**
show ospfv3 <*process id*> <*area id*> **neighbor hostname**
show ospfv3 <*process id*> <*area id*> **neighbor hostname detail**
show ospfv3 <*process id*> <*area id*> **neighbor** <*router id*>
show ospfv3 <*process id*> <*area id*> **neighbor** <*router id*> **detail**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*process id*>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.
<*area id*>	Optional. Limits the output of this command to a single OSPFv3 area. Valid range is **0** to **4294967295**.

<interface>	Optional. Limits the output of this command to a single OSPFv3 interface. Specify interfaces in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id>*. For example, to specify a Point-to-Point Protocol (PPP) interface, enter **ppp 1**. Enter **show ospfv3 neighbor ?** for a list of available interfaces.
mef-ethernet *<slot/port>*	Optional. Limits the output of this command to the Metro Ethernet Forum (MEF) Ethernet interface.
system-control-evc	Optional. Limits the output of this command to the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Limits the output of this command to the system management EVC.
<router id>	Optional. Limits the output of this command to a single specified advertising router by router ID.
hostname	Optional. Limits the output of this command to a single specified router by router host name.
detail	Optional. Specifies that more detailed information is displayed in the command output.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Usage Examples

The following is sample output from the **show ospfv3 neighbor** command:

```
>enable
#show ospfv3 neighbor
OSPFv3 Router with ID (5.5.5.5) (Process ID 61, VRF RED)

Neighbor ID     Pri State           Dead Time  Intf-ID  Interface
4.4.4.4           1 FULL/DR         00:00:34      8     eth 0/1.106
```

show ospfv3 summary-prefix

Use the **show ospfv3 summary-prefix** command to display details about Open Shortest Path First version 3 (OSPFv3) redistributed routes that have been summarized using the command *summary-prefix <ipv6 address/prefix-length> on page 4166*. Variations of this command include:

show ospfv3 summary-prefix
show ospfv3 *<process id>* **summary-prefix**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<process id>	Optional. Limits the output of this command to a single OSPFv3 process. Valid range is **1** to **65535**.

Default Values

No default values are necessary for this command.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following is sample output from the **show ospfv3 summary-prefix** command for process **61**:

```
>enable
#show ospfv3 61 summary-prefix
OSPFv3 Summary Addresses, Process ID 61, VRF RED:
  2001:8:7::/48 Metric 11111, Type 1, advertise
```

show output-chkdsk

Use the **show output-chkdsk** command to display output from the CFLASH checkdisk that occurs at boot up. File allocation table (FAT) errors detected or repaired are shown from the last boot up using this command. If checkdisk passed without incident, the command displays the output **File is empty**. This command is only applicable to Adtran integrated communications products (ICPs).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 14.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show output-chkdsk** command where checkdisk passed:

```
>enable
#show output-chkdsk
File is empty.
```

The following is sample output from the **show output-chkdsk** command where errors were detected and repaired. An explanation of the errors found follows the output:

```
>enable
#show output-chkdsk
## 'SystemDefaultPrompts' The '.' entry has a non-zero size (repaired).
## 'SystemDefaultPrompts' The '..' entry points to cluster 2 (should be root directory - repaired).
## Cluster 583 chains to 435, but 583 is already used in another chain.
## Terminated subsequent instance of cross-linked chain starting at 205 at cluster 394.
## 'VoiceMail' The '.' first entry was not found.
## 'VoiceMail' Found 2 checksum mismatches (repaired).
## 'VoiceMail/Messages' Found 3 trailing entries (repaired).
## 'VoiceMail' Found 2 duplicate entries (repaired).
```

The following errors are minor and can be ignored.

'SystemDefaultPrompts' The '.' entry has a non-zero size (repaired).
'SystemDefaultPrompts' The '..' entry points to cluster 2 (should be root directory - repaired).

The following errors are more serious, but have been repaired. They indicate that the FAT has been corrupted. In some instances, major files may be lost (if they were corrupt or were contained within a corrupt directory).

Found 20 orphaned clusters (not free and not used - repaired).
Cluster 583 chains to 435, but 583 is already used in another chain.
Terminated subsequent instance of cross-linked chain starting at 205 at cluster 394.

The following error results in the removal of the entire directory:

'VoiceMail' The '.' first entry was not found.

The following errors are minor. They indicate that some corruption has occurred, specifically with the naming units of the files involved. In most cases, these can be repaired without data loss.

'VoiceMail' Found 2 checksum mismatches (repaired).
'VoiceMail' Found 15 invalid names (repaired).
'VoiceMail/Messages' Found 3 trailing entries (repaired).
'VoiceMail' Found 2 duplicate entries (repaired).

show output-errors

Use the **show output-errors** command to display the startup error log. If no errors are encountered during startup, the command displays the output **File is empty**.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example shows output from the **show output-errors** command:

```
>enable
#show output-errors
File is empty.
```

show output-startup

Use the **show output-startup** command to display startup configuration output line by line. This output can be copied into a text file and then used as a configuration editing tool.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show output-startup** command:

```
>enable
#show output-startup
!
#!
#hostname "UNIT_2"
UNIT_2#no enable password
UNIT_2#!
UNIT_2#ip subnet-zero
UNIT_2#ip classless
UNIT_2#ip routing
UNIT_2#!
UNIT_2#event-history on
UNIT_2#no logging forwarding
UNIT_2#logging forwarding priority-level info
UNIT_2#no logging email
--MORE--
```

show over-temperature protection

Use the **show over-temperature protection** command to display current status for the over temperature protection feature.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.6.0	Command was introduced.
Release R12.1.0	Command was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

The shutdown threshold is not user defined and cannot be changed on the unit. For more information about over temperature protection configuration, refer to the *Over-Temperature Protection Command Set on page 4446*.

This command is not available for vAOS instances.

Usage Examples

The following is sample output from the **show over-temperature protection** command:

```
>enable
#show over-temperature protection

    Over-Temperature Protection Status

    Admin State          : Enabled
    Warning Threshold    : 70C    158F
    Recovery Threshold   : 70C    158F
    Shutdown Threshold   : 75C    167F
```

show packet-capture

Use the **show packet-capture** command to display packet capturing statistics and verify the packet-capture configuration. Variations of this command include:

show packet-capture captures
show packet-capture captures memory-usage
show packet-capture captures memory-usage realtime
show packet-capture captures sip-calls
show packet-capture captures sip-calls realtime
show packet-capture captures realtime
show packet-capture interfaces
show packet-capture interfaces realtime
show packet-capture memory-usage
show packet-capture memory-usage captures
show packet-capture memory-usage captures realtime
show packet-capture memory-usage captures sip-calls
show packet-capture memory-usage captures sip-calls realtime
show packet-capture memory-usage interfaces
show packet-capture memory-usage interfaces realtime
show packet-capture memory-usage realtime
show packet-capture sip-calls
show packet-capture sip-calls realtime
show packet-capture
show packet-capture verbose realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

captures	Displays the active captures of every configured packet-capture.
interfaces	Displays the interfaces with attached packet-captures and any observed Netifs.
memory-usage	Displays packet capturing memory usage statistics. These statistics can be further limited by active captures, Session Initiation Protocol (SIP) calls, and interfaces.
sip-calls	Displays the active calls of every SIP packet-capture.
realtime	Optional. Displays the command output in realtime.
verbose	Optional. Displays detailed packet-capture information.

Default Values

No default values are necessary for this command.

Command History

Release R10.1.0	Command was introduced.

Usage Examples

The following example displays the active captures of every configured packet-capture:

>**enable**
#show packet-capture captures
Active Captures:

CapturID	Packet-capture	State	Size	Start
331	1CAPTURE	open	24	2011.03.15 23:50:10
332	2CAPTURE	exporting	24	2011.03.15 23:48:27

Export Jobs (ongoing or recently completed):

CaptID	Sent	Destination	Status
332	151K	10.17.127.251:69	In progress

show port-auth

Use the **show port-auth** command to view port authentication information. Variations of this command include:

show port-auth
show port-auth detailed
show port-auth detailed interface <*interface*>
show port-auth interface <*interface*>
show port-auth statistics
show port-auth statistics interface <*interface*>
show port-auth summary
show port-auth summary interface <*interface*>
show port-auth supplicant
show port-auth supplicant interface <*interface*>
show port-auth supplicant summary
show port-auth supplicant summary interface <*interface*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detailed	Optional. Displays detailed port authentication information.
statistics	Optional. Displays port authentication statistics.
summary	Optional. Displays a summary of port authentication settings.
supplicant	Optional. Displays port authentication supplicant information.
interface <*interface*>	Optional. Displays port authentication information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show port-auth interface ?** for a list of valid interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**, and the **supplicant** keyword.
Release A5.01	Command was expanded to include the Gigabit Ethernet and gigabit switchport interfaces.
Release R.11.5.0	Command was expanded to include media access control (MAC) authentication bypass information.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following example displays the port authentication information:

```
>enable
#show port-auth
Global Port-Authentication Parameters:
   re-authentication enabled: False
   reauth-period: 3600
   quiet-period: 60
   tx-period: 30
   supp-timeout: 30
   server-timeout: 30
   reauth-max: 2
Port-Authentication Port Summary:
      * MAB - MAC Authentication Bypass
   Interface    Status       Type                Mode    Authorized
 ----------------------------------------------------------------------------------------------
   eth 0/1      disabled     port-based          n/a     n/a
   eth 0/2      disabled     port-based:MAB      auto    not authorized
   eth 0/3      disabled     port-based          n/a     n/a
   eth 0/4      disabled     port-based          n/a     n/a
   eth 0/5      disabled     port-based          n/a     n/a
   eth 0/6      disabled     port-based          n/a     n/a
   eth 0/7      disabled     port-based          n/a     n/a
   eth 0/8      disabled     port-based          n/a     n/a
   eth 0/9      disabled     port-based          n/a     n/a
   eth 0/10     disabled     port-based          n/a     n/a
   eth 0/11     disabled     port-based          n/a     n/a
   eth 0/12     disabled     port-based          n/a     n/a
   eth 0/13     disabled     port-based          n/a     n/a
   eth 0/14     disabled     port-based          n/a     n/a
   eth 0/15     disabled     port-based          n/a     n/a
   eth 0/16     disabled     port-based          n/a     n/a
   eth 0/17     disabled     port-based          n/a     n/a
   eth 0/18     disabled     port-based          n/a     n/a
```

```
  eth 0/19     disabled     port-based              n/a      n/a
Port Authentication Port Details:
  Port-Authentication is disabled on eth 0/1
  Port-Authentication is enabled on eth 0/2
    Status                    not authorized
    Auth Mode                 port-based
    Port-Control              auto
    Multiple Hosts Allowed    disabled
    MAC Auth Bypass           enabled
    Supplicant MAC            n/a
    Current Identifier        0
```

show port-security

Use the **show port-security** command to display port security information. Variations of this command include:

show port-security
show port-security address
show port-security interface *<interface>*
show port-security interface *<interface>* **address**
show port-security port-expiration
show port-security port-expiration detailed

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

address	Optional. Displays a list of secure medium access control (MAC) addresses for all interfaces currently configured for port security.
interface *<interface>*	Optional. Filters the output to include only information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show port-security interface ?** for a complete list of valid interfaces.
port-expiration	Optional. Displays the ports currently participating in port expiration and the amount of time left until the port is shut down.
detailed	Optional. Displays information for all interfaces, even if not configured for port expiration.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 18.3	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following displays all secure MAC addresses related to the Ethernet 0/1 interface:

```
>enable
#show port-security interface eth 0/1 address
VLAN   Mac Address         Type of Entry     Interface   Remaining Time
-------------------------------------------------------------------------------------------------------------
1      00:a0:c8:0a:c6:4a   Dynamic-Secure    eth 0/1     --
1      00:a0:c8:0a:c6:4b   Dynamic-Secure    eth 0/1     --
-------------------------------------------------------------------------------------------------------------
Dynamic Address Count: 2
Static Address Count: 0
Sticky Address Count: 0
Total Address Count: 2
```

show power inline

Use the **show power inline** command to display power information (in watts) for devices connected to Power over Ethernet (PoE) interfaces. The command also displays the PoE interfaces that can be powered, whether the interfaces are powered or not, and the IEEE class for the device(s) connected to the PoE interfaces. Variations of this command include:

show power inline
show power inline <*slot/port*>
show power inline <*slot/port*> **realtime**
show power inline vcid <*vcid*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*slot/port*>	Optional. Specifies the slot/port of a PoE interface. If specified, the command only displays information related to that interface.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.
vcid <*vcid*>	Optional. Specifies the virtual chassis ID of an ActivChassis member. If specified, the command only displays information related to that member. Valid VCID range is **1** to **8**. VCID values **1** and **2** are given to the ActivChassis master and backup devices, respectively.

Default Values

No default values are necessary for this command.

Command History

Release 9.1	Command was introduced.
Release 11.1	The **realtime** display parameter was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R10.7.0	Command was expanded to include the **vcid** parameter.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays power information for all PoE interfaces:

```
>enable
#show power inline
Interface       Admin       Oper       Power (watts)       Class
eth 0/1         auto        off        n/a                 n/a
eth 0/2         auto        off        n/a                 n/a
--MORE--
```

show power-supply

Use the **show power-supply** command to display the power supply status.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays the power supply status:

```
>enable
#show power-supply
Power supply 1 is OK.
Power supply 2 is not present.
```

show pppoe

Use the **show pppoe** command to display all Point-to-Point Protocol over Ethernet (PPPoE) settings and associated parameters.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example enters the Enable mode and uses the **show** command to display PPPoE information:

```
>enable
#show pppoe
ppp 1
 Outgoing Interface: eth 0/1
 Outgoing Interface MAC Address: 00:A0:C8:00:85:20
 Access-Concentrator Name Requested: FIRST VALID
 Access-Concentrator Name Received: 13021109813703-LRVLGAOS90W_IFITL
 Access-Concentrator MAC Address: 00:10:67:00:1D:B8
 Session Id: 64508
 Service Name Requested: ANY
 Service Name Available:
 PPPoE Client State: Bound (3)
 Redial retries: unlimited
 Redial delay: 10 seconds
Backup enabled all day on the following days:
    Sunday Monday Tuesday Wednesday Thursday Friday Saturday
```

show pppoe system-control-evc

Use the **show pppoe system-control-evc** command to display the Point-to-Point Protocol over Ethernet (PPPoE) settings for the system control Ethernet virtual connection (EVC).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No defaults are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display the PPPoE information for the system control EVC:

```
>enable
#show pppoe system-control-evc
```

show policer

Use the **show policer** command to display Ethernet virtual connection (EVC) traffic policer configuration and state information. Variations of this command include:

show policer

show policer *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Displays information about the connected EVC policer profile. If no name is specified, information for all policers is displayed.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display information for all configured EVC policers:

```
>enable
#show policer
Policer “policer1”
    Admin State          : Disabled
    Policer Status       : Disabled
    Configured CIR       : 0 kbps
    Configured EIR       : 600000 kbps
    Configured CBS       : 3125 bytes
    Configured EBS       : 12500 bytes
     Mode                : Not applied
```

show privilege

Use the **show privilege** command to display the current user's privilege level.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example displays the user's current privilege level as **1**:

```
>enable
#show privilege
Current privilege level is 1
```

show probe

Use the **show probe** command to display probe configuration and statistics. Refer to *Network Monitor Probe Command Set on page 4062* for information on configuring probe objects. Variations of this command include the following:

show probe
show probe <*name*>
show probe <*name*> **realtime**
show probe responder icmp-timestamp
show probe responder icmp-timestamp realtime
show probe responder twamp
show probe responder twamp realtime
show probe responder udp-echo
show probe responder udp-echo realtime
show probe <*name*> **statistics**
show probe <*name*> **statistics history**
show probe statistics
show probe statistics history

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*name*>	Optional. Displays configuration and statistics for a specific probe.
responder	Displays the specified probe responder statistics.
icmp-timestamp	Optional. Displays the Internet Control Message Protocol (ICMP) timestamp probe responder statistics.
twamp	Optional. Displays the Two-Way Active Measurement Protocol (TWAMP) probe responder statistics.
udp-echo	Optional. Displays the User Datagram Protocol (UDP) echo probe responder statistics.
statistics	Optional. Displays measured probe statistics.
history	Optional. Displays the history of all measured probe statistics.

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.2	Command was expanded to include the probe responder options.
Release R13.5.0	Command output of **show udp echo** command was updated to include visibility of UDP echo probe responder hardware fast forwarding engine (FFE) support.

Functional Notes

A probe must be created first using the **probe** command. Issuing the shutdown command at the **probe** configuration prompt will disable a probe, causing it to cease traffic generation. While a probe is shutdown, it will not fail.

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Output from the **show probe responder udp-echo** command can vary depending on whether the hardware FFE feature is enabled or disabled on the AOS device. When hardware FFE is enabled, the **Rcvd** and **Sent** columns of the command output appear as **N/A**, and the **FFE Hits** and **Drops** columns of the output display current packet FFE and drop information. When hardware FFE is disabled, the command output displays current received (**Rcvd**) and sent (**Sent**) packet information and displays **N/A** for the **FFE Hits** and **Drops** columns.

Usage Examples

The following is sample output of the **show probe probe_A** command:

```
>enable
#show probe probe_A
Current State: PASS    Admin. Status: DOWN
    Type: ICMP Echo Period: 30 sec Timeout: 500 msec
    Hostname: www.adtran.com
    Tracked by: track_1
    Tests Run: 121 Failed: 0
    Time in current state: 25 days 2 hours, 34 minutes, 32 seconds
```

The following is sample output of the **show probe responder twamp** command:

```
>enable
#show probe responder twamp
0----------1----------2----------3----------4----------5----------6----------7----------8
12345678901234567890123456789012345678901234567890123456789012345678901234567890
TWAMP-Test: 360 rcvd, 360 sent
TWAMP-Control: 20 sessions opened, 18 sessions closed,
        3 sessions rejected, 2 sessions active
```

The following is sample output of the **show probe responder icmp-timestamp** command:

```
>enable
#show probe responder icmp-timestamp
0----------1----------2----------3----------4----------5----------6----------7----------8
12345678901234567890123456789012345678901234567890123456789012345678901234567890
ICMP Timestamp: 125 rcvd, 125 sent
```

The following is sample output of a TWAMP type probe named **Houston**:

```
>enable
#show probe Houston
0----------1----------2----------3----------4----------5----------6----------7----------8
12345678901234567890123456789012345678901234567890123456789012345678901234567890
Probe Houston:
 Current State: PASS Admin. Status: UP
 Type: TWAMP Period: 60 Timeout: 1500
 Source: 192.168.1.255:17001 Destination: 10.10.20.254:17000
 Data Size: 14 Num-packets 100 DSCP: 0
 Data pad: Zero
 Send-schedule: 20 msec Type: periodic
 Authentication Mode: open      Key: not set
 Tracked by: Nothing
 Tests Run: 194 Failed: 1
 Tolerance: not set
 Time in current state: 1 days, 2 hours, 50 minutes, 7 seconds
 Packet Loss          fail      pass
   Round Trip         1000      1000
```

The following is sample output of the **show probe responder udp-echo** command:

```
>enable
#show probe responder udp-echo
     Admin. Status: UP
     Rcvd     Sent     FFE Hits     Drops
     41       41       N/A          N/A
     N/A      N/A      19
```

show processes

Use the **show processes** command to display process statistic information. Variations of this command include:

show processes cpu
show processes cpu history
show processes cpu realtime
show processes history
show processes queue
show processes stack

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

cpu	Displays information about current active processes.
cpu history	Displays historical CPU utilization in graph form over the previous 1 minute, 1 hour, and 72 hour periods.
realtime	Displays full-screen CPU output in real time. Refer to the *Functional Notes* below for more information.
history	Displays process switch history.
queue	Displays process queue utilization.
stack	Displays the process stack usage.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 10.1	New option was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.5	Command was expanded to include the **stack** parameter.

Release R11.3.0	Command was expanded to include the **cpu history** parameter.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show processes cpu** command:

```
>enable
#show processes cpu
System load: 1sec:3.30%  1min:3.51%  5min:3.51%  Min: 0.00%  Max: 100.00%
Context switch load: 0.12%
```

Task Id	Task Name	PRI	STA	Invoked (count)	Exec Time (µsec)	Runtime (µsec)	Load %% (1sec)
1	Idle	0	W	116153	975	966830	96.68

show qos

Use the **show qos** command to display information regarding quality of service (QoS) and 802.1p class of service (CoS) settings. Variations of this command include:

show qos cos-map
show qos dscp-cos
show qos interface <*interface*>
show qos queuing

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

cos-map	Displays the CoS priority-to-queue map. The map outlines which CoS priority is associated with which queue.
dscp-cos	Displays the differentiated services code point (DSCP) to CoS map settings.
interface <*interface*>	Displays the configured values for default CoS and trust settings on a specific interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show qos interface ?** for a complete list of valid interfaces.
queuing	Displays the type of queuing being used. If weighted round robin (WRR) queuing is enabled, the command also displays the weight of each queue.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 7.1	Command was expanded to include the **dscp-cos** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show qos cos-map** command for a NetVanta switch product:

```
>enable
#show qos cos-map
CoS Priority:    0   1   2   3   4   5   6   7
Priority Queue:  1   1   2   2   3   3   4   4
```

The following is sample output from the **show qos cos-map** command for a carrier Ethernet product:

```
>enable
#show qos cos-map
VLAN Priority:   0   1   2   3   4   5   6   7
Queue:           1   0   2   3   4   5   6   7
```

The following is sample output from the **show qos interface** command for Ethernet 0/8 interface:

```
>enable
#show qos interface ethernet 0/8
 Ethernet 0/8
 trust state: trusted
 default CoS: 0
```

The following is sample output from the **show qos queuing** command with WRR queuing enabled:

```
>enable
#show qos queuing
Queue-type: wrr
Expedite queue: disabled
wrr weights:
 qid - weight
 1 - 12
 2 - 45
 3 - 55
 4 - 65
```

show qos map

Use the **show qos map** command to display information about the quality of service (QoS) map. This information differs based on how a particular map entry is defined. Variations of this command include the following:

show qos map
show qos map <*name*>
show qos map <*name*> <*number*>
show qos map interface <*interface*>
show qos map interface <*interface*> **extended**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*name*>	Optional. Specifies the name of a defined QoS map.
<*number*>	Optional. Specifies one of the map's defined sequence numbers.
interface <*interface*>	Optional. Displays the QoS map information for a specific interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show qos map interface ?** command for a complete list of interfaces.
extended	Optional. Includes the broadcast, multicast, and unicast counts in the display output.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) interface.
Release 11.1	Demand interface was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface.
Release R11.1.0	Command was expanded to include the Ethernet in the first mile (EFM) group, system control Ethernet virtual connection (EVC) and the system management EVC.
Release R11.4.0	Output for **show qos map interface** command was changed to include packet match statistics.
Release R11.5.0	Command was expanded to include the **extended** parameter.
Release R11.9.0	Command was expanded to include the tunnel interface.
Release R13.11.0	Output for the **show qos map interface** command for Gigabit Ethernet subinterfaces was changed to include Layer 3 ingress and egress bytes for both the UNI and NNI on a per-subinterface per-queue basis. Ingress and egress bytes are displayed in the **Ingress Aggregate Bytes** and **Egress Aggregate Bytes** output lines of the command output.

Usage Examples

The following example shows all QoS maps and all entries in those maps:

```
>enable
#show qos map
qos map priority
  map entry 10
    match IP packets with a precedence value of 6
    priority bandwidth: 400 (kilobits/sec) burst: default
  map entry 20
    match ACL icmp
  map entry 30
    match RTP packets on even destination ports between 16000 and 17000
  map entry 50
    match ACL tcp
  map entry 60
  match IP packets with a dscp value of 2
  set dscp value to 6
  map entry 70
  match NetBEUI frames being bridged by the router
  priority bandwidth: 150 (kilobits/sec) burst: default
  qos map tcp_map
  map entry 10
    match ACL tcp
    priority bandwidth: 10 (kilobits/sec) burst: default
    set precedence value to 5
  map entry 20
    match IP packets with a precedence value of 3
    priority bandwidth: 50 (kilobits/sec) burst: default
```

The following example shows the QoS map named **priority** and all entries in that map:

```
>enable
#show qos map priority
  qos map priority
  map entry 10
   match IP packets with a precedence value of 6
   priority bandwidth: 400 (kilobits/sec) burst: default
  map entry 20
   match ACL icmp
  map entry 30
   match RTP packets on even destination ports between 16000 and 17000
  map entry 50
   match ACL tcp
  map entry 60
   match IP packets with a dscp value of 2
   set dscp value to 6
  map entry 70
   match NetBEUI frames being bridged by the router
   priority bandwidth: 150 (kilobits/sec) burst: default
```

The following example shows only QoS map named **priority** with the sequence number **10**:

```
>enable
#show qos map priority 10
  qos map priority
  map entry 10
   match IP packets with a precedence value of 6
   priority bandwidth: 400 (kilobits/sec) burst: default
```

The following examples show QoS map interface statistics associated with the applied map for the Frame Relay 1 interface:

```
>enable
#show qos map interface frame-relay 1
fr 1
qos-policy out: priority
  map entry 10
   match IP packets with a precedence value of 6
   budget 145/10000 bytes (current/max)
   priority bandwidth: 400 (kilobits/sec)
   packets matched on interface: 27289
   packets dropped: 0

  map entry 20
   match IP packets with a DSCP value of af41
   class bandwidth: 40 (% of remaining)
```

```
    conversation: 235
    packets matched: 23457
    packets dropped: 0

>enable
#show qos map int gig 0/2.1
 giga-eth 0/2.1
  qos-policy out: MAP_OUT
   map entry 11
     match ip dscp af11
     set egress-queue value to 0
     packets matched: 7, bytes matched: 1022
     5 minute offered rate 0 bits/sec
   map entry 12
     match ip dscp af12
     set egress-queue value to 0
     packets matched: 0, bytes matched: 0
     5 minute offered rate 0 bits/sec
   map entry 13
     match ip dscp af13
     set egress-queue value to 0
     packets matched: 5, bytes matched: 730
     5 minute offered rate 16 bits/sec
   map entry default
     packets matched: 26, bytes matched: 4812
     5 minute offered rate 72 bits/sec

 giga-eth 0/2.1
  qos-policy in: MAP_IN (enabled)
   map entry 11
     match ip dscp af11
     set DSCP value to 0
     packets matched: 7, bytes matched: 896
     5 minute offered rate 0 bits/sec, drop rate 0 bits/sec
   map entry 12
     match ip dscp af12
     set DSCP value to 0
     packets matched: 5, bytes matched: 640
     5 minute offered rate 16 bits/sec
   map entry 13
     match ip dscp af13
     set DSCP value to 0
     packets matched: 5, bytes matched: 640
     5 minute offered rate 16 bits/sec, drop rate 0 bits/sec
```

```
  map entry default
    packets matched: 0, bytes matched: 0
    5 minute offered rate 0 bits/sec
```

show queue *<interface>*

Use the **show queue** command to display conversation information associated with an interface queue. This command shows summary and per-conversation information. The per-conversation details are only displayed if the interface has sufficient traffic to be congested and packets are being held in the interface queue. Variations of this command include:

show queue *<interface>*
show queue *<interface>* **child**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Displays the queueing information for the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type the **show queue ?** command to display a list of valid interfaces.
child	Optional. Displays the subqueue statistics.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) interface.
Release 11.1	Demand interface was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.4	Command was expanded to include the **child** keyword.
Release 17.5	Command was expanded to include the asynchronous transfer mode (ATM) and Frame Relay interfaces.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface.

Usage Examples

The following is sample output from the **show queue** command:

```
>enable
#show queue ethernet 0/2
 Queueing method: weighted fair
 Output queue: 4/222/540/64/176 (size/highest/max total/threshold/drops)
    Conversations 0/4/256 (active/max active/max total)
    Available Bandwidth 15000 kilobits/sec

   (depth/weight/matches/discards) 4/32768/32456/0
   Conversation 178, linktype: ip, length: 936
   source: 10.22.13.34, destination: 10.22.2.3, id: 0xddc6, ttl: 127,
   TOS: 0 prot: 6 (tcp), source port 1086, destination port 20
```

show queue interfaces

Use the **show queue interfaces** command to display the contents and queuing method for Layer 3 interface queues. Variations of this command include:

show queue interfaces efm-group
show queue interfaces efm-group <*slot/group*>
show queue interfaces efm-group <*slot/group*> **counters**
show queue interfaces efm-group <*slot/group*> **counters** <*queue*>
show queue interfaces efm-group <*slot/group*> **performance-statistics 15-minute**
show queue interfaces efm-group <*slot/group*> **performance-statistics 15-minute** <*value*>
show queue interfaces efm-group <*slot/group*> **performance-statistics 24-hour**
show queue interfaces efm-group <*slot/group*> **performance-statistics 24-hour** <*value*>
show queue interfaces efm-group <*slot/group*> <*queue*>
show queue interfaces efm-group <*slot/group*> <*queue*> **performance-statistics 15-minute**
show queue interfaces efm-group <*slot/group*> <*queue*> **performance-statistics 15-minute** <*value*>
show queue interfaces efm-group <*slot/group*> <*queue*> **performance-statistics 24-hour**
show queue interfaces efm-group <*slot/group*> <*queue*> **performance-statistics 24-hour** <*value*>
show queue interfaces gigabit-ethernet
show queue interfaces gigabit-ethernet <*slot/port*>
show queue interfaces gigabit-ethernet <*slot/port*> **counters**
show queue interfaces gigabit-ethernet <*slot/port*> **counters** <*queue*>
show queue interfaces gigabit-ethernet <*slot/port*> **counters nni**
show queue interfaces gigabit-ethernet <*slot/port*> **performance-statistics 15-minute**
show queue interfaces gigabit-ethernet <*slot/port*> **performance-statistics 15-minute** <*value*>
show queue interfaces gigabit-ethernet <*slot/port*> **performance-statistics 24-hour**
show queue interfaces gigabit-ethernet <*slot/port*> **performance-statistics 24-hour** <*value*>
show queue interfaces gigabit-ethernet <*slot/port*> <*queue*>
show queue interfaces gigabit-ethernet <*slot/port*> <*queue*> **performance-statistics 15-minute**
show queue interfaces gigabit-ethernet <*slot/port*> <*queue*> **performance-statistics 15-minute** <*value*>
show queue interfaces gigabit-ethernet <*slot/port*> <*queue*> **performance-statistics 24-hour**
show queue interfaces gigabit-ethernet <*slot/port*> <*queue*> **performance-statistics 24-hour** <*value*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

efm-group <*slot/group*>	Displays queue information for a specific EFM group. Valid EFM group range is **1** to **1024**. If the slot and group are not specified, queue information for all EFM groups is displayed.

gigabit-ethernet <*slot/port*>	Displays queue information for the Gigabit Ethernet interface. If the slot and port are not specified, queue information for all Gigabit Ethernet interfaces is displayed.
counters	Optional. Displays Metro Ethernet Forum (MEF) user network interface (UNI) counters for the specified interface. If <*queue*> is specified, displays only the counters for the specified queue on the specified interface.
<*queue*>	Optional. Limits the output of this command to a single queue associated with the interface. Valid range is **0** to **7**.
nni	Optional. Displays Metro Ethernet Forum (MEF) network-to-network interface (NNI) counters for the specified interface.
performance-statistics	Optional. Displays aggregate performance statistics.
15-minute	Optional. Displays the statistics for a 15-minute period in the last 24 hours.
24-hour	Optional. Displays the statistics for a 24-hour period in the last 7 days.
<*value*>	Optional. Specifies which 15-minute period in the last 24 hours or which 24-hour period in the last 7 days is displayed. Range for 15-minute periods is **1** to **96**; range for 24-hour periods is **1** to **7**.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.
Release R11.5.0	Command was expanded to include **counters** and **performance-statistics** parameters.
Release R13.11.0	Command was expanded to include the **nni** parameter. In addition, command output was changed to include ingress and egress Layer 2 bytes.

Usage Examples

The following example displays queue information for the Gigabit Ethernet interface 1/1:

```
>enable
#show queue interfaces gigabit-ethernet 1/1
Queuing method: fifo
Output queue: 0/256/0 (size/max total/drops)
```

show queue priority max-configured

Use the **show queue priority max-configured** command to display the configured maximum number of priority queues for quality of service (QoS) maps. Priority queues are configured using the command *priority queue-limit <value> on page 4485*.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.3.0	Command was introduced.

Usage Examples

The following example displays the QoS map priority queue limit:

```
>enable
#show queue priority max-configured
Total maximum configured priority queue-limit: 256
```

show queuing

Use the **show queuing** command to display information associated with configured queuing methods. Variations of this command include:

show queuing
show queuing fair

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

fair	Optional. Displays only information on the weighted fair queuing (WFQ) configuration.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show queuing** command:

```
>enable
#show queuing
  Interface        Discard threshold    Conversation subqueues
  fr 1             64                   256
  fr 2             64                   256
  ppp 1            64                   256
```

show radius statistics

Use the **show radius statistics** command to display various statistics from the remote authentication dial-in user service (RADIUS) subsystem. These statistics include number of packets sent, number of invalid responses, number of timeouts, average packet delay, and maximum packet delay. Statistics are shown for both authentication and accounting packets.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show radius statistics** command:

```
>enable
#show radius statistics
                              Auth.       Acct.
Number of packets sent:       3           0
Number of invalid responses:  0           0
Number of timeouts:           0           0
Average delay:                2 ms        0 ms
Maximum delay:                3 ms        0 ms
```

show ramdisk

Use the **show ramdisk** command to display a list of all files currently stored in volatile random access memory (RAM) disk memory or details about a specific file stored in RAM disk memory. Variations of this command include:

show ramdisk
show ramdisk *<filename>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

> *Not all units are capable of using a RAM disk file system. Use the **show ?** command to display a list of valid commands at the enable prompt.*

Syntax Description

<filename>	Optional. Displays details for a specified file located in RAM disk file system. Enter a wildcard (such as ***.biz**) to display the details for all files matching the entered pattern.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced for AOS units limited to only 16 Megabytes of flash memory.

Usage Examples

The following is sample **show ramdisk** output displaying the contents of the RAM disk, space occupied by each file, the total RAM disk space allocated, available space, and used space:

```
>enable
#show ramdisk
10005125 NV3130A-17-07-00-26-AE.biz
10007923 bytes used, 7429514 available, 17437437 total
```

show route-map

Use the **show route-map** command to display any route maps that have been configured in the router. This command displays any match and set clauses associated with the route map, as well as the number of incoming routes that have matched each route map. Route maps can be used for Border Gateway Protocol (BGP) and PBR. Variations of this command include:

show route-map
show route-map *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Displays only the route map matching the specified name.

Default Values

By default, this command displays all defined route maps.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

In the example below, all route maps in the router are displayed.

```
>enable
#show route-map
route-map RouteMap1, permit, sequence 10
 Match clauses:
   community (community-list filter): CommList1
 Set clauses:
   local-preference 250
 BGP Filtering matches: 75 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap1, permit, sequence 20
 Match clauses:
   community (community-list filter): CommList2
```

```
 Set clauses:
   local-preference 350
 BGP Filtering matches: 87 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap2, permit, sequence 10
 Match clauses:
   ip address (access-lists): Acl1
 Set clauses:
   metric 100
 BGP Filtering matches: 10 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap2, permit, sequence 20
 Match clauses:
   ip address (access-lists): Acl2
 Set clauses:
   metric 200
 BGP Filtering matches: 12 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap3, permit, sequence 10
 Match clauses:
   length 150 200
 Set clauses:
   ip next-hop: 10.10.11.254
 BGP Filtering matches: 0 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap3, permit, sequence 20
 Match clauses:
   ip address (access-lists): Acl3
 Set clauses:
   ip next-hop: 10.10.11.14
 BGP Filtering matches: 0 routes
 Policy routing matches: 144 packets 15190 bytes
```

In the example below, only **RouteMap2** is displayed.

```
>enable
#show route-map RouteMap2
route-map RouteMap2, permit, sequence 10
 Match clauses:
   ip address (access-lists): Acl1
 Set clauses:
   metric 100
 BGP Filtering matches: 10 routes
 Policy routing matches: 0 packets 0 bytes
route-map RouteMap2, permit, sequence 20
--MORE--
```

show rps

Use the **show rps** command to show information related to the redundant power supply (RPS) power state. The output of this command indicates if an RPS is connected, if it is delivering power, the available power, and whether the RPS has failed.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.8.0	Command was introduced.

Usage Examples

The following is sample output from this command:

```
>enable
#show rps
VCID 1 RPS is connected
VCID 1 RPS is not delivering power
VCID 2 RPS is connected
VCID 2 RPS is not delivering power
```

show rtp media sessions

Use the **show rtp media sessions** command to display all of the anchored Realtime Transport Protocol (RTP) flow associations and the number of relayed packets per association currently active in an anchored RTP flow. In addition, the time to live (TTL) and the session type (digital signal processor (DSP), media anchored, or transcoded) for the association is displayed.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.4.0	Command was introduced and replaced the **show ip rtp media-anchoring sessions** command.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following example displays a summary of all gathered media statistics:

```
>enable
#show rtp media sessions
  CallID  Anchored Address      Remote Address       TTL   Pkts     Ovrd  Type   Sess
  ------------------------------------------------------------------------------------------------------------------------
   7      10.10.10.1:40008      10.10.10.2:2230      45    108062   No    Audio  Xcode
   7      10.17.250.12:40010    10.17.250.14:10262   45    108063   No    Audio  Xcode
   7      10.10.10.1:40009      10.10.10.2:2231      44    432      No    Audio  Xcode
   7      10.17.250.12:40011    10.17.250.14:10263   44    432      No    Audio  Xcode
```

show rtp quality-monitoring

Use the **show rtp quality-monitoring** command to display a summary of all voice quality monitoring (VQM) statistics gathered from monitoring inbound Realtime Transport Protocol (RTP) streams across the network.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.1	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

The following example displays a summary of all gathered VQM statistics:

#show rtp quality-monitoring

```
Voice Quality Monitoring is ENABLED
Jitter Buffer: adaptive 10/50/100 ms (min/nominal/max)

Quality     Active Streams      Call History    All Streams     MOS range
----------  ------------------  --------------  --------------  ----------------
Excellent   60                  50              13462           4.40 - 4.00
Good        20                  37              3456            3.99 - 3.60
Fair        3                   1               45              3.59 - 2.60
Poor        1                   7               7               2.59 - 0.00
----------  ------------------  --------------  --------------  ----------------
Totals:     84                  95              16970

(Note: Statistics for All Streams are updated at call completion and do not include currently active
streams. Call history statistics are available for up to 100 streams.)

History thresholds:
MOS (LQ/CQ/PQ): 3.0/3.0/3.0
```

Loss: 20 pkts
Out-of-order packets: 300 pkts
Jitter: 300 ms

Notification thresholds:

Metric	Info	Notice	Warning	Error
PQ MOS	4.4	4.0	3.6	2.6
LQ MOS	4.4	4.0	3.6	2.6
Loss	N/A	25	50	100 pkts
Out-of-order	N/A	N/A	50	100 pkts
Jitter	N/A	20	100	300 ms

Traps: ENABLED at Notice

Traps sent: 14

show rtp quality-monitoring active-calls

Use the **show rtp quality-monitoring active-calls** command to display the voice quality monitoring (VQM) statistics gathered from monitoring active calls on inbound Realtime Transport Protocol (RTP) streams across the network. These statistics can be sorted by mean opinion score (MOS), jitter, or lost or out-of-order packets. Variations of this command include:

show rtp quality-monitoring active-calls
show rtp quality-monitoring active-calls call-id <*string*>
show rtp quality-monitoring active-calls degradation
show rtp quality-monitoring active-calls detail
show rtp quality-monitoring active-calls from-uri <*string*>
show rtp quality-monitoring active-calls sort-by jitter
show rtp quality-monitoring active-calls sort-by loss
show rtp quality-monitoring active-calls sort-by lq-mos
show rtp quality-monitoring active-calls sort-by out-of-order
show rtp quality-monitoring active-calls sort-by pq-mos
show rtp quality-monitoring active-calls source-uri <*string*>
show rtp quality-monitoring active-calls to-uri <*string*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

call-id <*string*>	Optional. Displays active call statistics based on a substring of the Call-ID.
degradation	Optional. Displays possible sources of voice quality degradation for active calls.
detail	Optional. Displays details of all available active call statistics.
from-uri <*string*>	Optional. Displays active call statistics based on a substring of the From URI.
sort-by jitter	Optional. Displays active call statistics with the highest amount of jitter first.
sort-by loss	Optional. Displays active call statistics with the highest number of lost packets first.
sort-by lq-mos	Optional. Displays active call statistics with the lowest listening quality (LQ) MOS first.
sort-by out-of-order	Optional. Displays active call statistics with the highest number of out-of-order packets first.
sort-by pq-mos	Optional. Displays active call statistics with the lowest perceived quality (PQ) MOS first.

source-uri <*string*>	Optional. Displays active call statistics based on a substring of the URI/extension from which the RTP stream is sourced.
to-uri <*string*>	Optional. Displays active call statistics based on a substring of the To uniform resource identifier (URI) or extension to which this RTP stream is destined.

Default Values

By default, only the most commonly used statistics are shown.

Functional Notes

These statistics will not be available if VQM is disabled.

Command History

Release 17.1	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

In the following example, VQM active call statistics are sorted by lost packets:

```
#show rtp quality-monitoring active-calls sort-by loss
    Displaying 30 estimated stream statistics from 15 completed calls

    RTP stream: 3.3.3.3 : 50000, ppp 1 -> 1.1.1.1 : 3000, vlan 1
    To: 5551234@voip.com
        Call-start (duration): 11 Apr 2010 20:58:39 (93 s)
        MOS LQ: 3.800
        MOS PQ: 3.800
        Loss: 413 pkts
        Out-of-order: 30 pkts
        Jitter (max): 20 ms
        CODEC: g711

    RTP stream: 1.1.1.1 : 3000, vlan 1 -> 3.3.3.3: 50000, ppp 1
    To: 5551234@voip.com
    From: 5551235@voip.com
        Call-start (duration): 11 Apr 2010 20:58:39 (93 s)
        MOS LQ: 3.800
        MOS PQ: 3.800
        Loss: 0 pkts
        Out-of-order: 0 pkts
        Jitter (max): 1 ms
        CODEC: g711
--MORE--
```

show rtp quality-monitoring call-history

Use the **show rtp quality-monitoring call-history** command to display the voice quality monitoring (VQM) statistics gathered from previously monitored calls on inbound Realtime Transport Protocol (RTP) streams. These calls are stored in the VQM call history. These statistics can be sorted by mean opinion score (MOS), jitter, or lost or out-of-order packets. Variations of this command include:

show rtp quality-monitoring call-history
show rtp quality-monitoring call-history call-id <*string*>
show rtp quality-monitoring call-history degradation
show rtp quality-monitoring call-history detail
show rtp quality-monitoring call-history from-uri <*string*>
show rtp quality-monitoring call-history sort-by jitter
show rtp quality-monitoring call-history sort-by loss
show rtp quality-monitoring call-history sort-by lq-mos
show rtp quality-monitoring call-history sort-by out-of-order
show rtp quality-monitoring call-history sort-by pq-mos
show rtp quality-monitoring call-history source-uri <*string*>
show rtp quality-monitoring call-history to-uri <*string*>
show rtp quality-monitoring call-history degradation
show rtp quality-monitoring call-history detail

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

call-id <*string*>	Optional. Displays past call statistics based on a substring of the Call-ID.
degradation	Optional. Displays possible sources of voice quality degradation for past calls.
detail	Optional. Displays details of all available past call statistics.
from-uri <*string*>	Optional. Displays past call statistics based on a substring of the From URI.
sort-by jitter	Optional. Displays past call statistics with the highest amount of jitter first.
sort-by loss	Optional. Displays past call statistics with the highest number of lost packets first.
sort-by lq-mos	Optional. Displays past call statistics with the lowest listening quality (LQ) MOS first.
sort-by out-of-order	Optional. Displays past call statistics with the highest number of out-of-order packets first.

sort-by pq-mos	Optional. Displays past call statistics with the lowest perceived quality (PQ) MOS first.
source-uri <*string*>	Optional. Displays past call statistics based on a substring of the URI/extension from which the RTP stream is sourced.
to-uri <*string*>	Optional. Displays past call statistics based on a substring of the To uniform resource identifier (URI) or extension to which this RTP stream is destined.

Default Values

By default, only the most commonly used statistics are shown.

Functional Notes

These statistics will still be available even if VQM is disabled.

Command History

Release 17.1	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

In the following example, VQM past call statistics are sorted by lost packets:

```
#show rtp quality-monitoring call-history sort-by loss
    Displaying 30 estimated stream statistics from 15 completed calls

    RTP stream: 3.3.3.3 : 50000, ppp 1 -> 1.1.1.1 : 3000, vlan 1
    To: 5551234@voip.com
        Call-start (duration): 11 Apr 2010 20:58:39 (93 s)
        MOS LQ: 3.800
        MOS PQ: 3.800
        Loss: 413 pkts
        Out-of-order: 30 pkts
        CODEC: g711

    RTP stream: 1.1.1.1 : 3000, vlan 1 -> 3.3.3.3: 50000, ppp 1
    To: 5551234@voip.com
    From: 5551235@voip.com
        Call-start (duration): 11 Apr 2010 20:58:39 (93 s)
        MOS LQ: 3.800
        MOS PQ: 3.800
        Loss: 0 pkts
        Out-of-order: 0 pkts
        CODEC: g711
--MORE--
```

show rtp quality-monitoring endpoints

Use the **show rtp quality-monitoring endpoints** command to display the voice quality monitoring (VQM) statistics gathered on inbound Realtime Transport Protocol (RTP) streams for all voice endpoints. These statistics can be sorted by mean opinion score (MOS), jitter, or lost or out-of-order packets. Variations of this command include:

show rtp quality-monitoring endpoints
show rtp quality-monitoring endpoints sort-by jitter
show rtp quality-monitoring endpoints sort-by loss
show rtp quality-monitoring endpoints sort-by lq-mos
show rtp quality-monitoring endpoints sort-by out-of-order
show rtp quality-monitoring endpoints sort-by pq-mos
show rtp quality-monitoring endpoints summary

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

sort-by jitter	Optional. Displays voice endpoint statistics with the highest amount of jitter first.
sort-by loss	Optional. Displays voice endpoint statistics with the highest number of lost packets first.
sort-by lq-mos	Optional. Displays voice endpoint statistics with the lowest listening quality (LQ) MOS first.
sort-by out-of-order	Optional. Displays voice endpoint statistics with the highest number of out-of-order packets first.
sort-by pq-mos	Optional. Displays voice endpoint statistics with the lowest perceived quality (PQ) MOS first.
summary	Optional. Displays a summary of all voice endpoint VQM statistics.

Default Values

By default, only the most commonly used statistics are shown.

Functional Notes

These statistics will still be available even if VQM is disabled.

Command History

Release 17.1	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

In the following example, VQM endpoint statistics are summarized:

#show rtp quality-monitoring endpoints summary

Displaying 2 estimated endpoint statistics from 50 completed calls

RTP source: 3.3.3.3, ppp 1

Quality	Completed Calls	MOS range
Excellent	0	4.40 - 4.00
Good	0	3.99 - 3.60
Fair	24	3.59 - 2.60
Poor	3	2.59 - 0.00
Totals:	27 (of the last 100 recorded calls)	

RTP source: 5.5.5.5, ppp 1

show rtp quality-monitoring interface

Use the **show rtp quality-monitoring interface** command to display the voice quality monitoring (VQM) statistics gathered from monitored calls on inbound Realtime Transport Protocol (RTP) streams across interfaces with VQM enabled. These statistics can be sorted by mean opinion score (MOS), jitter, or lost or out-of-order packets. Variations of this command include:

show rtp quality-monitoring interface
show rtp quality-monitoring interface *<interface>*
show rtp quality-monitoring interface *<interface>* **detail**
show rtp quality-monitoring interface detail
show rtp quality-monitoring interface *<interface>* **sort-by jitter**
show rtp quality-monitoring interface sort-by jitter
show rtp quality-monitoring interface *<interface>* **sort-by loss**
show rtp quality-monitoring interface sort-by loss
show rtp quality-monitoring interface *<interface>* **sort-by lq-mos**
show rtp quality-monitoring interface sort-by lq-mos
show rtp quality-monitoring interface *<interface>* **sort-by out-of-order**
show rtp quality-monitoring interface sort-by out-of-order
show rtp quality-monitoring interface *<interface>* **sort-by pq-mos**
show rtp quality-monitoring interface sort-by pq-mos
show rtp quality-monitoring interface *<interface>* **summary**
show rtp quality-monitoring interface summary

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Optional. Displays details of all available VQM interface statistics.
<interface>	Optional. Displays VQM statistics for a specific interface. Specify the interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; and for an ATM subinterface, use **atm 1.1**.
sort-by jitter	Optional. Displays VQM interface statistics with the highest amount of jitter first.
sort-by loss	Optional. Displays VQM interface statistics with the highest number of lost packets first.
sort-by lq-mos	Optional. Displays VQM interface statistics with the lowest listening quality (LQ) MOS first.

sort-by out-of-order	Optional. Displays VQM interface statistics with the highest number of out-of-order packets first.
sort-by pq-mos	Optional. Displays VQM interface statistics with the lowest perceived quality (PQ) MOS first.
summary	Optional. Displays a summary of VQM interface statistics.

Default Values

By default, only the most commonly used statistics are shown.

Functional Notes

These statistics will still be available even if VQM is disabled.

Command History

Release 17.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Usage Examples

In the following example, a summary of all VQM interface statistics is shown:

```
#show rtp quality-monitoring interface summary
    ppp 1
        Quality         Completed Calls         MOS range
        -----------     ------------------------ -----------------
        Excellent       0                       4.40 - 4.00
        Good            2                       3.99 - 3.60
        Fair            34                      3.59 - 2.60
        Poor            3                       2.59 - 0.00
        -----------     ------------------------ -----------------
        Totals:         37 (of the last 100 recorded calls)

    vlan 1
        Quality         Completed Calls         MOS range
        -----------     ------------------------ -----------------
        Excellent       36                      4.40 - 4.00
        Good            1                       3.99 - 3.60
        Fair            0                       3.59 - 2.60
        Poor            0                       2.59 - 0.00
        -----------     ------------------------ -----------------
        Totals:         37 (of the last 100 recorded calls)
```

show rtp quality-monitoring reporter

Use the **show rtp quality-monitoring reporter** command to display voice quality monitoring (VQM) reporter statistics. Variations of this command include:

show rtp quality-monitoring reporter
show rtp quality-monitoring reporter realtime
show rtp quality-monitoring reporter <*name*>
show rtp quality-monitoring reporter <*name*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*name*>	Optional. Specifies that only the statistics for the named VQM reporter are displayed.
realtime	Optional. Specifies that output is displayed in real time.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword.

Functional Notes

Output of the **show rtp quality-monitoring reporter** command displays the reporter name (**Name**), the queue volume or how many reports are waiting to send requests or receive responses (**Depth**), how many successful responses have been received (**Success**), how many failure responses have been received (**Failed**), how many requests have been transmitted (**Request**), how many challenge responses have been received (**Chalnge**), how many requests did not receive responses at all (**Rollovr**), and how many reports were discarded because the retry limit was exceeded (**Discard**).

Usage Examples

The following is sample output from this command showing VQM reporter statistics for all configured VQM reporters:

>**enable**
#show rtp quality-monitoring reporter

Name	Depth	Success	Failed	Request	Chalnge	Rollovr	Discard
Test 1	4	0	0	36	0	36	6
Test 2	4	0	0	36	0	36	6
Test 3	0	0	10	10	0	0	0
Test 4	0	0	10	10	0	0	0
Test 5	0	0	0	0	0	0	0

show rtp resources

Use the **show rtp resources** command to display Realtime Transfer Protocol (RTP) resource information. Variations of this command include:

show rtp resources
show rtp resources debug

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

debug	Optional. Activates the RTP resources event debug messages.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 14.1	Command was expanded to include more options.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show rtp resources** command:

```
>enable
#show rtp resources
DSP      Channel    Type     Port     Status
-------------------------------------------------------------------------
 0/1       1         RTP      N/A      Available
 0/1       2         RTP      N/A      Available
 0/1       3         RTP      N/A      Available
 0/1       4         RTP      N/A      Available
 0/1       5         RTP      N/A      Available
 0/1       6         RTP      N/A      Available
 0/1       7         RTP      N/A      Available
 0/1       8         RTP      N/A      Available
--MORE--
```

checksum	Optional. Displays the encrypted message digest 5 (MD5) version of the running configuration.
counter-profile	Optional. Displays the current running configuration for all counter profiles.
counter-profile <*slot/index*>	Optional. Displays the current running configuration for the specified counter profile. Specify a counter profile in the format <*slot/index*>. For example, **0/1**.
dynamic-counter	Optional. Displays the current running configuration for all counter profiles.
dynamic-counter <*slot/index*>	Optional. Displays the current running configuration for the specified counter profile. Specify a counter profile in the format <*slot/index*>. For example, **0/1**.
evc	Optional. Displays the current running configuration for all EVCs.
evc <*name*>	Optional. Displays the current running configuration for the specified EVC.
evc-map	Optional. Displays the current running configuration for all EVC maps.
evc-map <*name*>	Optional. Displays the current running configuration for the specified EVC map.
ethernet loopback facility	Optional. Displays the current running configuration for all facility loopback objects.
ethernet loopback terminal	Optional. Displays the current running configuration for all terminal loopback objects.
<*name*> <*slot*>	Optional. Displays the current running configuration for the facility or terminal loopback object with the specified name and slot identifier.
slot <*slot*>	Optional. Displays the current running configuration for all facility or terminal loopback objects with the specified slot identifier.
hmr	Optional. Displays the current running configuration for Session Initiation Protocol (SIP) header manipulation rules (HMR).
hmr policy	Optional. Displays the configured SIP HMR policies in the running configuration.
hmr policy <*name*>	Optional. Displays the specified SIP HMR policy in the running configuration.
hmr rule-set	Optional. Displays the configured SIP HMR rule sets in the running configuration.
hmr rule-set <*name*>	Optional. Displays the specified SIP HMR rule set in the running configuration.
ip access-lists	Optional. Displays the current running configuration for all configured IPv4 access control lists (ACLs).

interface <*interface*>	Optional. Displays the current running configuration for a particular interface. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id* | *ap* | *ap/radio* | *ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show running-config interface ?** for a complete list of valid interfaces.
ip-crypto	Optional. Displays the current running configuration for all IPv4 Internet Protocol security (IPsec) virtual private network (VPN) settings.
ip mgcp	Optional. Displays the current running configuration for all Media Gateway Control Protocol (MGCP) parameters.
ip nat pool	Optional. Displays the current running configuration for IPv4 network address translation (NAT) pool parameters.
ip policy-class	Optional. Displays the current running configuration for all configured IPv4 access control policies (ACPs).
ip rtp	Optional. Displays the current running configuration for all IPv4 Realtime Transport Protocol (RTP) parameters.
ip security monitor	Optional. Displays the current running configuration for all IPv4 security monitor parameters.
ip urlfilter	Optional. Displays the current running configuration for all IPv4 uniform resource locator (URL) filters.
license	Optional. Displays the current running configuration for all software licenses.
license key	Optional. Displays the current running configuration for all software license keys.
mef	Optional. Displays the current running configuration for all Metro Ethernet Forum (MEF) components.
network-sync	Optional. Displays the current running configuration for network synchronization (Network Sync).
packet-capture	Optional. Displays the current running configuration for all configured packet captures.
<*name*>	Optional. Limits output to a single packet capture.
policer	Optional. Displays the current running configuration for all policers.
policer <*name*>	Optional. Displays the current running configuration for the specified policer.
probe	Optional. Displays the current configuration for all running probes.
qos-map	Optional. Displays the current running configuration for all configured quality of service (QoS) maps.

quality-monitoring	Optional. Displays the current running configuration for voice quality monitoring (VQM).
queue	Optional. Displays the current running configuration for all queues.
queue interface <*interface*>	Optional. Displays the current running configuration for all queues on the specified interface. Specify an interface in the format <*interface type [slot/group* | *slot/port* | *interface id*>. For example, for an EFM group interface, use **efm-group 1/3**; or for a Gigabit Ethernet interface, use **gigabit-ethernet 0/1**. Type **show running-config queue interface ?** for a complete list of valid interfaces.
router bgp	Optional. Displays the current Border Gateway Protocol (BGP) configuration.
router ospf	Optional. Displays the Open Shortest Path First version 2 (OSPFv2) configuration.
router ospfv3	Optional. Displays the OSPF version 3 (OSPFv3) configuration.
<*process id*>	Optional. Limits output to a single OSPFv3 process. Valid range is **1** to **65535**.
router pim-sparse	Optional. Displays the current global protocol-independent multicast-sparse mode (PIM-SM) configuration.
router rip	Optional. Displays the Routing Information Protocol (RIP) configuration.
sdp	Optional. Displays the current running configuration for all Session Description Protocol (SDP) parameters.
shaper	Optional. Displays the current running configuration for all traffic shapers.
shaper <*name*>	Optional. Displays the current running configuration for the specified traffic shaper.
sip	Optional. Displays the current running configuration for all Session Initiation Protocol (SIP) parameters.
sip proxy failover	Optional. Displays the current running configurations for SIP proxy failover.
sip proxy user-template <*name*>	Optional. Displays the current running configuration for the specified SIP proxy user template.
srtp-profile	Optional. Displays the current running configuration for any configured Secure Realtime Transfer Protocol (SRTP) profiles.
system-control-evc	Optional. Displays the current running configuration for the system control Ethernet virtual connection (EVC).
system-management-evc	Optional. Displays the current running configuration for the system management EVC.
tcl script <*name*>	Optional. Displays the specified tool command language (Tcl) script.

tls-profile	Optional. Displays the current running configuration for any configured Transport Layer Security (TLS) profiles.
track	Optional. Displays the current running configuration for all tracks.
vcid <*vcid*>	Optional. Displays the current running configuration for the specified virtual chassis ID of an ActivChassis member. Valid VCID range is **1** to **8**. VCID values **1** and **2** are given to the ActivChassis master and backup devices, respectively.
verbose	Optional. Displays the entire running configuration to the terminal screen (versus only the nondefault values).

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) and tunnel interfaces.
Release 11.1	Demand, foreign exchange office (FXO), and serial interfaces were added. The **ip-crypto** and **router pim-sparse** keywords were added.
Release 13.1	Command was expanded to include the **ip rtp**, **ip sdp**, **probe** and **track** subcommands.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**, and the **ip urlfilter** and **quality-monitoring** keywords.
Release A1	Command was introduced in the AOS voice products.
Release A2	Command was expanded to include the **mgcp** parameter.
Release 17.4	Command was expanded to include the **ip nat pool** parameter.
Release 17.5	Command was expanded to include the **security monitor** parameter.
Release A4.01	Command was expanded to include the Ethernet in the first mile (EFM) group interface and the **ip sip proxy user-template** parameter. Command was expanded to include the Metro Ethernet Forum (MEF) parameter and the MEF Ethernet interface.
Release 17.9	Command was changed to require the **ip** keyword for the **access-list** and **policy-class** parameters for Adtran internetworking products only.
Release A4.05	Command was expanded to include the asymmetric digital subscriber line (ADSL) interface.
Release 18.2	Command was expanded to include the **ip sip proxy failover** parameter.

Release A5.01	Command was expanded to include the Gigabit Ethernet and gigabit switchport interfaces.
Release R10.1.0	Command was expanded to include the **hmr** parameters. Command was also changed to require the **ip** keyword for the **access-list** and **policy-class** parameters for Adtran voice products.
Release R10.4.0	Command was expanded to include the **license** and **license key** parameters.
Release R10.5.0	Command was expanded to include the **auto-config, router ospf**, **router ospfv3**, and **router rip** parameters.
Release R10.7.0	Command was expanded to include the **auto-link**, **packet-capture**, and **vcid** parameters.
Release R10.8.0	Command syntax was changed to remove the **ip** keyword from the **sdp** and **sip** parameters.
Release R10.11.0	Command was expanded to include the **counter-profile**, **dynamic-counter**, and **network-sync** parameters.
Release R11.1.0	Command was expanded to include the very high-speed digital subscriber line (VDSL) interfaces and the **ethernet loopback facility** and **tcl script** parameter.
Release R11.3.0	Command was expanded to include the <*process id*> parameter for OSPFv2.
Release R11.5.0	Command was expanded to include the **evc**, **evc-map**, **policer**, **queue**, **queue interface efm-group, queue interface gigabit-ethernet, shaper**, **srtp profile**, **system-control-evc**, **system-management-evc**, and **tls profile** parameters.
Release R11.7.0	Command was expanded to include the 10 Gigabit switchport interface.
Release R13.7.0	Command was expanded to include the **terminal** loopback parameter.

Usage Examples

The following is sample output from the **show running-config** command:

```
>enable
#show running-config
Building configuration...
!
no enable password
!
ip subnet-zero
ip classless
ip routing
!
event-history on
no logging forwarding
```

```
logging forwarding priority-level info
no logging email
!
!ip policy-timeout tcp all-ports 600
ip policy-timeout udp all-ports 60
ip policy-timeout icmp 60
!
interface eth 0/1
--MORE--
```

show running-config ipv6

Use the **show running-config ipv6** command to display all the nondefault parameters contained in the current Internet Protocol version 6 (IPv6) running configuration file. Specific portions of the running configuration may be displayed, based on the command entered. Variations of this command include the following:

show running-config ipv6 access-lists
show running-config ipv6 access-lists verbose
show running-config ipv6 crypto
show running-config ipv6 crypto verbose
show running-config ipv6 dhcp pool <*name*>
show running-config ipv6 dhcp pool <*name*> **verbose**
show running-config ipv6 policy-class
show running-config ipv6 policy-class verbose

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

access-lists	Displays the current running configuration for all configured IPv6 access control lists (ACLs).
crypto	Displays the current running configuration for all configured IPv6 crypto functions.
dhcp pool <*name*>	Displays the current running configuration for the specified Dynamic Host Control Protocol version 6 (DHCPv6) server address pool.
policy-class	Displays the current running configuration for all configured IPv6 access control policies (ACPs).
verbose	Optional. Displays the entire running configuration to the terminal screen (versus only the nondefault values).

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release 18.3	Command was expanded to include the **dhcp pool** parameter.
Release R10.7.0	Command was expanded to include the **crypto** parameter.

Usage Examples

The following example displays the IPv6 ACLs in the unit's running configuration:

```
>enable
#show running-config ipv6 access-lists
    ipv6 access-list extended Privatev6
        deny tcp any eq telnet any
        deny tcp any any eq telnet
        permit ipv6 any host 2000:1::1
        permit icmp any any
```

The following example displays the configured IPv6 ACPs in the unit's running configuration:

```
>enable
#show running-config ipv6 policy-class
ipv6 policy-class UNTRUSTED
        allow list localservicev6
        discard list Webtraffic
```

show running-config voice

Use the **show running-config voice** command to show running voice configurations. Variations of this command include the following:

show running-config voice
show running-config voice ani
show running-config voice ani verbose
show running-config voice ani-list
show running-config voice ani-list verbose
show running-config voice ani-list <*name*>
show running-config voice ani-list <*name*> **verbose**
show running-config voice autoattendant
show running-config voice autoattendant verbose
show running-config voice class-of-service
show running-config voice class-of-service verbose
show running-config voice class-of-service <*name*>
show running-config voice class-of-service <*name*> **verbose**
show running-config voice directory
show running-config voice directory verbose
show running-config voice grouped-trunk
show running-config voice grouped-trunk verbose
show running-config voice grouped-trunk <*name*>
show running-config voice grouped-trunk <*name*> **verbose**
show running-config voice line
show running-config voice line verbose
show running-config voice line <*number*>
show running-config voice line <*number*> **verbose**
show running-config voice mail
show running-config voice mail verbose
show running-config voice match
show running-config voice match ani
show running-config voice match ani verbose
show running-config voice mgcp-endpoint
show running-config voice mgcp-endpoint verbose
show running-config voice mgcp-endpoint <*index*>
show running-config voice mgcp-endpoint <*index*> **verbose**
show running-config voice music-on-hold
show running-config voice music-on-hold mode
show running-config voice music-on-hold player
show running-config voice music-on-hold player <*name*>
show running-config voice music-on-hold preferredCodec
show running-config voice named-digit-timeouts
show running-config voice named-digit-timeouts verbose
show running-config voice named-digit-timeouts <*name*>
show running-config voice named-digit-timeouts <*name*> **verbose**

show running-config voice operator-group
show running-config voice operator-group verbose
show running-config voice paging-group
show running-config voice paging-group verbose
show running-config voice paging-group *<extension>*
show running-config voice paging-group *<extension>* **verbose**
show running-config voice pickup-group
show running-config voice pickup-group *<name>*
show running-config voice queue
show running-config voice queue *<extension>*
show running-config voice queue verbose
show running-config voice queue *<extension>* **verbose**
show running-config voice ring-group
show running-config voice ring-group verbose
show running-config voice ring-group *<name>*
show running-config voice ring-group *<name>* **verbose**
show running-config voice ring-option
show running-config voice ring-option verbose
show running-config voice ring-option *<name>*
show running-config voice ring-option *<name>* **verbose**
show running-config voice speed-dial
show running-config voice speed-dial verbose
show running-config voice spre
show running-config voice spre verbose
show running-config voice spre-map
show running-config voice spre-map verbose
show running-config voice status-group
show running-config voice status-group verbose
show running-config voice status-group *<name>*
show running-config voice status-group *<name>* **verbose**
show running-config voice trunk
show running-config voice trunk verbose
show running-config voice trunk *<Txx>*
show running-config voice trunk *<Txx>* **verbose**
show running-config voice trunk-list
show running-config voice trunk-list verbose
show running-config voice trunk-list *<name>*
show running-config voice trunk-list *<name>* **verbose**
show running-config voice user
show running-config voice user verbose
show running-config voice user *<number>*
show running-config voice user *<number>* **verbose**
show running-config voice user *<name>*
show running-config voice user *<name>* **verbose**
show running-config voice user *<name>* *<last name>*
show running-config voice user *<name>* *<last name>* **verbose**

show running-config voice verbose

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

ani	Optional. Displays automatic number identification (ANI) substitution configurations.
ani-list	Optional. Displays all ANI list configurations.
ani-list <*name*>	Optional. Deploys a specific ANI list configuration.
autoattendant	Optional. Displays auto attendant configuration.
class-of-service	Optional. Displays all voice class of service (CoS) configurations.
class-of-service <*name*>	Optional. Displays voice CoS configurations for the specified rule set.
directory	Optional. Displays voice directory configuration.
grouped-trunk	Optional. Displays all voice trunk group configurations.
grouped-trunk <*name*>	Optional. Displays voice trunk group configurations for the specified trunk.
line	Optional. Displays the voice line configuration.
line <*number*>	Optional. Displays the voice line configuration for a specified extension.
mail	Optional. Displays voicemail configuration.
match	Optional. Displays all substitution configurations.
match ani	Optional. Displays ANI substitution configurations.
mgcp-endpoint	Optional. Displays all Media Gateway Control Protocol (MGCP) endpoint configurations.
mgcp-endpoint <*index*>	Optional. Displays a specific MGCP endpoint configuration.
music-on-hold	Optional. Displays all Music on Hold (MoH) configurations.
music-on-hold mode	Optional. Displays all MoH mode configurations.
music-on-hold player	Optional. Displays all MoH player configurations.
music-on-hold player <*name*>	Optional. Displays the MoH player configuration for the specified player.
named-digit-timeouts	Optional. Displays all named-digit-timeouts.
named-digit-timeouts <*name*>	Optional. Displays configuration for the specified named-digit-timeout.
operator-group	Optional. Displays operator group configuration.
paging-group	Optional. Displays all handset paging group configurations.
paging-group <*extension*>	Optional. Displays handset paging group configuration for the specified paging group.
pickup-group	Optional. Displays all call pickup group configurations.

pickup-group <*name*>	Optional. Displays call pickup group configuration for the specified call pickup group.
queue	Optional. Displays all call queue configurations.
queue <*extension*>	Optional. Displays call queue configuration for the specified call queue.
ring-group	Optional. Displays all configured ring groups.
ring-group <*name*>	Optional. Displays ring group configurations for the specified ring group.
ring-option	Optional. Displays all ring option configurations.
ring-option <*name*>	Optional. Displays ring option configurations for the specified ring option.
speed-dial	Optional. Displays all entries for speed-dial entries.
spre	Optional. Displays entire special prefix (SPRE) related configuration, including mode, overrides, local maps, and network template.
spre-map	Optional. Displays only the SPRE mapping configuration.
status-group	Optional. Displays all status group information.
status-group <*name*>	Optional. Displays information on the specified status group.
trunk	Optional. Displays all voice trunk configurations.
trunk <*Txx*>	Optional. Displays voice trunk configurations for the specified trunk. Use the trunk's two-digit identifier following T (for example, **T99**).
trunk-list	Optional. Displays all trunk list configurations.
trunk-list <*name*>	Optional. Displays a specific trunk list configuration.
user	Optional. Displays all configured voice users.
<*number*>	Optional. Displays voice user configurations for the specified number.
<*name*>	Optional. Displays voice user configurations for the specified name. Enter the first or last name.
<*last name*>	Optional. Displays voice user configurations for the specified name. Enter the last name only.
verbose	Optional. Displays detailed information on all or on the specified voice running configurations.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 11.1	Command was expanded.
Release 13.1	Command was expanded.
Release 14.1	Command was expanded.
Release 15.1	Command was expanded.
Release 16.1	Command was expanded.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include** parameters.

Release A2	Command was expanded to include the **ani-list**, **match**, **mgcp-endpoint**, **named-digit-timeouts**, **trunk-list**, and **user** parameters.
Release A2.03	Command was expanded to include the **spre** and **spre-map** parameters.
Release A2.04	Command was expanded to include the **paging-group** parameter.
Release A4.01	Command was expanded to include the **pickup-group** parameter, **voice queue**, and **music-on-hold**.
Release R10.7.0	Command was expanded to include the **ring-option** parameter.

Usage Examples

The following is sample output from the **show running-config voice** command:

```
>enable
#show running-config voice
Building configuration...
!
voice hold-reminder 15
voice flashhook mode interpreted
!
voice dial-plan 1 local 8000
!
voice class-of-service set1
 billing-codes
!
voice class-of-service set2
!
voice class-of-service “set 1"
!
voice codec-list trunk
 default
 codec g711ulaw
 codec g729
!
voice codec-list “list 1"
!
voice codec-list list1
!
voice trunk T99 type t1-rbs supervision wink role network
!
voice trunk T01 type sip
!
voice trunk T07 type t1-rbs supervision wink role network
!
voice trunk T02 type t1-rbs supervision wink role network
!
--MORE--
```

show schedule

Use the **show schedule** command to display information regarding the schedule configuration.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show schedule** command:

```
>enable
#show schedule
Schedule entry: DELAY-AFTER-BOOT (active)
Schedule entry: DELAY (inactive)
```

Technology Review

The scheduler provides a method for configuring a feature to operate during a specific time schedule and to receive feedback when the feature should disable or enable. The goal of the scheduler is to eliminate redundant code while providing an understandable, streamlined application program interface (API) for rapid feature development with schedules. The **show schedule** command displays how many features are scheduled and whether they are active or inactive.

show sfp-info interface *<interface>*

Use the **show sfp-info interface gigabit-switchport** command to display small form-factor pluggable (SFP) transceiver module serial ID information for the specified interface.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<interface>	Specifies an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id | ap | ap/radio | ap/radio.vap]>*. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show spanning-tree interface ?** for a complete list of valid interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Functional Notes

Fields in the **show** command output reported as **Unspecified** are not applicable to the module type. Refer to the *Usage Examples* for more information.

Usage Examples

The following is sample output from the **show sfp-info interface gigabit-switchport** *<slot/port>* command:

```
>enable
#show sfp-info interface gigabit-switchport 0/25

SFP Manufacturer: FINISAR CORP.
  Identifier: SFP Transceiver
  Connector: LC
  SONET Compliance Code: Unspecified
```

Gigabit Ethernet Compliance Code: 100BASE-SX
Fiber Channel Link Length: Intermediate Distance <I>
Fiber Channel Transmitter Technology: Shortwave laser w/o OFC <SN>
Fiber Channel Transmitter Media: Multi-Mode, 62.5m <M6>
Fiber Channel Speed: 200 MB/sec
Encoding: 8B10B
Nominal Bit Rate: 2100 Mb/s
Supported Single-Mode Link Length <Km units>: Unspecified
Supported Single-Mode Link Length <100m units>: Unspecified
Supported Multi-Mode <50micron> Link Length <10m units>: 30
Supported Multi-Mode <62.5micron> Link Length <10m units>: 15
Supported Link Length Copper: Unspecified
Vendor OUI: 00:90:65
Vendor Part Number: FTRJ8519P1BNL
Vendor Revision: A
Options: LOS, TX_DISABLE
Bitrate, Max: Unspecified
Bitrate, Min: Unspecified
Vendor Serial Number: PA41HCB
Datecode: Jul 31. 2005

show sfp-info summary

Use the **show sfp-info summary** command to display a summary of all of the small form-factor pluggable (SFP) transceiver modules currently installed in the unit.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.

Functional Notes

This command displays the interface in which the module is installed, the manufacturer of the module, and, if supported, the Rx power, Tx power, and temperature.

Usage Examples

The following is sample output from the **show sfp-info summary** command:

```
>enable
#show sfp-info summary
```

Interface	SFP Manufacturer	Rx Power	Tx Power	Temperature
xgiga-swx 1/2/1	OPNEXT, INC.	0.56mW	0.57mW	33 Celsius
xgiga-swx 4/2/1	MergeOptics GmbH	0.67mW	0.45mW	37 Celsius
xgiga-swx 4/2/1	OPNEXT, INC.	0.63mW	0.57mW	34 Celsius
xgiga-swx 5/2/1	FCI MergeOptics	0.59mW	0.64mW	34 Celsius
xgiga-swx 5/2/2	Molex Inc.	mW	mW	Celsius
xgiga-swx 6/2/1	Molex Inc.	mW	mW	Celsius
xgiga-swx 6/2/2	Axcen Photonics	0.15mW	0.00mW	26 Celsius

show sftp sftp-client mypubkey

Use the **show sftp sftp-client mypubkey** command to display the Secure File Transfer Protocol SFTP secure shell (SSH) public key information.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R13.11.0	Command was introduced.

Usage Examples

The following example displays SFTP SSH DSA and RSA public key hashes:

```
>enable
#show sftp sftp-client mypubkey

DSA Hash: ---- BEGIN SSH2 PUBLIC KEY ----
Comment: Adtran DSA Public key
AAAAB3NzaC1kc3MAAAEBALq7iC0mltbBGo2EzQ3ZDekHl3t2DLa08mP1AxrDdZdl

show shaper

Use the **show shaper** command to display configuration information for Ethernet virtual connection (EVC) traffic shapers. Variations of this command include:

show shaper

show shaper <*name*>

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*name*>	Optional. Specifies that information for a single traffic shaper is displayed.

Default Values

By default, no traffic shapers are configured.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display information for all configured EVC traffic shapers:

>**enable**
#show shaper

Name	State	Status
1	Disabled	Disabled

Attributes:
    Configured Rate : 1000000 kbps
    Mode : Not applied

show sip

Use the **show sip** command to display Session Initiation Protocol (SIP) statistical and registration information. Variations of this command include:

show sip auxiliary-transactions
show sip resources
show sip statistics
show sip user-registration
show sip user-registration *<user>*
show sip user-registration detail
show sip user-registration user-agent

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

auxiliary-transactions	Displays SIP auxiliary transaction information.
resources	Displays SIP server resource information.
statistics	Displays SIP server statistic information.
user-registration	Displays local SIP server registration information for all users.
<user>	Optional. Displays local SIP server registration information for the specified user.
detail	Optional. Displays a detailed listing of the local SIP server registration information for all users.
user-agent	Optional. Displays the SIP user agent information for all users.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 11.1	**Resources**, **statistics**, and **user-registration** parameters were added.
Release 15.1	**Name-service name-table** parameter was added.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.3	Command was altered to remove the **name-service name-table** parameter, which was replaced with the **show voip name-service name-table** command.

Release R10.5.0	Command was expanded to include the **auxiliary-transactions** parameter.
Release R10.8.0	Command was expanded to include the <*user*>, **detail**, and **user-agent** parameters.

Usage Examples

The following is sample output from the **show sip statistics** command:

```
>enable
#show sip statistics

Invites transmitted: 36
Invites received: 26

Invite Retransmits transmitted: 11
Invite Retransmits received: 0
Non-Invites transmitted: 1869
Non-Invites received: 1911

Non-Invite Retransmits transmitted: 12
Non-Invite Retransmits received: 41

Responses transmitted: 1982
Responses received: 3535

Response Retransmits transmitted: 45
Response Retransmits received: 0
```

The following is sample output from the **show sip user-registration** command:

```
>enable
#show sip user-registration

User            IP Address      Port        Transport   Expires
-------------------------------------------------------------------------------------------------
9001            10.10.10.1      5060        UDP         2081
9002            10.10.10.2      5060        UDP         3419

Total phones registered: 2
```

show sip location

Use the **show sip location** command to display Session Initiation Protocol (SIP) statistical and registration information. Variations of this command include:

show sip location
show sip location dynamic
show sip location static

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

dynamic	Optional. Displays SIP location database dynamic entries.
static	Optional. Displays SIP location database static entries.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 12.1	Command output was updated.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show sip location static** command:

```
>enable
#show sip location static
User       IP Address     Port     Expires     Source
-------------------------------------------------------------------------
9001       1.1.1.2        5060     52          Registrar
9002       10.10.10.2     5060     3336        Registrar
```

show sip proxy

Use the **show sip proxy** command to display Session Initiation Protocol (SIP) proxy statistical and registration information. Variations of this command include:

show sip proxy monitor
show sip proxy registration
show sip proxy registration extended
show sip proxy registration range *<range>*
show sip proxy registration range *<range>* **extended**
show sip proxy registration range *<range>* **realtime**
show sip proxy registration realtime
show sip proxy registration user *<user>*
show sip proxy registration user *<user>* **extended**
show sip proxy registration user *<user>* **realtime**
show sip proxy registration verbose
show sip proxy resources
show sip proxy resources realtime
show sip proxy user
show sip proxy user extended
show sip proxy user realtime
show sip proxy user verbose

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

monitor	Displays SIP proxy monitor status.
registration	Displays the SIP Proxy registration status for SIP proxy users.
range *<range>*	Optional. Specifies a range of consecutive extensions to display, for example, **2565551000-2565551200**.
user *<user>*	Optional. Specifies a single user extension to display.
resources	Displays SIP proxy resource information.
user	Displays SIP proxy user database information.
extended	Optional. Displays the extended form of SIP proxy user database.

realtime	Optional. Displays SIP proxy information in real time. Refer to the *Functional Notes* below for more information.
verbose	Optional. Activates detailed debug messages.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.3	Command was expanded to include the **extended** modifier.
Release A2.03	Command was expanded to include the **verbose** modifier.
Release A5.02	Command was expanded to include the **registration**, **range** <*range*>, and **user** <*user*> parameters.
Release R10.9.0	Command was expanded to include the **monitor** parameter.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show sip proxy monitor** command:

```
>enable
#show sip proxy monitor

Proxy Server Monitor:              Admin UP
Polling mode:                      On failure
Continuous interval:               30
Delay:                             Min <min> Max <max> | Disabled
Recovery no-response interval:     5 - 60
Recovery responses needed:         3  Interval 10

Servers:
Address                            Port        Status      Poll
---------------------------------- ------      --------    -------------------
10.255.3.2                         5060        DOWN        Next poll 12 seconds
10.17.233.254                      5060        UP*
```

10.17.1.254 5060 UP

The following is sample output from the **show sip proxy resources** command:

>**enable**
#show sip proxy resources

Type	Name	Allocated	Currently in Use	Max Used
Proxy	proxyPoolElements	630	0	0

show sip secure remote-user

Use the **show sip secure remote-user** command to display Session Initiation Protocol (SIP) security statistics pertaining to remote users attempting to access the system. Variations of this command include:

show sip secure remote-user
show sip secure remote-user blacklist
show sip secure remote-user dropped-requests

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

blacklist	Optional. Displays UDP SIP security blacklist entries.
dropped-requests	Optional. Displays UDP SIP security dropped requests due to failed authentication attempts.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.

Functional Notes

These statistics display the number of dropped SIP requests and the type, such as REGISTER and INVITE, that were encountered on the configured secure port. Other requests include ACK, CANCEL, OPTIONS, SUBSCRIBE, NOTIFY, PUBLISH, INFO, REFER, MESSAGE, and UPDATE requests. The output also displays the number of suspect entries with summary information which includes the IPv4 address and voice user attempting a call. Once the number of failed attempts from an IPv4 address, regardless of its source port, exceeds the blacklist attack threshold, a blacklist entry is recorded and the IPv4 address is removed from the suspect list.

A maximum number of 100 combined entries can be stored in the suspect and blacklist entry tables. If the maximum number is exceeded, the oldest entries from the suspect list are removed as needed to make room for new blacklist entries, and no new suspect entries are added. When there are no suspect entries left to sacrifice for space, no more blacklists entries will be added until blacklist entries are removed either manually (using the command *clear sip secure remote-user on page 207*) or through timeouts.

Usage Examples

The following is sample output from the **show sip secure remote-user** command:

>**enable**
#show sip secure remote-user

Dropped SIP Request Information:

Port	Protocol	Registers	Invites	Other Requests
2112	UDP	0	33	0

Number of secure ports: 1
Suspect Entries:
10.10.23.2 : 2112 / UDP
  User/Agent: 2565551234/Adtran-SIP-IP706/v2.4.0.3
  Timeout (seconds): 600
Total suspect entries: 1

Blacklisted Entries:
10.10.19.1 : 2112 / UDP
  User/Agent: 2565556789/Adtran-SIP-IP706/v2.4.0.3
  Timeout (seconds): 3600
Total blacklisted entries: 1

* Port, protocol, and User/Agent values taken from first suspect SIP message

show sip trunk-registration

Use the **show sip trunk-registration** command to display Session Initiation Protocol (SIP) statistical and registration information. Variations of this command include the following:

show sip trunk-registration
show sip trunk-registration realtime
show sip trunk-registration registrar
show sip trunk-registration subscription
show sip trunk-registration verbose
show sip trunk-registration registrar realtime
show sip trunk-registration registrar <*Txx*>
show sip trunk-registration registrar <*Txx*> **realtime**
show sip trunk-registration registrar <*Txx*> <*name*>
show sip trunk-registration registrar <*Txx*> <*name*> **realtime**
show sip trunk-registration subscription <*Txx*>
show sip trunk-registration subscription <*Txx*> **realtime**
show sip trunk-registration subscription <*Txx*> <*name*>
show sip trunk-registration subscription <*Txx*> <*name*> **realtime**
show sip trunk-registration <*Txx*>
show sip trunk-registration <*Txx*> **realtime**
show sip trunk-registration <*Txx*> <*name*>
show sip trunk-registration <*Txx*> <*name*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*Txx*>	Optional. Specifies the trunk identity; where xx is the trunk's two-digit identifier (e.g., T01).
<*name*>	Optional. Specifies the name associated with the trunk.
realtime	Optional. Displays local SIP client registration information in real time. Refer to the *Functional Notes* below for more information.
registrar	Optional. Displays the SIP trunk registrar IP address information. Refer to the *Functional Notes* below for more information.

subscription	Optional. Displays SIP trunk registration subscription information.
verbose	Optional. Displays detailed SIP trunk registration information.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A5.01	Command was expanded to include the **registrar** parameter
Release R13.4.0	Command was expanded to include the **verbose** parameter.
Release R13.8.0	Command was expanded to include the **subscription** parameter.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the command *terminal length <number> on page 1133*).

Use the **registrar** to show the ip address of the registrar that each number is using on a SIP trunk. Numbers on the same SIP trunk can use different registrars if sip-server validation is enabled (using the command *sip-server validation register on page 5140*).

Usage Examples

The following is sample output from the **show sip trunk-registration** command:

```
>enable
#show sip trunk-registration

Ext     Register  Expire    Grant    Success  Redirect  Challenge  Failed  Timeout
-------------------------------------------------------------------------------------------------------------
4433    NO        0         0        0        0         0          0       #
```

show smdr

Use the **show smdr** command to display the statistics for station message detail record (SMDR) reporting. The output for this command includes each item from the configured SMDR output format (refer to the command *voice logging smdr format on page 1929*).

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R10.4.0	Command was introduced.

Usage Examples

The following example is sample output from the **show smdr** command:

```
>enable
#show smdr
SMDR Formatting:
CALLID[10]
Date(MM/DD/YYYY)[10]
Start Time(HH.MM.SS)[8]
Billable Mins[6]
Billing Code[4]
Call Type[2]
Originating Slot[2]
Originating Port[2]
Originating Name[15]
Originating Number[15]
Destination Slot[2]
Destination Port[2]
Destination Name[15]
Destination Number[15]
Conference ID[3]
```

show snmp

Use the **show snmp** command to display the system Simple Network Management Protocol (SNMP) current configuration. Variations of this command include the following:

show snmp engineID
show snmp group
show snmp user

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

engineID	Displays the hex string that defines the current local engine ID settings.
group	Displays the list of all groups entered.
user	Displays the list of all users entered.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 13.1	Command was expanded to include the **engineID**, **group**, and **user** options.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show snmp** command for a system with SNMP disabled, and the default chassis and contact parameters:

```
>enable
#show snmp
Chassis: Chassis ID
Contact: Customer Service
0 Rx SNMP packets
  0 Bad community names
  0 Bad community uses
  0 Bad versions
  0 Silent drops
```

The following is sample output from the **show snmp group** command for a situation in which a group called **securityV3auth** was defined (via the **snmp-server group** command) using version 3 and authentication, and no access control list:

```
>enable
#show snmp group
Group: securityV3auth                Security Model: v3
Read View: default                   Write View: <not specified>
Notify View: default
```

show sntp

Use the **show sntp** command to display the system Simple Network Time Protocol (SNTP) parameters and current status of SNTP communications.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays the SNTP parameters and current status:

```
>enable
#show sntp
```

show spanning-tree

Use the **show spanning-tree** command to display the status of the spanning-tree protocol. Variations of this command include:

show spanning-tree
show spanning-tree <*number*>
show spanning-tree detail
show spanning-tree detail active
show spanning-tree realtime
show spanning-tree <*number*> **realtime**
show spanning-tree summary

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command may adversely affect system performance and should be used with discretion.*

Syntax Description

<*number*>	Optional. Displays spanning tree for a specific bridge group. This command is only applicable to routers configured for bridging.
detail	Optional. Displays detailed spanning tree information.
active	Optional. Displays detailed information about all active interfaces.
realtime	Optional. Displays full-screen spanning tree information in real time.
summary	Optional. Displays a summary of all port states.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 10.1	Command was expanded to include the **realtime** parameter.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.5	Command was expanded to include the **detail**, **active**, and **summary** keywords.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show spanning-tree** command:

```
>enable
#show spanning-tree
Spanning Tree enabled protocol ieee
 Root ID    Priority    32768
            Address     00:a0:c8:00:88:41
            We are the root of the spanning tree
            Hello Time  2 sec Max Age 20 sec Forward Delay 15 sec
 Bridge ID Priority    32768
            Address     00:a0:c8:00:88:41
            Hello Time  2 sec Max Age 20 sec Forward Delay 15 sec
            Aging Time  300
Interface       Role    Sts     Cost    Prio. Nbr.  Type
eth 0/2         Desg    FWD     19      128.2       P2p
eth 0/3         Desg    FWD     19      128.3       P2p
eth 0/4         Desg    FWD     19      128.4       P2p
giga-eth 0/1    Desg    FWD     4       128.25      P2p
giga-eth 0/2    Desg    FWD     4       128.26      P2p
```

show spanning-tree active

Use the **show spanning-tree active** command to display the spanning-tree status on active interfaces only. Variations of this command include:

show spanning-tree active
show spanning-tree active detail

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

detail	Optional. Displays the spanning-tree protocol status in detail.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show spanning-tree active** command:

```
>enable
#show spanning-tree active
Spanning Tree enabled protocol ieee
 Root ID    Priority    32768
            Address     00:a0:c8:00:88:41
            We are the root of the spanning tree
            Hello Time   2 sec  Max Age 20 sec  Forward Delay 15 sec
Bridge ID Priority    32768
            Address     00:a0:c8:00:88:41
            Hello Time   2 sec  Max Age 20 sec  Forward Delay 15 sec
            Aging Time   300
eth 0/9         Desg FWD 19        128.9   P2p
eth 0/2         Desg FWD 19        128.24  P2p
--MORE--
```

show spanning-tree blockedports

Use the **show spanning-tree blockedports** command to display ports that are currently in a blocked state.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show spanning-tree blockedports** command:

```
>enable
#show spanning-tree blockedports
Blocked Interfaces List
-----------------------------------
eth 0/3
giga-eth 0/2
p-chan 1
Number of blocked ports (segments) in the system: 3
```

show spanning-tree interface <*interface*>

Use the **show spanning-tree interface** command to display spanning-tree protocol information for a particular interface. Variations of this command include:

show spanning-tree interface <*interface*>
show spanning-tree interface <*interface*> **active**
show spanning-tree interface <*interface*> **active detail**
show spanning-tree interface <*interface*> **cost**
show spanning-tree interface <*interface*> **edgeport**
show spanning-tree interface <*interface*> **inconsistency**
show spanning-tree interface <*interface*> **priority**
show spanning-tree interface <*interface*> **rootcost**
show spanning-tree interface <*interface*> **state**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*interface*>	Specifies an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **show spanning-tree interface ?** for a complete list of valid interfaces.
active	Optional. Displays information for an active interface.
active detail	Optional. Displays detailed spanning-tree protocol information for an active interface.
cost	Optional. Displays only spanning-tree protocol path cost information.
edgeport	Optional. Displays information for all interfaces configured as edgeports.
inconsistency	Optional. Displays information for all interfaces with port inconsistencies.
priority	Optional. Displays only spanning-tree protocol priority information.
rootcost	Optional. Displays only spanning-tree protocol root path cost information.
state	Optional. Displays only spanning-tree protocol state information.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R10.10.0	Command was expanded to include the **inconsistency** parameter.
Release R11.7.0	Command was expanded to include the 10 gigabit switchport interface.

Usage Examples

The following is sample output from the **show spanning-tree interface ethernet** command:

```
>enable
#show spanning-tree interface ethernet 0/2
Interface          Role               Sts              Cost       Prio. Nbr.  Type
------------------ ------------------ ---------------- ---------- ----------- ---------------
eth 0/2            Desg               LIS               19         128.2       P2p
```

show spanning-tree pathcost method

Use the **show spanning-tree pathcost method** command to display the default pathcost method being used.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show spanning-tree pathcost method** command. In this case, 32-bit values are being used when calculating path costs:

```
>enable
#show spanning-tree pathcost method
Spanning tree default pathcost method used is long
```

show spanning-tree root

Use the **show spanning-tree root** command to display information regarding the spanning-tree protocol root. Variations of this command include:

show spanning-tree root
show spanning-tree root address
show spanning-tree root cost
show spanning-tree root detail
show spanning-tree root forward-time
show spanning-tree root hello-time
show spanning-tree root id
show spanning-tree root max-age
show spanning-tree root port
show spanning-tree root priority
show spanning-tree root priority system-id

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

address	Optional. Displays the address of the spanning-tree root.
cost	Optional. Displays the path cost of the spanning-tree root.
detail	Optional. Displays the spanning-tree root information in detail.
forward-time	Optional. Displays the forward-time of the spanning-tree root.
hello-time	Optional. Displays the hello-time of the spanning-tree root.
id	Optional. Displays the ID of the spanning-tree root.
max-age	Optional. Displays the maximum age of the spanning-tree root.
port	Optional. Displays the port of the spanning-tree root.
priority	Optional. Displays the priority of the spanning-tree root.
priority system-id	Optional. Displays the priority and system-id of the spanning-tree root.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show spanning-tree root** command:

```
>enable
#show spanning-tree root
Root ID                 Root Cost   Hello Time  Max Age    Fwd Dly     Root Port
----------------------  ----------  ----------  ---------  ----------  ----------------
8191 00:a0:c8:b9:bb:82  108         2           20         15          eth 0/1
```

show srtp media sessions

Use the **show srtp media sessions** command to display media sessions that were negotiated to use Secure Realtime Transfer Protocol (SRTP) and to display key information about the SRTP session.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example displays information about SRTP media sessions:

```
>enable
#show srtp media sessions
-----------   ---- ----   -----   ------------------------
     |   SRTP | SRTCP |
   Call ID | Auth Encr | Encr  | Crypto
-----------   ---- ----   -----   ------------------------
        1       Yes  Yes    Yes     AES_CM_128_HMAC_SHA1_80
   Anchored: 10.19.247.5:10000
   Remote:   10.100.254.4:19888

        1   Yes  Yes    Yes     AES_CM_128_HMAC_SHA1_80
   Anchored: [::]:10002
   Remote:   127.0.0.1:10002

        1   Yes  Yes    Yes     AES_CM_128_HMAC_SHA1_80
   Anchored: 10.19.247.5:10001
   Remote:   10.100.254.4:19889

There are 3 active media sessions.
```

show ssh port-forward

Use the **show ssh port-forward** command to display a summary of secure shell (SSH) port forward information.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.4.0	Command was introduced.

Usage Examples

The following is sample output from the **show ssh port-forward** command:

```
>enable
#show ssh port-forward
Local Port: 22
URL of Remote User: AOS@10.23.153.22:5037
Status: Waiting for Connection
```

> *If the port forward has an active connection, the status will display as **Forwarding** instead of **Waiting for Connection**.*

show ssh-server

Use the **show ssh-server** command to display the system's public key for secure shell (SSH) connections. Variations of this command include:

show ssh-server detail
show ssh-server key-hash
show ssh-server key-hash rsa-sha2-512
show ssh-server mypubkey <*SSH public key fingerprint*>
show ssh-server mypubkey fingerprint <*fingerprint of SSH server public key*>
show ssh-server mypubkey fingerprint md5
show ssh-server mypubkey fingerprint sha1
show ssh-server mypubkey fingerprint sha2

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Displays the configured SSH server security parameters used for established SSH connections.
key-hash	Displays the SSH server public key hash of a given key string in SHA1 Digital Signature Standard (DSS) format.
rsa-sha2-512	Displays the SSH server public key hash of a given key-string in SHA-2 format.
mypubkey	Specifies displaying the SSH server public key.
fingerprint md5	Specifies displaying the MD5 fingerprint of SSH server public key.
fingerprint sha1	Specifies displaying the SHA1 fingerprint of SSH server public key.
fingerprint sha2	Specifies displaying the SHA2 fingerprint of SSH server public key.

Default Values

No default values are necessary for this command.

Command History

Release R14.4.0	Command was expanded to include rsa-sha2-512, fingerprint sha2.

Usage Examples

The following is sample output from the **show ssh-server** command:

>**enable**
#show ssh-server mypubkey
---- BEGIN SSH2 PUBLIC KEY ----
Comment: Adtran DSA Public key
AAAAB3NzaC1kc3MAAACBAKZf6qtRHGHjPfOP3drwO1m28l4fpN5X5c8ArkeKhV3a

JEmGGt87P3JxicCjAAAAgAajR0ptcBY1jOye/kO8soQz/Dv2FqO4tW/yjFaV0E1J
v+vyAMUKUgocqebciS9RofjRTZ7W153z6JIpoFRnpOC+ynIVrBRUD+/1BgqJTI6G
0VtKm6A/K+qSaSd6dhKOAAWA1C0zsJDSkhKqYwRa1ziNC7TUFHIj/n1OvIo1PdzC
---- END SSH2 PUBLIC KEY ----

The following is sample output from the **show ssh-server** command:

>**enable**
#show ssh-server mypubkey fingerprint md5

DSA Hash: 9e:50:3c:8c:a2:7b:c7:8a:75:36:ce:78:8c:6c:bd:bb

RSA Hash: b3:c8:b4:07:72:f1:70:1b:a1:90:3e:6d:2a:6c:02:b2

ECDSA NISTP256 Hash: 62:0f:bd:98:77:3c:0e:1e:1a:37:a8:9a:2b:31:73:0c

ECDSA NISTP384 Hash: 27:3e:3d:3b:c0:63:71:2b:7b:fd:6b:43:ca:67:e0:bc

ECDSA NIST521 Hash: 55:a5:65:53:b1:f5:a3:3e:3b:0f:cf:fe:3f:18:39:1c

show ssh-client

Use the **show ssh-client** command to display the system's public key for secure shell (SSH) connections. Variations of this command include:

show ssh-client detail | <begin/exclude/include>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Displays the configured SSH server security parameters used for established SSH connections.

Default Values

No default values are necessary for this command.

Command History

Release R10.10.0	Command was introduced.
Release R13.12.0	Command was expanded to include the **detail** parameter.

Usage Examples

The following example displays the configuration of the show ssh-client command:

```
>enable

#show ssh-client detail | <text>

Server IP - 10.49.228.61
Client IP - 10.49.121.2
Client version string : SSH-2.0-libssh2_1.9.0
Negotiated kex algorithm : diffie-hellman-group14-sha1
Negotiated host key format: ssh-rsa
Negotiated encryption algorithm (client to server) : aes128-crt
```

Negotiated encryption algorithm (server to client) : aes128-crt
Negotiated MAC algorithm (client to server) : hmac-sha2-256
Negotiated MAC algorithm (server to client) : hmac-sha2-256
Negotiated compression algorithm (client to server) : None
Negotiated compression algorithm (server to client) : None
SSH authentication method : password

show stack

Use the **show stack** command to view the status of all the switches configured for stacking. Displays the mode of the switch as either master or member. If the mode is master, this command also gives the status of the stack members. Variations of this command include:

show stack
show stack candidates
show stack candidates realtime
show stack realtime
show stack topology
show stack topology realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

candidates	Optional. Displays all units that have registered with this stack master. This option is only available on a switch configured as a stack master.
topology	Optional. Displays the stack topology. This option is only available on a switch configured as a stack master.
realtime	Optional. Displays full-screen output in real time. Refer to *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

The stack candidates are a list of units that could be added to the stack. They are not yet members.

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays the configuration of the switch stack while in stack-master mode:

```
>enable
#show stack
Stack mode is MASTER
 Management Vlan is 2386, firmware version is 08.00.18.D
 Stack network is 169.254.0.0/24

Stack members...
Member   Mac Address          Mgmt IP Address   Source Interface   State
2        00:A0:C8:02:CF:C0    169.254.0.2       Stack port         Up
3        00:A0:C8:00:8C:20    169.254.0.3       Stack port         Up
#
```

Member	Specifies the stack member's Unit ID.
Mac Address	Specifies the stack member's medium access control (MAC) address.
Mgmt IP Address	Specifies the stack member's IP address.
Source Interface	Specifies the interface that the stack member was learned from.
State	Specifies the stack member’s state: **Up** (member is up and functioning properly); **Down** (member was at one time functioning, but contact has been lost); **Waiting** (waiting for the unit to register; when registered, it will be added to the stack); **Denied** (the unit could not be added to the stack because the stack protocol versions were not compatible).

The following example displays the configuration of the switch stack while in stack-member mode:

```
>enable
#show stack
Stack mode is STACK-MEMBER
 My Unit ID is 3, management Vlan is 2386
 Stack management network is 169.254.0.0/24
Stack Master info:
 Master is “Switch”, learned via giga-eth 0/1
 IP address is 169.254.0.1, MAC address is 00:DE:AD:00:65:83
#
```

The following example displays all units that have registered with this stack-master:

>**enable**
#show stack candidates
Displaying all known Stack candidates...

MAC Address	System Name	Source Interface	AOS Revision
00:A0:C8:00:8C:20	LabSwitch1	stack port	08.00.18
00:A0:C8:00:F5:6C	LabSwitch2	stack port	08.00.19.D
00:A0:C8:02:CF:C0	LabSwitch3	stack port	08.00.20.D

#

show startup-config

Use the **show startup-config** command to display a text printout of the startup configuration file stored in nonvolatile random access memory (NVRAM). Variations of this command include:

show startup-config
show startup-config checksum

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

checksum	Optional. Displays the message digest 5 (MD5) checksum of the unit's startup configuration.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

This command is used in conjunction with the **show running-config checksum** command to determine whether the configuration has changed since the last time it was saved.

Usage Examples

The following is sample output from the **show startup-config** command:

```
>enable
#show startup-config
!
!
no enable password
!
ip subnet-zero
ip classless
ip routing
!
```

```
event-history on
no logging forwarding
logging forwarding priority-level info
no logging email
!

 shutdown
!
interface dds 1/1
 shutdown
!
interface bri 1/2
 shutdown
!
!
ip access-list standard MatchAll
 permit host 10.3.50.6
 permit 10.200.5.0 0.0.0.255
!
!
ip access-list extended UnTrusted
 deny   icmp 10.5.60.0 0.0.0.255 any source-quench
 deny   tcp any any
!
no snmp agent
!
!
!
```

show storm-control interfaces *<interface>*

Use the **show storm-control interfaces** to display configuration parameters and current statistics for all interfaces configured with storm control. Variations of this command include the following:

show storm-control interfaces *<interface>* **broadcast burst**
show storm-control interfaces *<interface>* **broadcast rate**
show storm-control interfaces *<interface>* **multicast-unknown burst**
show storm-control interfaces *<interface>* **multicast-unknown rate**
show storm-control interfaces *<interface>* **unicast-unknown burst**
show storm-control interfaces *<interface>* **unicast-unknown rate**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<interface>	Specifies which interface information to display. Specify an interface in the format *<interface type [slot/port]>*. For example, for a Gigabit switchport interface, enter **gigabit-switchport 0/3**, or for a 10 Gigabit switchport enter **xgigabit-switchport 1/1**. Type **show storm-control interfaces ?** for a complete list of valid interfaces.
broadcast burst	Displays the configured burst rate for broadcast traffic.
broadcast rate	Displays the configured storm control rate for broadcast traffic.
multicast-unknown burst	Displays the configured burst rate for unknown multicast traffic.
multicast-unknown rate	Displays the configured storm control rate for unknown multicast traffic.
unicast-unknown burst	Displays the configured burst rate for unknown unicast traffic.
unicast-unknown rate	Displays the configured storm control rate for unknown unicast traffic.

Default Values

No default values are necessary for this command.

Command History

Release R11.8.0	Command was introduced.

Usage Examples

The following example displays storm control broadcast rate information for **gigabit-switchport 0/3**:

>**enable**
#show storm-control interfaces gigabit switchport 0/3 broadcast rate

show switchports

Use the **show switchports** command to display switchport information. Variations of this command include:

show switchports
show switchports vlans

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

vlans	Optional. Displays the switchport vlan membership.

Default Values

No default values are necessary for this command.

Command History

Release 17.5	Command was introduced.

Usage Examples

The following is sample output from the **show switchports** command:

```
>enable
#show switchports
Name: swx 0/1
Switchport: enabled
Administrative Mode: access
Negotiation of Trunking: access
Access Mode VLAN (configured): 1
Trunking Native Mode VLAN: 1
Trunking VLAN Enabled: 1-4094
Trunking VLAN GVRP Fixed: none
Port Expiration: disabled
Port Security: disabled
Protected: false
```

Name: swx 0/2
Switchport: enabled
Administrative Mode: access
Negotiation of Trunking: access
Access Mode VLAN (configured): 1
Trunking Native Mode VLAN: 1
Trunking VLAN Enabled: 1-4094
Trunking VLAN GVRP Fixed: none
Port Expiration: disabled
Port Security: disabled
Protected: false

show system

The **show system** command shows the system version, timing source, power source, and alarm relay status.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R12.1.0	Command output was modified for virtual AOS (vAOS) instances.

Functional Notes

In vAOS instances, the output of this command does not include checksum information, boot ROM or hardware versions, or boot system images names.

Usage Examples

The following is sample output from the **show system** command:

```
>enable
#show system
Adtran, Inc. OS version 07.00.20
 Checksum: 3B2FCC0F, built on Tue Jun 01 13:36:36 2004
Boot ROM version 07.00.20
 Checksum: 604D, built on: Tue Jun 01 13:59:11 2004
Copyright (c) 1999-2004, Adtran, Inc.
Platform: Total Access 900
Serial number TechPub
Flash: 8388608 bytes DRAM: 33554431 bytes
ICP uptime is 0 days, 0 hours, 53 minutes, 50 seconds
System returned to ROM by External Hard Reset
Current system image file is “070020.biz”
```

Boot system image file is “070020.biz”
Power Source: AC
Primary System clock source config: t1 0/1
Secondary System clock source config: t1 0/1
Active System clock source: t1 0/1

show system-control-evc

Use the **show system-control-evc** command to display configuration information for the system control Ethernet virtual connection (EVC). Variations of this command include:

show system-control-evc
show system-control-evc performance-statistics 15-minute
show system-control-evc performance-statistics 15-minute *<interval>*
show system-control-evc performance-statistics 24-hour
show system-control-evc performance-statistics 24-hour *<interval>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

performance-statistics	Optional. Displays performance statistics for the system control EVC.
15-minute	Displays cumulative performance statistics for the last 15 minutes.
24-hour	Displays cumulative performance statistics for the last 24 hours.
<interval>	Optional. Limits output to a range of historical intervals. Valid range is **1** to **96**.

Default Values

No default values necessary.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display configuration information for the system control EVC:

```
>enable
#show system-control-evc
System Control EVC
    S-TAG          : --
    Admin State    : Disabled
    EVC Status     : Connection not configured
    IP             : 0.0.0.0
    Subnet         : 255.255.255.255
    Connections    : None
```

System Control EVC Ethernet Info:
    0 packets input, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts input
    0 unknown protocol, 0 discards
    0 input errors
    0 packets output, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts output

show system-management-evc

Use the **show system-management-evc** command to display configuration information for the system management Ethernet virtual connection (EVC). Variations of this command include:

show system-management-evc
show system-management-evc performance-statistics 15-minute
show system-management-evc performance-statistics 15-minute *<interval>*
show system-management-evc performance-statistics 24-hour
show system-management-evc performance-statistics 24-hour *<interval>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

performance-statistics	Optional. Displays performance statistics for the system management EVC.
15-minute	Displays cumulative performance statistics for the last 15 minutes.
24-hour	Displays cumulative performance statistics for the last 24 hours.
<interval>	Optional. Limits output to a range of historical intervals. Valid range is **1** to **96**.

Default Values

No default values necessary.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

Enter the command as follows to display configuration information for the system management EVC:

```
>enable
#show system-management-evc
System Management EVC
    S-TAG          : --
    Admin State    : Disabled
    EVC Status     : SHUTDOWN
    IP             : 0.0.0.0
    Subnet         : 255.255.255.255
    Connections    : None
```

System Management EVC Ethernet Info:
    0 packets input, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts input
    0 unknown protocol, 0 discards
    0 input errors
    0 packets output, 0 bytes
    0 unicasts, 0 broadcasts, 0 multicasts output

show system mtu

Use the **show system mtu** command to display the current system maximum transmission unit (MTU) setting.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 17.6	Command was introduced.

Usage Examples

The following is sample output from the **show system mtu** command:

```
>enable
#show system mtu

MTU size is 9216 bytes
```

show tacacs+ statistics

Use the **show tacacs+ statistics** command to display terminal access controller access control system (TACACS+) client statistics.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show tacacs+ statistics** command:

```
>enable
#show tacacs+ statistics
```

	Authentication	Authorization	Accounting
Packets sent:	0	0	0
Invalid responses:	0	0	0
Timeouts:	0	0	0
Average delay:	0ms	0ms	0ms
Maximum delay:	0ms	0ms	0ms
Socket Opens:	0		
Socket Closes:	0		
Socket Aborts:	0		
Socket Errors:	0		
Socket Timeouts:	0		
Socket Failed Connections:	0		
Socket Packets Sent:	0		
Socket Packets Received:	0		

show tcp info

Use the **show tcp info** command to display Transmission Control Protocol (TCP) control block information in AOS. This information is for troubleshooting and debug purposes only. For more detailed information, you can optionally specify a particular TCP control block. When a particular TCP control block is specified, the system provides additional information regarding crypto map settings that the **show tcp info** command does not display. Variations of this command include:

show tcp info
show tcp info realtime
show tcp info *<control block>*
show tcp info *<control block>* **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<control block>	Optional. Specifies a particular TCP control block for more detailed information.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show tcp info** command:

>**enable**
#show tcp info
TCP TCB Entries

ID	STATE	LSTATE	OSTATE	TYPE	FLAGS	RPORT	LPORT	SWIN	SRT	INTERFACE
0	FREE	FREE	FREE	SRVR	0	0	0	0	0	NONE
1	LISTEN	FREE	FREE	CONN	0	0	21	0	0	NONE
2	LISTEN	FREE	FREE	CONN	0	0	80	0	0	NONE
3	LISTEN	FREE	FREE	CONN	0	0	23	0	0	NONE
4	LISTEN	FREE	FREE	CONN	0	0	5761	0	0	NONE
5	FREE	FREE	FREE	SRVR	0	0	0	0	0	NONE

--MORE--

show tech

Use the **show tech** command to save technical information to a file named showtech.txt.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R12.1.0	Command output was modified for virtual AOS (vAOS) instances.

Functional Notes

The **show tech** command runs a script that creates a **showtech.txt** file in flash memory that contains the command output from the following show commands:

*Not all listed **show** commands apply to all Adtran products.*

show version
show modules
show flash
show cflash
show running-config verbose
show interfaces
show atm pvc
show dial-backup interfaces
show frame-relay lmi
show frame-relay pvc
show ip bgp neighbors

show ip bgp summary
show ip ospf neighbor
show ip ospf summary-address
show ip mroute
show ip bridge
show spanning-tree
show ip interfaces
show connections
show arp
show ip traffic
show tcp info
show ip protocols
show ip route
show ip access-lists
show event-history
show output-startup
show processes cpu
show buffers
show buffers users
show memory heap
show debugging

Usage Examples

The following example creates a **showtech.txt** file and displays it to the terminal screen:

>**enable**
#show tech
Opening and applying file.....
Done.

show temperature

Use the **show temperature** command to display the unit temperature.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 7.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show temperature** command:

```
>enable
#show temperature

Temperature: 33 degrees C
```

show thresholds

Use the **show thresholds** command to display thresholds currently crossed for all DS1 interfaces.

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show thresholds** command.

```
>enable
#show thresholds
t1 1/1:
    SEFS 15 min threshold exceeded
    UAS 15 min threshold exceeded
    SEFS 24 hr threshold exceeded
    UAS 24 hr threshold exceeded
t1 1/2:
    No thresholds exceeded
```

show timing-domain

Use the **show timing-domain** command to display the system timing domains.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A5.01	Command was introduced.

Usage Examples

The following is sample output from the **show timing-domain** command:

```
>enable
#show timing-domain
Timing Domain Source Config Table
Domain          Interface       Config      Source      Status
    1           t1 0/1          Primary     Line        Alarm
    1           t1 0/2          None        System      Available
    2           t1 0/3          None        System      Available
    2           t1 0/4          Primary     Line        Alarm
Timing Domain System Config Table
Domain:  1      Active Source:  System
         Primary Interface      Source      Status
         t1 0/1                 t1 0/1      Alarm
         Secondary Interface    Source      Status
Domain:  2      Active Source:  System
         Primary Interface      Source      Status
          t1 0/4                t1 0/4      Alarm
         Secondary Interface    Source      Status
```

show tls profile

Use the **show tls profile** command to display the content of configured Transport Layer Security (TLS) profiles on the AOS device. Variations of this command include:

show tls profile
show tls profile <*name*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*name*>	Optional. Limits output to a single TLS profile.

Default Values

No default values necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example displays the content of the configured TLS profile **TLS_PROFILE1**:

```
>enable
#show tls profile TLS_PROFILE1
    Name: TLS_PROFILE1
    tls-version: 1.2
    authentication: server
    ca-profile:PROFILE1
    allow-self-signed-cert: no
    Identities Validated:
    ip-address
    fqdn configured
    Ciphersuite list:
    TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
    TLS_DHE_RSA_WITH_AES_256_CBC_SHA
    TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384
    TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384
    TLS_RSA_WITH_AES_256_CBC_SHA
    TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
```

TLS_RSA_WITH_3DES_EDE_CBC_SHA
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
TLS_DHE_RSA_WITH_AES_128_CBC_SHA
TLS_RSA_WITH_AES_128_CBC_SHA
SSL_DES_192_EDE3_CBC_WITH_MD5

show tls sessions

Use the **show tls sessions** command to display information about each active Transport Layer Security (TLS) session.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example displays TLS session information:

```
>enable
#show tls sessions
    Application: SIP
    Version: TLS v1.2
    Ciphersuite: AES256-SHA
    Session ID: kKnKqvAM70IkGRBxzVHdVb8F8vkHpsL28A3D89xDGjA=
    Role: Client-only
    Local: 192.0.2.243:10459
    Peer: 198.51.100.4:5061
    Peer Certificate:
      Subject: CN = voip.example.com
      SAN IP Address:  2001:DB8:64FE::4 198.51.100.4  (Validated)
      SAN FQDN: ipv6.voip.example.com ipv4.ents.adtran.com voip.example.com  (Validated)

    There are 1 active TLS sessions.
```

show tls statistics

Use the **show tls statistics** command to display a summary of statistics for Transport Layer Security (TLS) configurations.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values necessary for this command.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example displays a statistical summary for TLS configurations:

```
>enable
#show tls statistics
    TLS Connection Requests
    Total:2
    Passed:2
    Failed:0
    TLS Handshake
    Passed:2
    Failed:0
    TLS Connections
    Dropped:0
      Closed:1
```

show toneservices resources

Use the **show toneservices resources** command to display digital signal processor (DSP) tone information.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show toneservices resources** command:

```
>enable
#show toneservices resources

DSP  Channel  Type  Port  Status
-------------------------------------------------------------
 0/1   1      RTP   N/A   Available
 0/1   2      RTP   N/A   Available
 0/1   3      RTP   N/A   Available
 0/1   4      RTP   N/A   Available
 0/1   5      RTP   N/A   Available
 0/1   6      RTP   N/A   Available
 0/1   7      RTP   N/A   Available
 0/1   8      RTP   N/A   Available
 0/1   9      RTP   N/A   Available
 0/1   10     RTP   N/A   Available
 0/1   11     RTP   N/A   Available
 0/1   12     RTP   N/A   Available
 0/1   13     RTP   N/A   Available
```

show track

Use the **show track** command to display track object configuration and statistics. Refer to *Network Monitor Track Command Set on page 4098* for information on configuring track objects. Variations of this command include the following:

show track
show track <*name*>
show track <*name*> **realtime**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

> *Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*name*>	Optional. Displays information only for the track object specified.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show track** command:

```
>enable
#show track track_1
Current State: PASS
    Dampening Interval: 30 seconds
    Test Value: probe_A (PASS) AND probe_B (FAIL)
    Track Changes: 3
    Time in current state: 25 days 2 hours, 34 minutes, 32 seconds
```

show udp info

Use the **show udp info** command to display User Datagram Protocol (UDP) session information. Variations of this command include:

show udp info
show udp info realtime
show udp info <*number*>
show udp info <*number*> **realtime**

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

> *Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

<*number*>	Optional. Specifies ID of session to display. Valid range is **0** to **31**.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 9.3	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example shows sample output from the **show udp info** command:

>**enable**
#show udp info
UDP Session Entries

ID	Local Port	IP Address	Socket
2	520	0.0.0.0	1
3	0	0.0.0.0	4
4	161	0.0.0.0	5
5	8	127.0.0.1	7
6	10	0.0.0.0	11
7	6	127.0.0.1	16
8	4	127.0.0.1	17
9	14	127.0.0.1	18
10	12	127.0.0.1	19

show usbdrive0

Use the **show usbdrive0** command to display a list of all files currently stored in Universal Serial Bus (USB) flash drive memory. Variations of this command include:

show usbdrive0
show usbdrive0 *<filename>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<filename>	Optional. Displays details for a specified file located in USB flash drive memory. Enter a wildcard (such as ***.biz**) to display the details for all files matching the entered pattern.

Default Values

No default values are necessary for this command.

Command History

Release 18.2	Command was introduced.

Usage Examples

The following is sample output from the **show usbdrive0** command:

```
>enable
#show usbdrive0
Files:
 245669 010100boot.biz
1141553 new.biz
    821 startup-config
   1638 startup-config.old
1175679 020016.biz
    821 startup-config.bak
2572304 bytes used, 4129776 available, 6702080 total
```

show usb attached-devices

Use the **show usb attached-devices** command to display statistics for universal serial bus (USB) devices attached to the USB wireless wide area network (WWAN) network interface module (NIM) or the USB port on the AOS unit. The output from this command includes the attached device identification, the product identification, the device class, the device manufacturer and model, and the slot and port used by the device. Variations of this command include:

show usb attached-devices

show usb attached-devices detail

The NetVanta USB WWAN NIM supports cellular connections through a USB cellular modem provided by the service provider. For more information about configuring the NetVanta USB WWAN NIM or the cellular interface, refer to Cellular Interface Command Set on page 2105 or the USB WWAN NIM and the Cellular Interface configuration guide available online at https://supportcommunity.adtran.com.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

detail	Displays all available device statistics.

Default Values

No default values are necessary for this command.

Command History

Release 17.8	Command was introduced.
Release 18.2	Command was expanded to include the **detail** parameter.

Functional Notes

The output of the **show usb attached-devices** commands is device-dependent, and some USB LTE modems may not respond with any output.

Usage Examples

The following is sample output from the **show usb attached-devices** command:

>**enable**
#show usb attached-devices
USB Device attached
VendorID: 1410
ProductID: 6000
DeviceClass: 0x2 (Communications)
Manufacturer: Novatel Wireless Inc.
Product: Novatel Wireless CDMA
Serial Number: 091138075581000
Slot/Port: 1/1
Number of Endpoints: 13
Endpoints: 1 INTERRUPT IN, 2 BULK IN, 2 BULK OUT, 4 BULK IN, 4 BULK OUT, 9 BULK IN, 9 BULK OUT, 10 BULK IN, 10 BULK OUT, 5 BULK IN, 6 BULK OUT, 7 BULK IN, 8 BULK OUT

The following is sample output from the **show usb attached-devices** command if an unknown device is attached to the 3G USB NIM:

>**enable**
#show usb attached-devices
USB Device attached
VendorID: 1457
ProductID: 1544
DeviceClass: 0x7 (Printer)
Manufacturer: Unknown
Product: Unknown
Serial Number: Unknown
Slot/Port: 1/1
Number of Endpoints: 0
Endpoints:

The following is sample output from the **show usb attached-devices** command if no USB device is attached to the 3G USB NIM:

>**enable**
#show usb attached-devices
No USB Device attached

show users

Use the **show users** command to display the name (if any) and state of users authenticated by the system. Variations of this command include:

show users
show users realtime

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

> *Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Displayed information includes:

- Connection location (for remote connections, this includes Transmission Control Protocol (TCP) information)
- User name of authenticated user
- Current state of the login (in process or logged in)
- Current enabled state
- Time the user has been idle on the connection

Usage Examples

The following is sample output from the **show users** command:

```
>enable
#show users
- CONSOLE 0 'adtran' logged in and enabled
 Idle for 00:00:00
- TELNET 0 (172.22.12.60:3998) 'password-only' logged in (not enabled)
 Idle for 00:00:14
- FTP (172.22.12.60:3999) 'adtran' logged in (not enabled)
 Idle for 00:00:03
```

show version

Use the **show version** command to display the current Adtran Operating System (AOS) version information.

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R12.1.0	Command output was modified for virtual AOS (vAOS) instances.

Functional Notes

In vAOS instances, the output of this command does not include checksum information, boot ROM or hardware versions, or boot system images names.

Usage Examples

The following is sample output from the **show version** command:

```
>enable
#show version

Adtran, Inc. OS version A5.01.00.E
  Mainline Version: M04
  Checksum: 894C9C39
  Built on: Fri Sep 09 11:31:09 2011
  Upgrade key: 29be9733e227e21d8f7d4af849dc7603
Hardware version C.1
Boot ROM version A3.01.00
  Checksum: 6A26
```

Built on: Wed Jul 08 16:52:15 2009
Copyright (c) 1999-2009, Adtran, Inc.
Platform: Netvanta 6334, part number 17006334G1, CLEI code is N/A
Serial number LBADTN0940AD077
Flash: 67108864 bytes DRAM: 134217727 bytes

show vlan

Use the **show vlan** command to display current virtual local area network (VLAN) information. Variations of this command include:

show vlan
show vlan brief
show vlan brief realtime
show vlan id <*vlan id*>
show vlan id <*vlan id*> **realtime**
show vlan name <*name*>
show vlan name <*name*> **realtime**
show vlan realtime

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

brief	Optional. Shows an abbreviated version of the VLAN information (brief description).
id <*vlan id*>	Optional. Shows information regarding a specific VLAN, specified by a VLAN interface ID (valid range: **1** to **4094**).
name <*name*>	Optional. Shows information regarding a specific VLAN, specified by a VLAN interface name (up to 32 characters).
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 10.1	The **realtime** display parameter was introduced.
Release 15.1	The **realtime** display parameter was added to **show vlan id** and **show vlan name**.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following is sample output from the **show vlan** command:

```
>enable
#show vlan
```

VLAN	Name	Status	Ports
- 1	Default	active	eth 0/5, eth 0/6, eth 0/8, eth 0/13, eth 0/14, eth 0/15, eth 0/16, eth 0/17, eth 0/18, eth 0/19, eth 0/20, eth 0/21, eth 0/22, eth 0/23, eth 0/24, giga-eth 0/1, giga-eth 0/2
2	accounting	active	eth 0/1, eth 0/2
3	VLAN0003	active	eth 0/3, eth 0/4, eth 0/7, eth 0/9, eth 0/10, eth 0/11, eth 0/12

VLAN	Type	MTU
- 1	enet	1500
2	enet	1500
3		

The following is an example of the **show vlan name** command that displays VLAN 2 (**accounting** VLAN) information:

```
>enable
#show vlan name accounting
VLAN              Name            Status      Ports
----------------- --------------- ----------- ---------------
- 2                accounting      active      eth 0/1, eth 0/2

VLAN              Type            MTU
----------------- --------------- -----------
- 2                enet            1500
```

show voice alias

Use the **show voice alias** command to display alias parameters. Aliases are used to mask identity settings, such as names and extensions. Variations of this command include:

show voice alias
show voice alias global
show voice alias group
show voice alias system
show voice alias user

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

global	Optional. Displays global aliases.
group	Optional. Displays group aliases.
system	Optional. Displays system aliases.
user	Optional. Displays user aliases.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show voice alias** command:

```
>enable
#show voice alias

Alias           Translation     Type
--------------- --------------- ------------------
MyAlias         4433            Global

Total Displayed: 1
```

show voice available

Use the **show voice available** command to list foreign exchange station (FXS) ports that are not associated with a user.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays FXS ports that are not associated with a user:

```
>enable
#show voice available

Interface
-------------
fxs 0/1
fxs 0/2
```

show voice conference local

Use the **show voice conference local** command to view current conference sessions. Variations of this command include:

show voice conference local all
show voice conference local session <*number*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

all	Displays current status of all local conference sessions.
session <*number*>	Displays current status of the specified local conference session.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Usage Examples

The following example displays information about all local active conference sessions:

>enable
#show voice conference local all

ID	Originator (FXS)	Remote1	Remote2	RtpRsrc
1	2001 (0/1)	T01 (2565551234)	T02 (2568675309)	0/1.(1,2,3)
2	2004 (0/4)	2002 (FXS 0/2)	3001 (SIP)	0/2.(1,4,5)

The following example only displays information for local conference session 2:

>enable
#show voice conference local session 2

ID	Originator (FXS)	Remote1	Remote2	RtpRsrc
2	2004 (0/4)	2002 (FXS 0/2)	3001 (SIP)	0/2.(1,4,5)

show voice dial-plan

Use the **show voice dial-plan** command to view number display templates. Variations of this command include:

show voice dial-plan
show voice dial-plan *<number>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<number>	Optional. Displays information about a specific number display template.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays information about number display template **1**:

```
>enable
#show voice dial-plan 1
Type                    ID      Pattern
-------------------------------------------------------------------
Always Permitted        1       NXXNXXXXXX
```

show voice did

Use the **show voice did** command to display direct inward dialing (DID) information. Variations of this command include:

show voice did
show voice did groups
show voice did other
show voice did users

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

groups	Optional. Displays all DID entries for ring groups.
other	Optional. Displays all nonuser and nonring group DID entries.
users	Optional. Displays all DID entries for users.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays DID entries for ring groups:

```
>enable
#show voice did groups
```

show voice directory

Use the **show voice directory** command to display direct inward dialing (DID) information. Variations of this command include:

show voice directory
show voice directory *<name>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<name>	Optional. Specifies the name on the directory to display. Only extensions included in the specified directory will appear.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 14.1	Command was expanded.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all extensions sorted by extension number:

```
>enable
#show voice directory
Directory Name: SYSTEM
    User Name       External        Extension
    ------------------------------------------------------
    John Smith                      5006
    Jane Doe                        5005

    Directory Name: Engineering
    User Name       External        Extension
    ------------------------------------------------------
    John Doe        Yes             5551212
```

show voice door-phone

Use the **show voice door-phone** command to display the door phone account settings. A door phone is used to communicate with visitors prior to them entering an establishment.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show voice door-phone** command:

```
>enable
#show voice door-phone

First     Last     Ext      Interface     Description
-------------------------------------------------------------------------------
Front     Door     4430     virtual       Front Door of Building
```

show voice extensions

Use the **show voice extensions** command to display all of the current voice extensions and their status.

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all extensions and the status of the extension:

```
>enable
#show voice extension

AccountID       Idle/Ring/Busy    Available   DND     FWD
-------------------------------------------------------------------------------
T01             Idle              *           -       -
T06             Idle              *           -       -
T02             Idle              *           -       -
5200            Idle              *           -       -
6000            Idle              *           -       -
6001            Idle              *           -       -
6002            Idle              *           -       -
6003            Idle              *           -       -
T03             Idle              *           -       -
2               Idle              *           -       -
1234            Idle              *           -       -
```

show voice grouped-trunk

Use the **show voice grouped-trunk** command to display all voice trunk groups.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all voice trunk groups:

```
>enable
#show voice grouped-trunk

Name        Resource-Selection      Description
-------------------------------------------------------------------------
SIP         linear                  SIP trunk
DSX         linear                  DSX trunk
DXS         linear                  DXS trunk
```

show voice line

Use the **show voice line** command to display voice line stations. Variations of this command include:

show voice line
show voice line <*station*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*station*>	Optional. Displays a specific voice line station name or extension on the system base on the valid **voice line** descriptors entered into the system.

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show voice line** command:

```
>enable
#show voice line
Line: 4444
Trunk: not configured
Registered Endpoints: 0
Call State: IDLE
Active Endpoints: N/A
DSP Resource: N/A

Line: Sales
Trunk: not configured
Registered Endpoints: 0
Call state: IDLE
--MORE--
```

show voice loopback calls

Use the **show voice loopback calls** command to display the status of the loopback call(s).

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A1	Command was introduced.

Usage Examples

The following example displays all voice loopback calls:

```
>enable
#show voice loopback calls
ID   Extension    Codec  Status                          Number          Duration (hour:min:sec)
-------------------------------------------------------------------------------------------------------------------------
 1   1123                <ENDED (invalid number)    -> 8837655          :01
 2   1123                 Calling                   -> 4001             :05

 4   1123          G729   Connected                 -> 4001             :07
```

show voice mail

Use the **show voice mail** command to display voice mail information for the system or a specific user. Variations of this command include:

show voice mail
show voice mail <*number*>
show voice mail notify-schedule <*number*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*number*>	Optional. Displays voice mail information for the specified user's extension.
notify-schedule <*number*>	Optional. Displays the voice mail notification schedule for the specified user's extension.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show voice mail** command:

```
>enable
#show voice mail
                                    New   Num   Total Time   Total Time   Greeting
AccountID  VM COS                   Msg   Msg   Used        Free         Time
-------------------------------------------------------------------------------------------------------------------
1000                                -     -     00:00:00    00:00:00     00:00
2000                                -     -     00:00:00    00:00:00     00:00
2001       normal_voicemail         38    38    00:09:54    00:00:06     00:02
2002       normal_voicemail         40    40    00:09:49    00:00:11     00:02
2003       normal_voicemail         39    39    00:09:54    00:00:06     00:02
2004       normal_voicemail         35    35    00:09:55    00:00:05     00:01
```

2005	normal_voicemail	20	20	00:09:28	00:00:32	00:01
2006	normal_voicemail	41	41	00:09:54	00:00:06	00:02
2015	normal_voicemail	42	42	00:09:57	00:00:03	00:01

0		-	-	00:00:00	00:00:00	00:00

The following is sample output for the **show voice mail** <*number*> command for extension **2017**:

```
>enable
#show voice mail 2017

Voicemail information for account:?:5T
 VM Class of Service:     executive_voicemail
 Standard Greeting:       00:09          Total Voicemail Usage:   00:11:04
 Alternate Greeting:      00:10          Total Voicemail Free:    00:18:56
 Recorded Name:           00:01

Message 1 of 75
 Time/Date: 00:28:16 CST Sun Feb 07 2106
 Calling Party: UNKNOWN (UNKNOWN)
 Length: 00:00
 Status: Old
```

The following is sample output for the **show voice mail notify-schedule** <*number*> command for extension **2017**:

```
>enable
#show voice mail notify-schedule 2017

Start                End                  Email1        Email2
-------------------------------------------------------------------------------------

Mon 8:00 am          Thu 11:59 pm         Yes           ----
Fri 12:00 am         Sat 11:59 pm         ----          ----
```

show voice match

Use the **show voice match** command to display voice automatic number identification (ANI) substitution parameters. Variations of this command include:

show voice match
show voice match ani <*template*>

> 
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

match	Displays all substitution configurations.
ani <*template*>	Optional. Displays a specific ANI substitution entry.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Functional Notes

Valid characters for templates are as follows:

0 - 9	Match the exact digit(s) only
X	Match any single digit 0 through 9
N	Match any single digit 2 through 9
M	Match any single digit 1 through 8
$	Match any number string dialed
[]	Match any digit in the list within the brackets (for example, [1,4,6])
,()	Formatting characters that are ignored but allowed
-	Use within brackets to specify a range, otherwise ignored

The following are example template entries using wildcards:

1) NXX-XXXX	Match any 7-digit number beginning with 2 through 9
2) 1-NXX-NXX-XXXX	Match any number with a leading 1, then 2 through 9, then any 2 digits, then 2 through 9, then any 6 digits
3) 555-XXXX	Match any 7-digit number beginning with 555
4) XXXX$	Match any number with at least 5 digits

5) [7,8]$	Match any number beginning with 7 or 8
6) 1234	Match exactly 1234

Some template number rules:

1) All brackets must be closed with no nesting of brackets and no wildcards within the brackets.
2) All brackets can hold digits and commas, for example: [1239]; [1,2,3,9]. Commas are implied between numbers within brackets and are ignored.
3) Brackets can contain a range of numbers using a hyphen, for example: [1-39]; [1-3,9].
4) The $ wildcard is only allowed at the end of the template, for example: 91256$; XXXX$.

Usage Examples

The following example displays voice substitution information:

>**enable**
#show voice match

ani - match: 2323
substitute: 5555

show voice music-on-hold statistics

Use the **show voice music-on-hold statistics** command to display music on hold player statistics.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example displays music on hold player statistics:

```
>enable
#show voice music-on-hold statistics

MOH Player      Codec       IpAddress       Port
System          PCMU        10.17.20.38     3002        default player

MOH Player      NumRegApps  Codec           Play Status File Name
System          1           PCMU            Playing     welcome.wav

#
```

show voice named-digit-timeouts

Use the **show voice named-digit-timeouts** command to view configured named digit timeouts (NDTs) and their values. The output for this command includes the default NDT value. Variations of this command include:

show voice named-digit-timeouts
show voice named-digit-timeouts <*name*>

> NOTE
>
> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*name*>	Optional. Displays information about a specific named digit timeout.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Usage Examples

The following example displays all named digit timeouts and their timeout value:

```
>enable
#show voice named-digit-timeouts
Name                    Timeout Value (secs)
------------------------------------------------------------------------------
default                 4
long                    10
longer                  12
longest                 16
short                   6
shorter                 5
shortest                2
```

show voice operator-group

Use the **show voice operator-group** command to display all operator groups.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 14.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all operator groups:

```
>enable
#show voice operator-group
Operator-group: 0      Call distribution type: all
Number of calls allowed: 1
Number of rings before coverage: 4

Extension  Firstname            Lastname        Logged In
-------------------------------------------------------------------------------
2001           John                 Smith              *

Order       # of Rings      Call Coverage Action
-------------------------------------------------------------------
1                0              Auto Attendant
2                2                  None
3                2                  None
4                2                  None
5                2                  None
```

show voice phone-files

Use the **show voice phone-files** command to display files required for Session Initiation Protocol (SIP) phone configuration.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 12.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example shows sample output from the **show voice phone-files** command:

```
>enable
#show voice phone-files

03/02/2006 16:03 PM          216 0004f203f69c.cfg
03/02/2006 16:03 PM          687 5001-0004f203f69c.cfg
03/02/2006 16:03 PM          216 0004f203b0d6.cfg
03/14/2006 16:03 PM          306 polycom.cfg
7 File(s)          132516 bytes
0 Dir(s)           0 bytes
21019575 bytes used, 9720360 available, 30739935 total
```

show voice pickup-group

Use the **show voice pickup-group** command to display all configured call pickup groups (or a specific group). Variations of this command include:

show voice pickup-group

show voice pickup-group *<name>*

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<name>	Optional. Specifies a particular call pickup group to display.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following is sample output from the **show voice pickup-group** command:

```
(config)#show voice pickup-group
        Pickup Group: Group1
        Description: 4th floor sales
        Pickup Group Extension: 8508

        Members    Firstname      Lastname
        ---------------------------------------------
        0330          Vickie       Spinaker
        2003          Marc          Starkalous
        2013          Patrick       Wales
        2007          Drew          Lever
        2006          Sarah         Williams
        1012          Jessica       Thomas
```

show voice quality-stats

Use the **show voice quality-stats** command to display voice quality statistical information. Variations of this command include the following:

show voice quality-stats
show voice quality-stats active
show voice quality-stats active realtime
show voice quality-stats <*id*>
show voice quality-stats <*id*> **realtime**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*Using the **realtime** argument for this command can adversely affect the performance of your unit.*

Syntax Description

active	Displays all quality statistics for active calls.
<*id*>	Specifies an identity number of a call to obtain detailed statistics.
realtime	Optional. Displays full-screen output in real time. Refer to the *Functional Notes* below for more information.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Functional Notes

Use the **realtime** argument for this command to display full-screen output in real time. Information is continuously updated on the console until you either freeze the data (by pressing the **F** key) or exit **realtime** mode (by pressing **Ctrl-C**). If there is not enough room on the screen for all available data, the information will truncate at the bottom of the screen. In order to maximize the amount of data displayed, increase the terminal length (using the **terminal length** command; refer to *terminal length <number> on page 1133*).

Usage Examples

The following example displays voice quality statistics for all active calls:

>**enable**
#show voice quality-stats active

ID	Start Time	From	To	Duration	Codec	Lost Pkts	Discard Pkts	Delay Avg	Delay Max
4236	3:02 pm	5152222	5157744	6:55	G711	2	0	50	50

show voice queue

Use the **show voice queue** command to display the status of the call queuing feature. Variations of this command include:

show voice queue
show voice queue <*extension*>
show voice queue detail
show voice queue detail <*extension*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*extension*>	Optional. Specifies the extension of the call queue to display.
detail	Optional. Displays detailed call queue information.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Usage Examples

The following example displays status information for the call queue at extension **6407**:

```
>enable
#show voice queue 6407
Call Queue: 6407        Call distribution type: ring-all
Name: TSqueue
Description: Tech Support Call Queue

Max allowed number of queued calls: 16
Operation: active
State: unlocked

Current queue stats:
        Calls: 1
        Longest Wait: 30
```

24 Hour Stats:

calls queued: 87

calls Abandoned: 1 calls overflowed:

longest wait time: 30 average wait time: 13

Members	Firstname	Lastname	Logged In
2013	Patrick	Wales	*
2004	John	Taylor	*
2003	Marc	Starkalous	*#

show voice ring-group

Use the **show voice ring-group** command to display all ring groups. Variations of this command include:

show voice ring-group
show voice ring-group <*number*>

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

<*number*>	Optional. Displays information about a specific ring group extension.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all ring groups:

```
>enable
#show voice ring-group
ring-group   1234          type: linear
description:
Number of calls allowed: 1
First        Last          Ext          Logged In
-------------------------------------------------------------------------
Order        NumRings      Action
-------------------------------------------------------------------------
1            2             None
2            2             None
3            2             None
4            2             None
5            2             None
```

ring-group 2 type: linear
description:
Number of calls allowed: 1

First	Last	Ext	Logged In

Order	NumRings	Action
1	2	None
2	2	None
3	2	None

show voice speed-dial

Use the **show voice speed-dial** command to display system speed dial information. Variations of this command include:

show voice speed-dial
show voice speed-dial <*number*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<*number*>	Optional. Displays information about a specific speed dial number. Valid range is **1** to **99**.

Default Values

No default values are necessary for this command.

Command History

Release 11.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays information on speed dial number **50**:

```
>enable
#show voice speed-dial 50
speed-dial - ID: 50
    Name: Main Office
    Number: 4000
```

show voice spre

Use the **show voice spre** command to display all special prefix (SPRE) code mappings. Functions with no SPRE code assigned are not displayed. Variations of this command include:

show voice spre local
show voice spre network

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

local	Displays all SPRE codes used locally.
network	Displays all SPRE codes passed through to the network.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release A1.02	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all local SPRE codes:

```
>enable
#show voice spre local

Current SPRE Handling Mode:  Local

SPRE Code                    Description
-------------------------------------------------------------------------------------------------------
**                           Hands Free Auto-Answer

*20n                         System Mode 0=Deflt, 1=Night, 2=Lunch, 3=Wknd, 7=Override
*21xxxx                      Billing Code
*25nn                        System Speed Dial
```

*30	Page-Overhead
*31x	Page intercom (0=all, 1-9=zone)
*32	Forward Notification Cancel
*33xxxx	Call Forward + Extension
*34xxxx*pppp*nxxxxxx	Call Forward Remote
*35	Call Forward Cancel
*36xxxx*pppp*	Remote Call Forward Cancel
*37	Door Phone
*38	Door Unlock
*39x	Do Not Disturb Enable/Disable
*44	Permanent Hold
*46xxxx*pppp*	Hotel Login
47pppp	Hotel Logout
52xxxx	Pickup Extension
55xxxx	Group Login
56xxxx	Group Logout
57pppp	User Station/Phone Lock
58pppp	User Station Unlock
*61nnxxxx	Program User Speed Dial
*62nn	Call User Speed Dial
*63xxxx*pppp*	MACA Login
64pppp	MACA Logout
*65	Cancel Camp-on
*66	Camp on a Busy Extension
*67	Block Call-ID delivery for this call only
*69	Call Return
*70	Disable Call Waiting on a per call basis
*72	Call last dialed number
74xxxx	CallQueue Login
76xxxx	CallQueue Logout
*77z	Call Park + Zone
*78z	Call Park Retrieve

*98	Voicemail

show voice status-group

Use the **show voice status-group** command to display information on all voice status groups or on a specified group. Variations of this command include:

show voice status-group
show voice status-group *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

<name>	Optional. Displays all users within the specified status group.

Default Values

No default values are necessary for this command.

Command History

Release 14.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all voice status group extensions:

>enable
#show voice status-group

Status-group: Sales Team
Description:

Type	Member ID	Display Name	Status
user	2001	Martha	Idle
user	3002	Dan	Idle
user	3003	Betty	Idle
user	3004	Chris	Idle
user	4001	Jami	Idle

Number of members: 5

show voice switchboard

Use the **show voice switchboard** command to display all voice switchboard extensions.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following example displays all voice switchboard extensions:

```
>enable
#show voice switchboard
Ext
----
1234
2
5200
6000
6001
6002
6003
```

show voice system-mode

Use the **show voice system-mode** command to display the current system mode running on the unit. Specifying a day will display any transitions configured for that day. Variations of this command include:

show voice system-mode
show voice system-mode sunday
show voice system-mode monday
show voice system-mode tuesday
show voice system-mode wednesday
show voice system-mode thursday
show voice system-mode friday
show voice system-mode saturday

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

[sunday - saturday]	Optional. Displays the specified system mode programmed in the unit. Choose from Sunday through Saturday.

Default Values

No default values are valid for this command.

Command History

Release A1	Command was introduced.

Usage Examples

The following example shows sample output from the **show voice system-mode monday** command:

```
>enable
#show voice system-mode monday
Current system-mode: default
System-mode transition - Day: monday
        Mode @ time: lunch @ 12:00
        Mode @ time: default @ 13:00
        Mode @ time: night @ 17:00
```

The following is sample output from the **show voice system-mode** command:

>**enable**
#show voice system-mode
Current system-mode: weekend

show voice trunk

Use the **show voice trunk** command to display all voice trunks. Variations of this command include:

show voice trunk
show voice trunk *<trunk id>*
show voice trunk connects *<trunk id>*
show voice trunk server-cache

> *The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*
>
> *For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.*

Syntax Description

connects	Optional. Displays all trunk voice interface connections.
<trunk id>	Optional. Displays voice trunk information for a specific trunk ID. Use T01, T02, and so on for the trunk ID.
server-cache	Optional. Displays information contained in the voice trunk Session Initiation Protocol (SIP) server cache.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release R13.8.0	Command was expanded to include the **server-cache** parameter.

Usage Examples

The following example displays all voice trunks:

```
>enable
#show voice trunk
```

Trunk Name	Resource Selection	Busy Admin. Config.	Busy Admin. Status	Busy Attempts Today	Non Busy Attempts Today	Busy Attempts Total	Non Busy Attempts Total
T01	linear	Not Busy	Not Busy	0	0	0	7
T06	linear	Not Busy	No Connects	0	0	0	0
T02	linear	Not Busy	Not Busy	0	0	0	27
T03	linear	Not Busy	No Connects	0	0	0	0

show voice trunk monitor

Use the **show voice trunk monitor** command to display the configuration settings for Session Initiation Protocol (SIP) trunks used for SIP trunk failover on the AOS system. Displayed settings include any trunks configured with SIP trunk failover, any configured recovery delay, and the address, port, and status of any failover servers.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values necessary for this command.

Command History

Release R10.9.0	Command was introduced.

Usage Examples

The following example displays the configuration information for SIP trunks used in a failover situation:

```
>enable
#show voice trunk monitor
Trunk:                                  T01
Delay                                   Min 3600
Servers:
    Address                                 | Port    | Status
    111.111.111.111                         | 5060    | Up *
    222.222.222.222                         | 5060    | Down
    2001:0DB8:AC10:FE01:0000:0000:0000:0000 | 12345   | Delay   Remaining 97 s
```

show voice users

Use the **show voice users** command to display all voice user stations. Variations of this command include:

show voice users
show voice users did
show voice users extension
show voice users last
show voice users location

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

did	Optional. Displays all users included in the directory.
extension	Optional. Displays directory entries sorted by extensions.
last	Optional. Displays directory entries sorted by last name.
location	Optional. Displays the location of users in the directory.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 14.1	Command was expanded.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.03	Command was expanded to include the **location** parameter.

Usage Examples

The following example displays all voice users:

```
>enable
#show voice users
First       Last        Ext         Interface Description
----------------------------------------------------------------------------
Janet       Smith       5200        virtual
Bill        Jones       6000        virtual
Sam         Sampson     6001        virtual
```

show voice users sip

Use the **show voice users sip** command to display a list of Session Initiation Protocol (SIP) users with their associated ports.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 15.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.

Usage Examples

The following is sample output from the **show voice users sip** command:

```
>enable
#show voice users sip

First          Last         Extension      Interface MAC Address      IP Address
-------------------------------------------------------------------------------------------------------------------
Fronia         Cobins       4430           Unregistered user - Unable to resolve port
Gorge          Owens        4440           Unregistered user - Unable to resolve port
Heather        Virginia     4450           Unregistered user - Unable to resolve port

Total number of configured SIP voice users: 3
```

show voip name-service cache

Use the **show voip name-service cache** command to view Voice over Internet Protocol (VoIP) name service information stored in the cache.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A2.04	Command was introduced.

Functional Notes

The information displayed in the show command output consists of two columns. The left column lists the host name of an entry in the VoIP Name Service Name Table. This corresponds with the entries shown in the output of the command *show voip name-service name-table on page 1109*. The right column shows the corresponding last resolved IP address(es) of the entry. An IP address of all zeros indicates the particular host has not been resolved. In the event all domain naming system (DNS) servers are unreachable and a particular host name cannot be refreshed, the DNS uses the cached address to resolve the particular host.

Usage Examples

The following example displays name service information stored in the cache:

```
>enable
#show voip name-service cache

Name                                    Last Resolved Address
-------------------------------------------------------------------------------------------
test2.pprice.voice.test.adtran.com      1.2.3.3
bogus3.pprice.voice.test.adtran.com     1.2.3.3
test.pprice.voice.test.adtran.com       0.0.0.0
bogus1.pprice.voice.test.adtran.com     1.2.3.1
bogus2.pprice.voice.test.adtran.com     1.2.3.2
```

show voip name-service name-table

Use the **show voip name-service name-table** command to view Voice over Internet Protocol (VoIP) name service information in the name table.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release A2	Command was introduced.

Functional Notes

The following information is displayed in the show command output:

- **Name** - Indicates the name of the service.
- **Proto** - Indicates the protocol.
- **Tpt** - Indicates the transport method used, either User Datagram Protocol (UDP) or Transmission Control Protocol (TCP).
- **LastSrc** - Indicates the last software object that requested this domain naming system (DNS) entry be cached. Valid options are **trunk**, **route**, **manual**, **proxy**, **MGCP**, or **derived**.
- **Interval** - Indicates when the entry will expire.
- **Users** - Indicates the number of software objects using this entry.
- **Resolved** - Indicates whether or not the DNS has been able to resolve this entry.

Usage Examples

The following example displays name service information in the name table:

```
>enable
#show voip name-service name-table
```

Name	Proto	Tpt	LastSrc	Interval	Users	Resolved
pq.adtran.com	SIP	UDP	trunk	0h 59m 47s	2	Yes
bw2.pq.adtran.com	SIP	UDP	trunk	0h 59m 46s	2	Yes

Technology Review

VoIP name service maintains a list of service names relevant to VoIP transactions while also facilitating access between VoIP-related queries to the external DNS server and the internal DNS client. Service names are automatically entered and deleted from the internal service name table when configured or not configured for VoIP-related subsystems. The VoIP name service begins polling external DNS servers for recently added service names to preemptively resolve service names before they are deleted. Using the **show voip name-service name-table** command will show the status of added service names.

show voipwizard log

Use the **show voipwizard log** command to display the log file from the Voice over IP (VoIP) Setup Wizard.

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release R11.3.0	Command was introduced.

Usage Examples

The following example displays the VoIP Setup Wizard log file:

```
>enable
#show voipwizard log
VCID: 1 (NV1638)
Using 19358 bytes

********** SUMMARY *************
Ports successfully assigned as voice ports: (switchport 0/1-24)
Ports successfully assigned as uplink ports: (gigabit-switchport 0/1-4)

Voice port configuration: description voice
                          spanning-tree edgeport
                          no shutdown
                          switchport voice vlan 2
                          qos trust cos
Uplink port configuration: description uplink
                           no shutdown
                           switchport mode trunk
                           qos trust cos

--MORE--
```

show vrf

Use the **show vrf** command to display the configured virtual routing and forwardings (VRFs) and the interfaces associated with each one (or a specific VRF). Variations of this command include:

show vrf
show vrf *<name>*
show vrf interfaces
show vrf interfaces *<name>*

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

*To view secondary IP addresses, use the **show running-config** command.*

Syntax Description

<name>	Optional. Displays information for only the specified VRF.
interfaces	Optional. Displays information about interfaces associated with all configured VRFs.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release 17.8	The keyword **ip** was removed from this command.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **show vrf** command:

```
>enable
#show vrf
Name            Default RD      Interfaces
-Default-       0:0             eth 0/1
                                ppp 1
Engineering     100:1           vlan 11
                                vlan 12
Accounting      100:2           vlan 21
                                vlan 22
```

The following is sample output from the **show vrf interfaces** command:

```
>enable
#show vrf interfaces
Interface       IP Address      VRF             Protocol
eth 0/1         10.0.0.1                        DOWN
ppp 1           10.0.1.1                        UP
vlan 11         1.1.1.1         Engineering     UP
vlan 12         1.1.2.1         Engineering     UP
vlan 21         2.1.1.1         Accounting      UP
```

show vrrp

Use the **show vrrp** command to display configuration and operating data for Virtual Router Redundancy Protocol (VRRP) configurations. Variations of this command include:

show vrrp
show vrrp brief
show vrrp interface <*interface*>
show vrrp interface <*interface*> **group** <*number*>
show vrrp statistics
show vrrp statistics interface <*interface*>
show vrrp statistics interface <*interface*> **group** <*number*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

brief	Optional. Limits the amount of data shown.
group <*number*>	Optional. Displays data or statistics for a specified VRRP group on the specified interface. Group numbers range from **1** to **255**.
interface <*interface*>	Optional. Displays data or statistics for all VRRP groups or a specified group on the specified interface. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a virtual local area network (VLAN) interface, use **vlan 1**. Type **show vrrp interface ?** for a complete list of valid interfaces.
statistics	Optional. Displays statistics for all VRRP groups on all interfaces.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the modifiers **begin**, **exclude**, and **include**.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface and the gigabit switchport interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

Although VRRP group virtual router identifiers (VRIDs) can be numbered between 1 and 255, only two VRRP routers per interface are supported.

Usage Examples

The following example gives sample output from the **show vrrp statistics** command:

```
eth 0/1
Group 1
    Became Master: 3
    Priority Zero Packets Sent: 1
    Priority Zero Packets Received: 0
    Advertisements Sent: 105134
    Advertisements Received: 241
        Advertisements Interval Errors: 0
        Advertisements TTL Errors: 0
        Advertisements Address List Errors: 0
        Advertisements Packet Length Errors: 0
Group 2
    Became Master: 1
    Priority Zero Packets Sent: 0
    Priority Zero Packets Received: 0
    Advertisements Sent: 897
    Advertisements Received: 1628
        Advertisements Interval Errors: 0
        Advertisements TTL Errors: 0
        Advertisements Address List Errors: 0
        Advertisements Packet Length Errors: 0
```

show vrrpv3

Use the **show vrrpv3** command to display configuration and operating data for Virtual Router Redundancy Protocol version 3 (VRRPv3) configurations. Variations of this command include:

show vrrpv3
show vrrpv3 brief
show vrrpv3 interface <*interface*>
show vrrpv3 interface <*interface*> **group** <*vrid*>
show vrrpv3 interface <*interface*> **group** <*vrid*> **ipv4**
show vrrpv3 interface <*interface*> **group** <*vrid*> **ipv6**
show vrrpv3 statistics
show vrrpv3 statistics interface <*interface*>
show vrrpv3 statistics interface <*interface*> **group** <*vrid*>
show vrrpv3 statistics interface <*interface*> **group** <*vrid*> **ipv4**
show vrrpv3 statistics interface <*interface*> **group** <*vrid*> **ipv6**

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

brief	Optional. Limits the amount of data displayed.
interface <*interface*>	Optional. Displays data or statistics for all VRRPv3 groups or a specified group on the specified interface. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a virtual local area network (VLAN) interface, use **vlan 1**. Type **show vrrp interface ?** for a complete list of valid interfaces.
group <*vrid*>	Optional. Displays data or statistics for a specified VRRPv3 group virtual router IDs (VRIDs) on the specified interface. Group VRIDs range from **1** to **255**.
ipv4	Optional. Displays data or statistics for the VRRPv3 group's IPv4 address family.
ipv6	Optional. Displays data or statistics for the VRRPv3 group's IPv6 address family.
statistics	Optional. Displays statistics for all VRRPv3 groups on all interfaces.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.
Release R10.11.0	Command was expanded to include the **ipv4** and **ipv6** parameters.

Functional Notes

Although VRRPv3 group VRIDs can be numbered between 1 and 255, only two VRRPv3 routers per interface per IP version are supported.

Usage Examples

The following example gives sample output from the **show vrrpv3** command:

```
>enable
#show vrrpv3
eth 0/1
  Group 1 - Address-Family IPv6
    State: Master
    Administrative state: UP
    Description:
    Configured Priority: 100, Actual Priority: 100
    Number of Addresses: 1
    Virtual Link-Local Address: FE80::7890
    Virtual Global Address: 00:00:5E:00:02:01
    Virtual MAC Address: 00:00:5E:00:02:01
    Accept-Mode is enabled
    Advertisement interval: 1 second(s)
    Preemption: Enabled - delay 0 second(s)
    Last Transition: 0:00:00:02
    Master Router Address: FE80::2A0:C8FF:FE23:21E0 (local) Priority: 100
```

show vxlan

Use the **show vxlan** command to display information regarding virtual extensible local area network (VxLAN) configuration on your AOS product. Variations of this command include:

show vxlan host
show vxlan host tunnel <*interface id*>
show vxlan host vni <*number*>
show vxlan peers
show vxlan peers tunnel <*interface id*>
show vxlan vni
show vxlan vni tunnel <*interface id*>

*The output of all **show** commands can be limited by appending the following modifiers to the end of the command: | **begin** <text>, | **exclude** <text>, and | **include** <text>. The **include** modifier limits output to lines that contain the specified text, the **exclude** modifier excludes any lines with the specified text, and the **begin** modifier displays the first line of output with the specified text and all lines thereafter.*

For specific instructions and examples regarding these modifiers, refer to the introduction of the Enable Mode Command Set on page 94.

Syntax Description

host	Displays information, sorted by tunnel ID, for active VxLAN tunnels on this device.
host tunnel <*interface id*>	Optional. Displays VxLAN information for the specified tunnel interface. Valid tunnel range is **1** to **1024**.
host vni <*number*>	Optional. Displays VxLAN information for the specified VNI. Valid VNI range is **1** to **677215**.
peers	Displays information, sorted by tunnel ID, for all VxLAN peers connected to this device.
peers tunnel <*interface id*>	Optional. Displays information for the VxLAN peer connected to the specified tunnel interface. Valid tunnel range is **1** to **1024**.
vni	Displays information, sorted by VNI, for all active VxLAN tunnels.
vni tunnel <*interface id*>	Optional. Displays VxLAN information, sorted by VNI, for the specified tunnel interface.Valid VNI range is **1** to **1024**.

Default Values

No default values are necessary for this command.

Command History

Release 13.1.0	Command was introduced.

Usage Examples

The following is sample output from the **show vxlan** command:

```
>enable
#show vxlan host vni 100
DestnationMac       TunnelId    VniId    DestinationVtep    Type          TTL(Sec)

00:11:22:33:44:AD   1           100      10.0.2.15          DYNAMIC       1477

>enable
#show vxlan peers
Tunnel ID       Source IP       Destination IP       Dest port       MTU
 1              10.0.2.17       10.0.2.15            4789            1464

>enable
#show vxlan vni tunnel 1
Source interface    Vlan-id    VNI        Tunnel
eth 0/2.1           2          100        tunnel 1
```

sip check-sync

Use the **sip check-sync** command to send a check-sync notification to all IP phones registered to the unit. When an IP phone receives this check-sync notification, the phone will check for possible configuration changes stored on the server. Variations of this command include the following:

sip check-sync
sip check-sync firmware-upgrade
sip check-sync *<user name or ip address>*

Syntax Description

firmware-upgrade	Optional. Specifies a check-sync to be used when upgrading phone firmware.
<user name or ip address>	Optional. Specifies the phone to contact with configuration changes.

Default Values

No default values are necessary for this command.

Command History

Release 13.1	Command was introduced.

Usage Examples

The following example notifies all IP phones to check for a change in configuration:

>**enable**
#sip check-sync

ssh <*url*>

Use the **ssh** <*url*> command to create a secure shell (SSH) client connection between the AOS unit and another device. Variations of this command include:

ssh <*url*>
ssh <*url*>**myprivkey**
ssh <*url*>**myprivkey** <private key for SSH authentication>
ssh <*url*> **myprivkey dsa**
ssh <*url*> **myprivkey ecdsa256**
ssh <*url*> **myprivkey ecdsa384**
ssh <*url*> **myprivkey ecdsa512**
ssh <*url*> **myprivkey rsa**
ssh <*url*> **myprivkey rsa-sha2-512**
ssh <url> **port** <*port*>
ssh <*url*> **port** <port number> **myprivkey** <private key for SSH authentication>
ssh <*url*> **port** <port number> **myprivkey dsa**
ssh <*url*> **port** <port number> **myprivkey ecdsa256**
ssh <*url*> **port** <port number> **myprivkey ecdsa384**
ssh <*url*> **port** <port number> **myprivkey ecdsa512**
ssh <*url*> **port** <port number> **myprivkey rsa**
ssh <*url*> **port** <port number> **myprivkey rsa-sha2-512**
ssh <*url*> **privkey** <*filename of private key file*>
ssh <*url*> **source-interface** <*interface*>
ssh <*url*> **source-interface bvi** <*bridged virtual interface number*>
ssh <*url*> **source-interface gigabit-interface** <*gigabit interface slot/port*>
ssh <*url*> **source-interface loopback** <*loopback interface number: 1-1024*>
ssh <*url*> **source-interface ppp** <*PPP interface number*>
ssh <*url*> **source-interface tunnel** <*Tunnel interface number: 1-1024*>

Syntax Description

<*url*>	Specifies the uniform resource locator (URL) of the far end device. The format of the URL string must be **user@**<***ip address*** | ***hostname***>, for example, **MGARCIA@10.10.10.1** or **MGARCIA@domain.com**. IPv4 and IPv6 addresses as well as hostnames are supported in the URL definition. Optionally, you may include a password for the SSH connection using the format **user:password@**<***ip address*** | ***hostname***>, for example, **MGARCIA:password@10.10.10.1**.
myprivkey	Optional: This is a private key for SSH authentication. Available solutions are: **dsa**, **ecdsa256**, **ecdsa384**, **ecdsa521**, **rsa**, and **rsa-sha2-512**.
privkey	Optional. Filename of the private key file (PEM format).

port <*port*>	Optional. Specifies a port to use for connecting with the remote device instead of the default SSH port 22. Valid range is **1** to **65535**. Interface is optional. Valid values are: **myprivkey**, **privkey** and **source-interface**.
source-interface <*interface*>	Optional. Specifies the interface to be used as the source IP address for the SSH connection. Specify an interface in the format <*interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; and for an ATM subinterface, use **atm 1.1**. Type **ssh** <*url*> **source-interface** for a complete list of valid interfaces. Options are: Bridged virtual interface <*BVI number*> gigabit-ethernet <*slot/port*> loopback interface number <*1-1024*> tunnel interface <*1-1024*>

Default Values

When SSH client connections are created, by default they use port **22** and the default VRF.

Command History

Release R12.2.0	Command was introduced.
Release R14.4.0	Command was expanded to include myprivkey dsa, rsa, rsa-sha2-512, ecdsa256, ecdsa384, and ecdsa521 parameters.

Functional Notes

If you do not specify a password when using this command, you will be prompted for a password from the far end machine after entering the command.

Usage Examples

The following example creates an SSH client connection for the user **MGARCIA** on a target host of **10.10.10.1**, using the default SSH port:

```
>enable
#ssh MGARCIA@10.10.10.1
```

The following example creates an SSH client connection for the user **MGARCIA** on a target host of **10.10.10.1**, using **myprivkey** with source-interface **dsa.**

```
>enable
#ssh MGARCIA@10.10.10.1 myprivkey dsa
```

ssh key regenerate

Use the **ssh key regenerate** command to generate a new digital signature algorithm (DSA) or Rivest-Shamir-Adleman (RSA) and Elliptic Curve Digital Signature Algorithm (ECDSA) key pair for SSH connections. When a new key file is generated, it erases the old key file. Variations of this command include:

ssh key regenerate
ssh key regenerate <*key*>
ssh key regenerate dsa
ssh key regenerate ecdsa
ssh key regenerate ecdsa <*key length*>
ssh key regenerate ecdsa 256
ssh key regenerate ecdsa 384
ssh key regenerate ecdsa 521
ssh key regenerate rsa <*key length*>
ssh key regenerate rsa 2048
ssh key regenerate rsa 3072
ssh key regenerate rsa 4096
ssh key regenerate sftp <*key*>
ssh key regenerate sftp dsa
ssh key regenerate sftp ecdsa <*key length*>
ssh key regenerate sftp ecdsa 256
ssh key regenerate sftp ecdsa 384
ssh key regenerate sftp ecdsa 521
ssh key regenerate sftp rsa <*key length*>
ssh key regenerate sftp rsa 2048
ssh key regenerate sftp sa 3072
ssh key regenerate sftp rsa 4096

Syntax Description

dsa	Optional. Limits the generation to only SFTP DSA keys.
ecdsa <*input*>	Optional. Limits the generation to only SFTP ECDSA keys. Supported ECDSA Key length are: 256, 384 and 521.
rsa <*input*>	Optional. Limits the generation to only RSA keys. Supported Key lengths are: 2048, 3072 and 4096.
sftp <*input*>	Optional. Limits the generation to only SFTP, DSA, RSA, and ECDSA key types.
dsa <*key length*>	Optional. Limits the generation to only SFTP DSA keys.
ecdsa <*key length*>	Optional. Limits the generation to only SFTP ECDSA keys. Supported key lengths are 256, 384. and 521.
rsa <*key length*>	Optional. Limits the generation to only SFTP RSA keys. Supported key lengths are 2048, 3072 and 4096.

Default Values

By default, a key file is generated when the system boots for the first time.

Command History

Release 10.10.0	Command was introduced.
Release R12.2.0	Command was expanded to include the **dsa** and **rsa** parameters, as well as support for RSA keys.
Release 13.11.0	Command was expanded to include the **sftp**, **sftp dsa,** and **sftp rsa** parameters, as well as support for SFTP keys.
Release 14.3.0	Command was expanded to include **rsa** (3072 and 4096), **ecdsa** (256, 384 and 521) keys for SSH and SFTP connections.

Functional Notes

When the **ssh key regenerate** command is entered without the optional **dsa**, **rsa,** or **sftp** keywords, by default, all key types are regenerated.

Usage Examples

The following example generates a new **dsa** key file for SSH connections:

>enable
#ssh key regenerate dsa

The following example generates a new **ecdsa** with a key length of **256**:
>enable
#ssh key regenerate ecdsa 256

The following example generates a new **sftp** for **rsa** with a key length of **4096.**
>enable
#ssh key regenerate sftp rsa 4096

ssh port-forward

Use the **ssh port-forward** command to create a secure shell (SSH) tunnel between the AOS unit and another device. Variations of this command include:

ssh port-forward <*port-forward port*> <*url*>
ssh port-forward <*port-forward port*> <*url*> **myprivkey dsa**
ssh port-forward <*port-forward port*> <*url*> **password** <*password*>
ssh port-forward <*port-forward port*> <*url*> **port** <*port*>
ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **myprivkey dsa**
ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **password** <*password*>
ssh port-forward <*port-forward port*> <*url*> **port** <*port*> **privkey** <*filename*>
ssh port-forward <*port-forward port*> <*url*> **privkey** <*filename*>

The maximum number of simultaneous port forward sessions is 10. However, this number could be reduced if there are not enough TCP resources due to other applications using them.

Syntax Description

<*port-forward port*>	Specifies the forwarded port on the local unit.
<*url*>	Specifies the uniform resource locator (URL) of the far end listening address. The format of the URL string must be **user@server:remote-port**, for example, MGARCIA@10.10.10.1:7000. Optionally, you may include the IP address of an interface on the remote machine using the format **user@server:remote-port:FarEndListenAddress**, for example, MGARCIA@10.10.10.1:7000:10.10.10.2. If a far end listen address is not included as part of the URL, localhost is assumed, and only those users logged into the remote machine can use the tunnel.
myprivkey dsa	Optional. Specifies to use the AOS unit's digital signature algorithm (DSA) private key for SSH authentication.
password <*password*>	Optional. Specifies a password to use for SSH authentication.
port <*port*>	Optional. Specifies a port to use for the underlying SSH protocol instead of the default SSH port 22. Valid range is **1** to **65535**.
privkey <*filename*>	Optional. Specifies a private key file to use for SSH authentication.

Default Values

No default values are necessary for this command.

Command History

Release 11.4.0	Command was introduced.

Functional Notes

Port forwarding via SSH is a technology that uses a secure tunnel between a local computer and a remote computer in order to relay data from other services. Because the tunnel is secure, it can be used to forward data from services that are inherently insecure. Port forwards on AOS devices support the following applications: Hypertext Transfer Protocol (HTTP), Hypertext Transfer Protocol Secure (HTTPS), SSH, and Telnet.

To use this feature, your network must allow encrypted outbound sessions to be created through your firewall. Most firewalls allow encrypted outbound sessions by default.

If you do not specify a password when using this command, you will be prompted for a password for the far end machine after entering the command.

Usage Examples

The following example creates a port forward (between the AOS device and machine 10.10.10.1) using port **22** as the local forwarded port **7000** as the forward port on **10.10.10.1**. The user name on the remote machine is **MGARCIA**, and the password is **PASSWORD**

>**enable**
#ssh port-forward 7000 MGARCIA@10.10.10.1 password PASSWORD

ssh vrf

Use the **ssh vrf** command to create a secure shell (SSH) tunnel between the AOS unit and another device. Variations of this command include:

ssh vrf <*vrfName*><*url*><*interface*>
ssh vrf <*vrfName*><*url*>**myprivkey**
ssh vrf <*vrfName*><*url*>**myprivkey**
ssh vrf <*vrfName*><*url*>**myprivkey**<*private key for SSH authentication*>
ssh vrf <*vrfName*><*url*>**myprivkey** dsa
ssh vrf <*vrfName*><*url*>**myprivkey** ecdsa256
ssh vrf <*vrfName*><*url*>**myprivkey** ecdsa384
ssh vrf <*vrfName*><*url*>**myprivkey** ecdsa521
ssh vrf <*vrfName*><*url*>**myprivkey** rsa
ssh vrf <*vrfName*><*url*>**myprivkey** rsa-sha2-512
ssh vrf <*vrfName*><*url*>**port** <*port number: 1-65535*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> <*SSH authentication*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey** <*key for SSH authentication*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey dsa**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey ecdsa256**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey ecdsa384**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey ecdsa521**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey rsa**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **myprivkey rsa-sha2-512**
ssh vrf <*vrfName*><*url*>**port** <*port number*> **privkey** <*private key file name*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **source-interface** <*interface*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **source-interface bvi** <*Bridged virtual interface number*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **source-interface gigabit-ethernet** <*Gigabit Ethernet interface slot/port*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **source-interface ppp** <*PPP interface number*>
ssh vrf <*vrfName*><*url*>**port** <*port number*> **source-interface tunnel** <*Tunnel interface number: 1-1024*>

Syntax Description

vrf	Specifies the name of the virtual routing and forwarding (VRF) network device.
<url>	Specifies the uniform resource locator (URL) of the far end listening address. The format of the URL string must be **user@server:remote-port**, for example, MGARCIA@10.10.10.1:7000. Optionally, you may include the IP address of an interface on the remote machine using the format **user@server:remote-port:FarEndListenAddress**, for example, MGARCIA@10.10.10.1:7000:10.10.10.2. If a far end listen address is not included as part of the URL, localhost is assumed and only those users logged into the remote machine can use the tunnel.

myprivkey	Optional. Specifies to use the AOS unit's DSA, RSA, rsa-sha512, ecdsa256, ecdsa384, and ecdsa521 private key for key SSH authentication.
port <*port*>	Optional. Specifies a port to use for the underlying SSH protocol instead of the default SSH port 22. Valid range is **1** to **65535**.
privkey <*filename*>	Optional. Specifies a private key file to use for SSH authentication.
Source-interface	Specifies the source interface. Specify an interface for the SSH connection.

Default Values

No default values are necessary for this command.

Command History

Release R12.2.0	Command was introduced.
Release 14.4.0	Command was expanded to include **myprivkey**, **dsa**, **rsa**, **ecdsa256**, **ecdsa384**, and **ecdsa521** key type options.

Functional Notes

If you do not specify a password when using this command, you will be prompted for a password from the far end machine after entering the command.

Usage Examples

The following example creates the SSH VRF (between the AOS device and machine 10.10.10.1) using port **22** as the local forwarded port. The VRF file name is TEST and user name is **MARCIA** on the remote machine **Adtran@10.10.10.1** with a **myprivkey** value is ecdsa256.

>**enable**
#ssh vrf TEST MARCIA@Adtran10.10.10.1
#ssh vrf TEST MARCIA@Adtran10.10.10.1 myprivkey
#ssh vrf TEST MARCIA@Adtran10.10.10.1myprivkey ecdsa256

The following example creates a SSH VRF (between the AOS device and machine 10.10.10.1) using port **22** as the local forwarded port and a **myprivkey** value is **dsa**.

#ssh vrf TEST MARCIA@Adtran10.10.10.1 port 22 myprivkey dsa

The following example creates a SSH VRF (between the AOS device and machine 10.10.10.1) using port **22** as the local forwarded port and a **source-interface** of **bvi**.

#ssh vrf TEST MARCIA@Adtran10.10.10.1 port 22 source-interface bvi

telnet

Use the **telnet** command to open a Telnet session (through AOS) to another system on the network. Variations of this command include the following:

telnet <*ip address* | *hostname*>
telnet <*ip address* | *hostname*> **port** <*tcp port*>
telnet vrf <*name*> <*ip address* | *hostname*>
telnet vrf <*name*> <*ip address* | *hostname*> **port** <*tcp port*>

Syntax Description

<*ip address* | *hostname*>	Specifies the IP address or host name of the remote system. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
port <*tcp port*>	Optional. Specifies the Transmission Control Protocol (TCP) port number to be used when connecting to a host through Telnet. Range is **1** to **65535**.
vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) where the IP address or host name exists.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 14.1	Command was expanded to specify the port number.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example opens a Telnet session with a remote system (**10.200.4.15**):

>**enable**
#telnet 10.200.4.15
User Access Login:
Password:

The following example opens a Telnet session with a remote system (**10.200.4.15**) on port **8010**:

>**enable**
#telnet 10.200.4.15 port 8010
User Access Login:
Password:

telnet stack-member <*unit id*>

Use the **telnet stack-member** command to Telnet to a stack member.

Syntax Description

<*unit id*>	Specifies unit ID of the stack member to connect via a Telnet session.

Default Values

No default values are necessary for this command.

Command History

Release 8.1	Command was introduced.

Functional Notes

This command is only available when in stack-master mode.

Usage Examples

The following example Telnets to a member of the stack:

>enable
#telnet stack-member 3
Trying Stack Member 3...Press Ctrl+C to abort

telnet vrf <*name*> stack-member <*number*>

Use the **telnet vrf stack-member** command to open a Telnet session (through AOS) with a member of the stack.

Syntax Description

vrf <*name*>	Specifies the virtual routing and forwarding (VRF) where the stack member exists.
stack-member <*number*>	Specifies which member of the stack to which to Telnet.

Default Values

No default values are necessary for this command.

Command History

Release 16.1	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example opens a Telnet session with stack member **3** of the VRF **red**:

>**enable**
#telnet vrf red stack-member 3
Trying Stack Member 3...Press Ctrl+C to abort

terminal length *<number>*

The **terminal length** command sets the number of rows (lines) for a terminal session. Use the **no** form of this command to return to the default value. This command is only valid for the current session and returns to the default (24 rows) when the session closes.

Syntax Description

<number>	Specifies the number of rows for a terminal session. Range is **0** to **480** lines. Setting the **terminal length** to 0 disables paging.

Default Values

The default setting for this command is **24** rows.

Command History

Release 6.1	Command was introduced.

Usage Examples

The following example sets the number of rows for a terminal session to **30**.

```
>enable
#terminal length 30
```

test cable-diagnostics

Use the **test cable-diagnostics** command to generate a report concerning various cabling states and issues related to the physical condition of an Ethernet cable connected to the specified port. Variations of this command include:

test cable-diagnostics switchport <*slot/port*>
test cable-diagnostics gigabit-switchport <*slot/port*>

Running a cable diagnostics test will disrupt traffic on the port being tested.

Syntax Description

switchport <*slot/port*>	Specifies that the cable diagnostics test be run on the indicated 10/100 Mbps switchport.
gigabit-switchport <*slot/port*>	Specifies that the cable diagnostics test be run on the indicated 10/100/1000 Mbps gigabit switchport.

Default Values

No default values are necessary for this command.

Command History

Release R10.7.0	Command was introduced.

Usage Examples

The following example runs a cable diagnostics test on switchport **0/1**:

#test cable-diagnostics switchport 0/1

traceroute

Use the **traceroute** command to display the Internet Protocol version 4 (IPv4) routes a packet takes to reach the specified destination. Variations of this command include:

traceroute
traceroute [ip] <*ipv4 address* | *hostname*>
traceroute [ip] <*ipv4 address* | *hostname*> <*interface*>
traceroute [ip] <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*>
traceroute [ip] <*ipv4 address* | *hostname*> **system-control-evc**
traceroute [ip] <*ipv4 address* | *hostname*> **system-management-evc**
traceroute [ip] <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
traceroute [ip] <*ipv4 address* | *hostname*> <*interface*> **source** <*ipv4 address*>
traceroute [ip] <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*> <*ipv4 address*>
traceroute [ip] <*ipv4 address* | *hostname*> **system-control-evc source** <*ipv4 address*>
traceroute [ip] <*ipv4 address* | *hostname*> **system-management-evc source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-control-evc**
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-management-evc**
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> <*interface*> **source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **mef-ethernet** <*slot/port*> <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-control-evc source** <*ipv4 address*>
traceroute [ip] vrf <*name*> <*ipv4 address* | *hostname*> **system-management-evc source** <*ipv4 address*>

Syntax Description

ip	Optional. Specifies an IPv4 trace.
<*interface*>	Optional. Specifies the egress interface to use for the trace. Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **traceroute** <*ipv4 address* | *hostname*> **?** to display a list of valid interfaces.
mef-ethernet <*slot/port*>	Optional. Specifies the Metro Ethernet Forum (MEF) Ethernet interface is used for the trace.
system-control-evc	Optional. Specifies the system control Ethernet virtual connection (EVC) is used for the trace.
system-management-evc	Optional. Specifies the system management EVC is used for the trace.
<*ipv4 address* | *hostname*>	Optional. Specifies the IPv4 address or host name of the remote system's route to trace.
source <*ipv4 address*>	Optional. Specifies the IPv4 address of the interface to use as the source of the trace. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

vrf <*name*>	Optional. Specifies the virtual routing and forwarding (VRF) where the route exists.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command was expanded to include the <*interface*> and **ip** parameters.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

The **traceroute** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **traceroute** command:

```
>enable
#traceroute 192.168.0.1
Type CTRL+C to abort.
Tracing route to 192.168.0.1 over a maximum of 30 hops
  1   22ms   20ms   20ms    192.168.0.65
  2   23ms   20ms   20ms    192.168.0.1
```

traceroute ethernet

Use the **traceroute ethernet** command to initiate a linktrace message from one Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance endpoint (MEP) to another MEP. These linktrace messages are used to trace the packet route to a destination MEP. Variations of this command include:

traceroute ethernet <*target-mac-address* | *target-mep-id*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **domain** <*domain name*> **association** <*association name*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **domain none association** <*association name*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **fdb-only**
traceroute ethernet <*target-mac-address* | *target-mep-id*> **interface** <*interface*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **mep** <*mep id*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **sorted**
traceroute ethernet <*target-mac-address* | *target-mep-id*> **timeout** <*timeout*>
traceroute ethernet <*target-mac-address* | *target-mep-id*> **ttl** <*value*>

After specifying the target for the linktrace messages, the other parameters can be entered in any order.

Syntax Description

<*target-mac-address* | *target-mep-id*>	Specifies the destination for the linktrace message. Medium access control (MAC) addresses are entered in the format **HH:HH:HH:HH:HH:HH**. Target MEP IDs are the unique numerical values identifying MEPs. MEP IDs range from **1** to **8191**.
domain <*domain name*>	Optional. Specifies the maintenance domain to which the transmitting MEP belongs.
domain none	Optional. Specifies no maintenance domain.
association <*association name*>	Optional. Specifies the maintenance association to which the transmitting MEP belongs.
fdb-only	Optional. Specifies that the maintenance points on the route only use their forwarding database, and not their continuity check message (CCM) database when deciding if/how to forward linktrace messages.
interface <*interface*>	Optional. Specifies the interface on which the transmitting MEP is configured. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**. For a list of appropriate interfaces, enter **interface ?** at the prompt.

mep <*mep id*>	Optional. Specifies the MEP ID of the transmitting MEP. MEP ID range is **1** to **8191**.
sorted	Optional. Specifies the traceroute utility waits until all traceroute results have been received and sorted by hop count before displaying them.
timeout <*timeout*>	Optional. Specifies the time that the MEP will wait for a response to the linktrace message. Range is **0** to **60** seconds.
ttl <*value*>	Optional. Specifies the time to live (TTL) field of the linktrace message. Range is **0** to **255**.

Default Values

By default, the **timeout** value is set to **5** seconds.

By default, the **ttl** value is set to **5** seconds.

Command History

Release 17.4	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Metro Ethernet interface and the gigabit switchport interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.

Functional Notes

The **traceroute ethernet** command can be issued from both the Basic and Enable modes.

If the MEP ID is used as the target, the remote MEP must exist in the MEP CCM database (meaning the remote MEP is transmitting valid CCMs) so that the MEP ID can be translated to the MAC address before the linktrace message is transmitted.

Both the **domain** <*domain name*> and **association** <*association name*> parameters are not required if the source MEP ID of the MEP is specified and unique through the AOS device.

If the domain and association of the transmitting MEP are specified, and there is only one MEP in that domain or association, or if there is only one MEP configured on the unit, the **mep** <*mep id*> parameter is not required.

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example initiates the Ethernet traceroute utility from a MEP with the ID **1** to an MEP with an MEP ID of **201**:

>**enable**
#traceroute ethernet 201 mep 1

```
Type CTRL+C to abort.

TTL 255. LTM Timeout is 5 seconds
Tracing route to        MEPID 201 (00:10:94:00:00:06)
                from    MEPID 1
                in      Domain_1/MA_1
MD Level 7, vlan 0
Traceroute sent via interface eth 0/1

-------------------------------------------------------------------------------------------------------------------------------
Hops    Mac                             Flags           Ingress-Action          Relay Action
          PrevHop                                               Egress-Action
-------------------------------------------------------------------------------------------------------------------------------
1       00:10:94:00:00:00               Forwarded       InNoTLV                 RLY_MPDB
            00:A0:C8:16:96:0D                                   EgOK
3       00:10:94:00:00:05               Forwarded       InNoTLV                 RLY_MPDB
            00:10:94:00:00:04                                   EgOK
2       00:10:94:00:00:04               Forwarded       InNoTLV                 RLY_MPDB
            00:10:94:00:00:00                                   EgOK
4       00:10:94:00:00:06 (Eg)          Terminal        InNoTLV                 RLY_HIT
            00:10:94:00:00:05

Destination reached
```

Remember that linktrace can be a tree-structure, and is not always linear. The PrevHop for Hop 3 in the previous example tells you the MAC of Hop 2. This gives you a way to trace the linktrace message when a tree-structure exists. Refer to Section J.5 of IEEE 802.1ag for more information.

traceroute ipv6

Use the **traceroute ipv6** command to display the IPv6 nodes traversed to reach the specified destination. Variations of this command include:

traceroute ipv6 <*ipv6 address*>
traceroute ipv6 <*ipv6 address*> <*interface*>
traceroute ipv6 <*ipv6 address*> **mef-ethernet** <*slot/port*>
traceroute ipv6 <*ipv6 address*> **system-control-evc**
traceroute ipv6 <*ipv6 address*> **system-management-evc**
traceroute ipv6 <*ipv6 address*> <*interface*> **source** <*ipv6 address*>
traceroute ipv6 <*ipv6 address*> **mef-ethernet** <*slot/port*> <*ipv6 address*>
traceroute ipv6 <*ipv6 address*> **system-control-evc source** <*ipv6 address*>
traceroute ipv6 <*ipv6 address*> **system-management-evc source** <*ipv6 address*>
traceroute ipv6 <*ipv6 address*> **source** <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> <*interface*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **mef-ethernet** <*slot/port*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **system-control-evc**
traceroute ipv6 vrf <*name*> <*ipv6 address*> **system-management-evc**
traceroute ipv6 vrf <*name*> <*ipv6 address*> <*interface*> **source** <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **mef-ethernet** <*slot/port*> **source** <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **system-control-evc source** <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **system-management-evc source** <*ipv6 address*>
traceroute ipv6 vrf <*name*> <*ipv6 address*> **source** <*ipv6 address*>

Syntax Description

<*interface*>	Optional. Specifies the egress interface when tracing a route to an IPv6 link-local address (any address that has the prefix **FE80::/64**). Interfaces are specified in the <*interface type*> <*slot/port* | *interface id*> format. For example, for an Ethernet interface, use **eth 0/1**. Type **traceroute ipv6** <*ipv6 address*> **?** to display a list of valid interfaces. This variable is ignored when using a non-link-local address.
<*ipv6 address*>	Specifies the IPv6 address of the remote system's route to trace. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**. Entering the **traceroute ipv6** command using a link-local destination address prompts the user for an egress interface.
mef-ethernet <*slot/port*>	Optional. Specifies the Metro Ethernet Forum (MEF) Ethernet interface is used for the trace.
system-control-evc	Optional. Specifies the system control Ethernet virtual connection (EVC) is used for the trace.
system-management-evc	Optional. Specifies the system management EVC is used for the trace.
source <*ipv6 address*>	Optional. Specifies the IPv6 address to use as the source address in the probing packets. The source IPv6 address must be a valid address local to the router on the specified virtual routing and forwarding (VRF) instance.

vrf <*name*>	Optional. Specifies the VRF where the IPv6 address exists.

Default Values

No default values are necessary for this command.

Command History

Release 18.1	Command was introduced.
Release R10.5.0	Command was expanded to include the loopback interface.
Release R10.10.0	Command was expanded to include the **system-control-evc** and **system-management-evc** parameters.
Release R10.11.0	Command was expanded to include the MEF Ethernet interface.

Functional Notes

The **traceroute ipv6** command can be issued from both the Basic and Enable modes.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS platforms supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following is sample output from the **traceroute ipv6** command:

```
>enable
#traceroute ipv6 2001:DB8:1A0::3
Tracing route to over a maximum of 30 hops
Type CTRL+C to abort.
Legend:  '!' = Success, '?' = Unknown host, '$' = Invalid host address
         '*' = Request timed out, '-' = Destination host unreachable
         'x' = TTL expired in transit, 'e' = Unknown error
         'B' = Packet too big
1     2ms      2ms      3ms      2001:DB8:0:F820::5
2     102ms    109ms    102ms    2001:DB8:1A0::3
```

undebug all

Use the **undebug all** command to disable all activated debug messages.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 2.1	Command was introduced.

Usage Examples

The following example disables all activated debug messages:

```
>enable
#undebug all
```

verify-file

Use the **verify-file** command to validate a boot image file located in a specified memory location (CompactFlash®, system flash, RAM disk, or USB flash drive). AOS initiates the validation process automatically before an image can be set as the primary boot image. This command is used as a precautionary step before erasing the primary boot image. Variations of this command include:

verify-file cflash <*filename*>
verify-file flash <*filename*>
verify-file ramdisk <*filename*>
verify-file usbdrive0 <*filename*>

*Not all units are capable of using a RAM disk file system, CompactFlash card, or Universal Serial Bus (USB) flash drive. Use the **verify-file ?** command to display a list of valid commands at the enable prompt.*

Syntax Description

<*filename*>	Specifies the name of the file to validate.
cflash	Indicates the specified file is located on the CompactFlash card.
flash	Indicates the specified file is located in the system flash memory.
ramdisk	Indicates the specified file is located in the volatile RAM disk.
usbdrive0	Indicates the specified file is located in the USB flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 17.7	Command was introduced.
Release 18.2	Command was expanded to include the **usbdrive0** parameter.
Release R12.1.0	Command version **verify-file flash** <*filename*> was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

The **verify-file flash** <*filename*> command is not available on vAOS instances.

Usage Examples

The following example validates the **NV3120A-17-05-01-00-E.biz** file (located in the volatile RAM disk) as a possible candidate for the boot system file:

>**enable**
#verify-file ramdisk NV3120A-17-05-01-00-E.biz
Valid file signature

vlan database

Use the **vlan database** command to enter the Virtual Local Area Network (VLAN) Database Configuration mode. Refer to the section *VLAN Database Command Set on page 3361* for more information.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example enters the VLAN Configuration mode:

```
>enable
#vlan database
```

voice dsp capture

Use the **voice dsp capture** command to initiate digital signal processor (DSP) captures. Use the **no** form of this command to return to the default setting. Variations of this command include:

voice dsp capture cancel
voice dsp capture start
voice dsp capture start <*value*>
voice dsp capture stop

Syntax Description

cancel	Cancels the current DSP capture and discards the captured files.
start	Starts the command line interface (CLI) wizard that prompts the user for the necessary information to initiate a DSP capture.
<*value*>	Optional. Specifies a DSP capture starting on a specific channel on DSP 0/1. The valid channel number range is **1** to **32**.
stop	Stops the current DSP capture and downloads the captured files to FLASH.

Default Values

By default, the DSP capture is disabled.

Command History

Release 15.1	Command was introduced.

Functional Notes

The voice DSP captures are used to help diagnose voice issues. The channel numbers for this command correspond to those seen in the **show** and **debug** commands (for example, the first channel is 1, not 0).

Output is received on all console sessions notifying you of a running DSP capture or download. Closing the CLI session on which the capture was started will cancel the current capture. This method of DSP capture is valid on AOS Release 15.1 or later, replacing the *en8 int voip 0/1* method.

Usage Examples

The following example starts a DSP capture:

#voice dsp capture start
DSP Slot [0]: **0**
DSP Port [1]: **1**
DSP Channel [1]:**1**
%Warning! Performance of this unit may be degraded during a DSP capture!
Continue and start DSP Capture? [y/n] **y**
DSP UTILITIES. Voice Capture A DSP capture is active on VoIP 0/1 on channel 1dsp capture

voice loopback-call

Use the **voice loopback-call** command to initiate and terminate voice loopback calls. Variations of this command include:

voice loopback-call start from <*number*> **to** <*number*>
voice loopback-call stop account <*number*>
voice loopback-call stop all
voice loopback-call stop id <*number*>

Syntax Description

start from <*number*>	Starts a loopback call from the specified extension number (loopback account).
to <*number*>	Specifies the extension number to call.
stop	Stops active loopback calls.
account <*number*>	Terminates the call(s) for the specific account.
all	Terminates all loopback calls.
id <*number*>	Terminates a specific loopback call based on the identity number of the call.

Default Values

By default, no loopback accounts are configured.

Command History

Release A1	Command was introduced.

Usage Examples

The following example starts a voice loopback call:

>**enable**
#voice loopback-call start from 5555 to 6100

wall *<message>*

Use the **wall** command to send messages to all users currently logged into the AOS unit.

Syntax Description

<message>	Sends a message to all users logged into the command line interface (CLI).

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.

Usage Examples

The following example sends the message “Reboot in 5 minutes if no objections” to the CLI screen of everyone currently connected:

>enable
#wall Reboot in 5 minutes if no objections

write

Use the **write** command to save the running configuration to the unit's nonvolatile random access memory (NVRAM) or a Trivial File Transfer Protocol (TFTP) server. Also, use the **write** command to clear NVRAM or to display the running configuration on the terminal screen. Entering the **write** command with no other arguments copies your configuration changes to the unit's NVRAM. Once the save is complete, the changes are retained even if the unit is shut down or suffers a power outage. Variations of this command include:

write
write dynvoice-config
write erase
write memory
write network
write terminal

Syntax Description

dynvoice-config	Optional. Writes dynvoice configuration information to the unit's NVRAM.
erase	Optional. Erases the configuration files saved to the unit's NVRAM.
memory	Optional. Saves the current configuration to NVRAM.
network	Optional. Saves the current configuration to the network TFTP server.
terminal	Optional. Displays the current configuration on the terminal screen.

Default Values

No default values are necessary for this command.

Command History

Release 3.1	Command was introduced.

Usage Examples

The following example saves the current configuration to the unit's NVRAM:

```
>enable
#write memory
```

GLOBAL CONFIGURATION MODE COMMAND SET

To activate the Global Configuration mode, enter the **configure terminal** command at the Enable mode prompt. For example:

```
>enable
#configure terminal
(config)#
```

The following commands are common to multiple command sets and are covered in a centralized section of this guide. For more information, refer to the sections listed below:

All other commands for this command set are described in this section in alphabetical order.

aaa accounting commands *<level>*

Use the **aaa accounting commands** command to create and define a default or named accounting method list for use with authentication, authorization, and accounting (AAA) accounting services. The accounting commands method lists specify the types of information recorded when users access specified command levels (privileged or unprivileged). Use the **no** form of this command to disable the accounting commands method list. Variations of this command include:

aaa accounting commands *<level>* **default none**
aaa accounting commands *<level>* **default stop-only group** *<name>*
aaa accounting commands *<level>* **default stop-only group tacacs+**
aaa accounting commands *<level>* *<listname>* **none**
aaa accounting commands *<level>* *<listname>* **stop-only group** *<name>*
aaa accounting commands *<level>* *<listname>* **stop-only group tacacs+**

Syntax Description

<level>	Specifies whether the method list applies to Level **1** (unprivileged) or Level **15** (privileged) commands.
<listname>	Creates and names the accounting commands method list to use rather than the default list.
default	Creates and defines the default accounting commands method list to use rather than a named list.
none	Specifies that no accounting methods are used.
stop-only	Records accounting information only when the connection terminates.
group *<name>*	Specifies using a subset of terminal access controller access-control system (TACACS+) servers for keeping accounting records. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.
group tacacs+	Specifies using all TACACS+ servers for keeping accounting records. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.

Default Values

By default, AAA accounting is disabled and no accounting command method lists are defined.

Command History

Release 11.1	Command was introduced.

Functional Notes

AAA accounting is an AAA service that helps track the services and resources that network users are accessing and using. Accounting works by sending records of user activity to a configured server that can be used by network administrators to monitor network management, client billing, and auditing. In AOS, AAA accounting can record the commands users are entering using the **aaa accounting commands** command to create method lists that monitor specified command levels.

Before AAA accounting method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA accounting method list relies on a combination of accounting methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** *<name>* method that can be entered multiple times to accommodate multiple configured server groups. When specifying methods for the AAA accounting commands method list, it is important to remember that no additional parameters are available when using the **none** option, and that **group tacacs+** or **group** *<name>* methods are not available until after specifying **stop-only**. Once you have specified **stop-only** as a method, you can specify **group tacacs+** and **group** *<name>* in any order or combination. If the unit fails to make a connection with the first group listed, it will try the next group specified.

The two types of method lists created using the **aaa accounting commands** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA accounting commands method lists are applied to line interfaces using the **accounting commands** command from the appropriate line interface configuration mode (*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to record command accounting information (TACACS+ are the only servers available for AOS AAA accounting; RADIUS servers are not supported), the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for maintaining accounting records by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for accounting, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

For more information about AAA accounting, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a list called **myList** and specifies that accounting records are generated for all Level **1** commands when the connection terminates, and that these records are received by all configured TACACS+ servers:

(config)**#aaa accounting commands 1 myList stop-only group tacacs+**

aaa accounting connection

Use the **aaa accounting connection** command to create and define a default or named accounting method list for use with authentication, authorization, and accounting (AAA) accounting services. The accounting connection method lists are used to specify the types of information recorded about outbound connections made from the AOS unit. Use the **no** form of this command to disable the accounting connection method list. Variations of this command include:

aaa accounting connection default none
aaa accounting connection default start-stop group *<name>*
aaa accounting connection default start-stop group tacacs+
aaa accounting connection default stop-only group *<name>*
aaa accounting connection default stop-only group tacacs+
aaa accounting connection *<listname>* **none**
aaa accounting connection *<listname>* **start-stop group** *<name>*
aaa accounting connection *<listname>* **start-stop group tacacs+**
aaa accounting connection *<listname>* **stop-only group** *<name>*
aaa accounting connection *<listname>* **stop-only group tacacs+**

Syntax Description

default	Creates and defines the default accounting connection method list to use rather than the named list.
<listname>	Creates and names the accounting connection method list to create and use rather than the default list.
none	Specifies that no accounting methods are used.
start-stop	Records accounting information when the connection begins and when the connection terminates.
stop-only	Records accounting information only when the connection terminates.
group *<name>*	Specifies using a subset of terminal access controller access-control system (TACACS+) servers for keeping accounting records. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.
group tacacs+	Specifies using all TACACS+ servers for keeping accounting records. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.

Default Values

By default, AAA accounting connection is disabled and no accounting connection method lists are defined.

Command History

Release 13.1	Command was introduced.

Functional Notes

AAA accounting is an AAA service that helps track the services and resources that network users are accessing and using. Accounting works by sending records of user activity to a configured server that can be used by network administrators to monitor network management, client billing, and auditing. In AOS, AAA accounting can record information about outbound connections made from the network access server using the **aaa accounting connection** command to create method lists that monitor outbound connections.

Before AAA accounting method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA accounting method list relies on a combination of accounting methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. When specifying methods for the AAA accounting connection method list, it is important to remember that no additional parameters are available when using the **none** option, and that **group tacacs+** or **group** <*name*> methods are not available until after specifying **start-stop** or **stop-only**. Once you have specified **start-stop** or **stop-only** as a method, you can specify **group tacacs+** and **group** <*name*> in any order or combination. If the unit fails to make a connection with the first group listed, it will try the next group specified.

The two types of method lists created using the **aaa accounting connection** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA accounting connection method lists are applied to line interfaces using the **accounting connection** command from the appropriate line interface configuration mode (*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to record connection accounting information (TACACS+ are the only servers available for AOS AAA accounting; RADIUS servers are not supported), the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for maintaining accounting records by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for accounting, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

For more information about AAA accounting, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a list called **myList** and sends the connection information to all TACACS+ servers when the connection terminates:

(config)**#aaa accounting connection myList stop-only group tacacs+**

The following example creates a list called **myList** and sends the connection information to the TACACS+ servers when the connection is made and when the connection terminates:

(config)**#aaa accounting connection myList start-stop group tacacs+**

aaa accounting exec

Use the **aaa accounting exec** command to create and define a default or named accounting method list for use with authentication, authorization, and accounting (AAA) accounting services. AAA executive accounting method lists are used to specify the types of information recorded about inbound connections made by connecting to the line interfaces and creating a terminal session. Use the **no** form of this command to disable the accounting exec method list. Variations of this command include:

aaa accounting exec default none
aaa accounting exec default start-stop group *<name>*
aaa accounting exec default start-stop group tacacs+
aaa accounting exec default stop-only group *<name>*
aaa accounting exec default stop-only group tacacs+
aaa accounting exec *<listname>* **none**
aaa accounting exec *<listname>* **start-stop group** *<name>*
aaa accounting exec *<listname>* **start-stop group tacacs+**
aaa accounting exec *<listname>* **stop-only group** *<name>*
aaa accounting exec *<listname>* **stop-only group tacacs+**

Syntax Description

default	Creates and defines the default accounting exec method list to use rather than the named list.
<listname>	Creates and names the accounting exec method list to use rather than the default list.
none	Specifies that no accounting methods are used.
start-stop	Records accounting information when the connection begins and when the connection terminates.
stop-only	Records accounting information only when the connection terminates.
group *<name>*	Specifies using a subset of terminal access controller access-control system (TACACS+) servers for keeping accounting records. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.
group tacacs+	Specifies using all TACACS+ servers for keeping accounting records. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.

Default Values

By default, AAA accounting exec is disabled and no accounting exec method lists are defined.

Command History

Release 13.1	Command was introduced.

Functional Notes

AAA accounting is an AAA service that helps track the services and resources that network users are accessing and using. Accounting works by sending records of user activity to a configured server that can be used by network administrators to monitor network management, client billing, and auditing. In AOS, AAA accounting can record information about inbound connections (made by connecting to the line interfaces and creating a terminal session) using the **aaa accounting exec** command to create method lists that monitor inbound connections.

Before AAA accounting method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA accounting method list relies on a combination of accounting methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. When specifying methods for the AAA accounting exec method list, it is important to remember that no additional parameters are available when using the **none** option, and that **group tacacs+** or **group** <*name*> methods are not available until after specifying **start-stop** or **stop-only**. Once you have specified **start-stop** or **stop-only** as a method, you can specify **group tacacs+** and **group** <*name*> in any order or combination. If the unit fails to make a connection with the first group listed, it will try the next group specified.

The two types of method lists created using the **aaa accounting exec** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA accounting exec method lists are applied to line interfaces using the **accounting exec** command from the appropriate line interface configuration mode(*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to record exec accounting information (TACACS+ are the only servers available for AOS AAA accounting; RADIUS servers are not supported), the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for maintaining accounting records by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for accounting, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

For more information about AAA accounting, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a list called **myList** and sends the connection/login records to the TACACS+ servers when the connection is terminated:

(config)**#aaa accounting exec myList stop-only group tacacs+**

aaa accounting suppress null-username

Use the **aaa accounting suppress null-username** command to specify that authentication, authorization, and accounting (AAA) accounting records for users with a NULL user name are not sent to the AAA accounting server.

Syntax Description

No subcommands.

Default Values

By default, records of all user accounts, including NULL user names, are sent to the server.

Command History

Release 11.1	Command was introduced.

Functional Notes

Null users are those users whose user name string is NULL. Users might have this user name if they came in on a line whose record type is **none** (typically, these are users that authenticated with a password-only login or no login).

Usage Examples

The following example specifies that users with the user name NULL are not sent to the server:

(config)**#aaa accounting suppress null-username**

aaa accounting update

Use the **aaa accounting update** command to specify how often authentication, authorization, and accounting (AAA) accounting records are sent to the accounting server(s). Use the **no** form of this command to return to the default setting. Variations of this command include:

aaa accounting update newinfo
aaa accounting update periodic <*value*>

Syntax Description

newinfo	Specifies that information is sent to the server only when there is new recorded information.
periodic <*value*>	Specifies the time interval (in minutes) between sending accounting records to the server. Interval range is **1** to **2147483647**.

Default Values

By default, accounting records are sent to the server every **5** minutes.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example specifies that accounting records are sent to the accounting server every **60** minutes:

(config)**#aaa accounting update periodic 60**

aaa authentication banner <*banner*>

Use the **aaa authentication banner** command to specify the banner shown during authentication, authorization, and accounting (AAA) login/authentication. Using the **no** form of this command returns the banner to the default message.

Syntax Description

banner <*banner*>	Sets the banner shown before user authentication is attempted. The banner can be multiple lines. Enter a delimiter (such as #) to begin recording the typed text message used for the banner. The message must end with the same delimiter to indicate that the message is complete. The text delimiters are not displayed to the screen during operation.

Default Values

By default, the authentication banner is **User Access Verification**.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example changes the authentication banner to read **User Login Authentication**:

(config)#**aaa authentication banner #**
Enter TEXT message. End with the character '#'.
User Login Authentication:#
(config)#

aaa authentication enable default

Use the **aaa authentication enable default** command to create and define the default authentication, authorization, and accounting (AAA) authentication method list used for access to the Enable (privileged) mode. Use the **no** form of this command to disable the authentication method list. Variations of this command include:

aaa authentication enable default enable
aaa authentication enable default group radius
aaa authentication enable default group tacacs+
aaa authentication enable default group <*name*>
aaa authentication enable default line
aaa authentication enable default none

*Each method parameter after **default** specifies the authentication method to be attempted in the order in which they are to be tried. Multiple methods can be specified for authentication, but the authentication procedure is dependent upon the entry order of the methods.*

Syntax Description

none	Specifies that no authentication methods are used. If this method is entered, it should come at the end of the list of authentication methods in the command entry. This method should only be used to prevent a lock-out situation.
line	Specifies using the line password (Telnet 0 through 4 or console 0 through 1) for authentication. The line password must be configured to use this method (using the **password** <*password*> command from the appropriate line interface configuration mode prompt).
enable	Specifies using the Enable mode password for authentication. The Enable mode password must be defined to use this method (using the command *enable password <password> on page 1270*).
group radius	Specifies that all defined remote authentication dial-in user service (RADIUS) servers are used for authentication. RADIUS servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group tacacs+	Specifies that all defined terminal access controller access-control system plus (TACACS+) servers are used for authentication. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group <*name*>	Specifies using a subset of TACACS+ or RADIUS servers for authentication. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.

Default Values

If the Enable mode password is used as an authentication method and the authentication request is going to a RADIUS server, the user name **$enabl15$**is sent by default. If the request is going to a TACACS+ server, the user name used for login authentication is sent by default.

If no default methods list is configured, the unit uses the Enable mode password for authentication. If no password is configured, consoles are allowed access (this prevents a lock-out condition).

Command History

Release 5.1	Command was introduced.
Release 11.1	The **group tacacs+** command was added.

Functional Notes

AAA authentication is an AAA service that helps verify user logins, user access to the Enable mode, and port usage. Authentication works by verifying user credentials with those stored on a server. In AOS, AAA authentication can verify a user's permission to access Enable mode by using the **aaa authentication enable default** command to create the default method list that monitors user permissions.

Before AAA authentication method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA authentication method list relies on a combination of authentication methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. If the unit fails to make a connection with the first group listed, it will try the next group specified.

*For security reasons, Adtran recommends that the **local** authentication method be used instead of the **none** authentication method. Using the **local** authentication method prevents unauthorized users from gaining access to the device during a period in which the links to all authentication servers are down. The local user database contained within the AOS device will always be available and serves as the last line of defense.*

The type of method lists created using the **aaa authentication enable default** command is a default list. A default list is one that is created and automatically applied to all line interfaces at the global level.

To use TACACS+ servers to perform Enable mode authentication, the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for authentication by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for authentication, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

To use RADIUS servers to perform Enable mode authentication, the RADIUS servers must be configured prior to creating the method list. You can configure all RADIUS servers in the system using the command *radius-server on page 1680*. You can configure individual RADIUS servers using the command *radius-server host on page 1682*. Once the RADIUS servers have been configured, you can use all RADIUS servers for authentication by using the **group radius** method. If you only want to use some of the available RADIUS servers for authentication, you can create a named server group and add the RADIUS servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *RADIUS Group Command Set on page 4498*.

For more information about AAA authentication, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies using the line password as the first method of authentication and using the Enable mode password as the second:

(config)**#aaa authentication enable default line enable**

aaa authentication fail-message *<message>*

Use the **aaa authentication fail-message** command to specify the authentication, authorization, and accounting (AAA) authentication fail message. This message is displayed if user authentication fails. Use the **no** form of this command to return to the default message.

Syntax Description

<message>	Specifies the message shown if user authentication fails. The message can be multiple lines. Enter a delimiter (such as **#**) to begin recording the typed text message displayed after a failed authentication attempt. The message must end with the same delimiter to indicate that the message is complete. The text delimiters are not displayed to the screen during operation.

Default Values

By default, the authentication fail message banner is set to **Authentication failed**.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example changes the authentication fail message to **Failed Authentication. Please try again.**:

(config)**#aaa authentication fail-message #**
Enter TEXT message. End with the character '**#**'.
Failed Authentication. Please try again.
(config)#

aaa authentication login

Use the **aaa authentication login** command to create and define a default or named method list for use with authentication, authorization, and accounting (AAA) authentication services. The AAA authentication login method list specifies the methods used to authenticate a user upon login. Use the **no** form of this command to disable the authentication login method list. Variations of this command include:

aaa authentication login default enable
aaa authentication login default group radius
aaa authentication login default group tacacs+
aaa authentication login default group *<name>*
aaa authentication login default line
aaa authentication login default local
aaa authentication login default none
aaa authentication login *<listname>* **enable**
aaa authentication login *<listname>* **group radius**
aaa authentication login *<listname>* **group tacacs+**
aaa authentication login *<listname>* **group** *<name>*
aaa authentication login *<listname>* **line**
aaa authentication login *<listname>* **local**
aaa authentication login *<listname>* **none**

*Each method parameter after **default** or <listname> specifies the authentication method to be attempted in the order in which they are to be tried. Multiple methods can be specified for authentication, but the authentication procedure is dependent upon the entry order of the methods.*

Syntax Description

default	Creates and defines the default login authentication method list to use rather than a named list.
<listname>	Creates and names the login authentication method list to use rather than the default list.
none	Specifies that no authentication methods are used. If this method is entered, it should come at the end of the list of authentication methods in the command entry. This method should only be used to prevent a lock-out situation.
line	Specifies using the line password (Telnet 0 through 4 or console 0 through 1) for authentication. The line password must be configured to use this method (using the **password** *<password>* command from the appropriate line interface configuration mode prompt).
enable	Specifies using the Enable mode password for authentication. The Enable mode password must be defined to use this method (using the command *enable password <password> on page 1270*).

local	Specifies using the local user name for authentication. User names must be in the local user name database to use this method. User names are set using the command *username <username> password <password> on page 1887*.
group radius	Specifies that all defined remote authentication dial-in user service (RADIUS) servers are used for authentication. RADIUS servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group tacacs+	Specifies that all defined terminal access controller access-control system plus (TACACS+) servers are used for authentication. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group <*name*>	Specifies using a subset of TACACS+ or RADIUS servers for authentication. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.

Default Values

By default, AAA authentication login method lists are not defined. Once a default list is defined, it is automatically applied to all line interfaces unless a named list is created and applied manually.

Command History

Release 5.1	Command was introduced.
Release 11.1	The **group tacacs+** command was added.

Functional Notes

AAA authentication is an AAA service that helps verify user logins, user access to the Enable mode, and port usage. Authentication works by verifying user credentials with those stored on a server. In AOS, AAA authentication can verify a user's permission to access the unit by using the **aaa authentication login** command to create a method list that monitors user access permissions.

Before AAA authentication method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA authentication method list relies on a combination of authentication methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. If the unit fails to make a connection with the first group listed, it will try the next group specified.

*For security reasons, Adtran recommends that the **local** authentication method be used instead of the **none** authentication method. Using the **local** authentication method prevents unauthorized users from gaining access to the device during a period in which the links to all authentication servers are down. The local user database contained within the AOS device will always be available and serves as the last line of defense.*

The two types of method lists created using the **aaa authentication login** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA login authentication method lists are applied to line interfaces using the **login authentication** <*listname*> command from the appropriate line interface configuration mode (*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to perform login authentication, the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for authentication by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for authentication, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

To use RADIUS servers to perform login authentication, the RADIUS servers must be configured prior to creating the method list. You can configure all RADIUS servers in the system using the command *radius-server on page 1680*. You can configure individual RADIUS servers using the command *radius-server host on page 1682*. Once the RADIUS servers have been configured, you can use all RADIUS servers for authentication by using the **group radius** method. If you only want to use some of the available RADIUS servers for authentication, you can create a named server group and add the RADIUS servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *RADIUS Group Command Set on page 4498*.

For more information about AAA authentication, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a login authentication list called **myList** and specifies using the **local** database as the first method, **myGroup** as the second method, and **line** password as the third method for login authentication:

(config)**#aaa authentication login myList local group myGroup line**

The following command sets the **default** authentication list for logins to use the **local** database as the first authentication method:

(config)**#aaa authentication login default local**

aaa authentication password-prompt <*prompt*>

Use the **aaa authentication password-prompt** command to specify the message shown when prompting a user for their password during authentication, authorization, and accounting (AAA) authentication. The **no** form of this command returns the prompt to the default prompt.

Syntax Description

<*prompt*>	Specifies the prompt that displays when prompting users for their password. Enter a single line of text enclosed in quotation marks.

Default Values

By default, the authentication password prompt is set to **Password:**.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example specifies the authentication password prompt reads **Please Enter Your Password:**

(config)**#aaa authentication password-prompt "Please Enter Your Password:"**

aaa authentication port-auth default

Use the **aaa authentication port-auth default** command to create and define the default method list for use with authentication, authorization, and accounting (AAA) port authentication services. Use the **no** form of this command to disable the authentication list. Variations of this command include:

aaa authentication port-auth default group radius
aaa authentication port-auth default group <*name*>
aaa authentication port-auth default local
aaa authentication port-auth default none

*Each method parameter after **default** specifies the authentication method to be attempted in the order in which they are to be tried. Multiple methods can be specified for authentication, but the authentication procedure is dependent upon the entry order of the methods.*

Syntax Description

none	Specifies that no authentication methods are used. If this method is entered, it should come at the end of the list of authentication methods in the command entry. This method should only be used to prevent a lock-out situation.
local	Specifies using the local user name for port authentication. User names must be in the local user name database to use this method. User names are set using the command *username <username> password <password> on page 1887*.
group radius	Specifies that all defined remote authentication dial-in user service (RADIUS) servers are used for authentication. RADIUS servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group <*name*>	Specifies using a subset of RADIUS servers for port authentication. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.

Default Values

By default, no port authentication method lists are defined.

Command History

Release 10.1	Command was introduced.

Functional Notes

AAA authentication is an AAA service that helps verify user logins, user access to the Enable mode, and port usage. Authentication works by verifying user credentials with those stored on a server. In AOS, AAA authentication can verify port usage by using the **aaa authentication port-auth default** command to create the default method list that monitors port usage.

Before AAA authentication method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA authentication method list relies on a combination of authentication methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. If the unit fails to make a connection with the first group listed, it will try the next group specified.

*For security reasons, Adtran recommends that the **local** authentication method be used instead of the **none** authentication method. Using the **local** authentication method prevents unauthorized users from gaining access to the device during a period in which the links to all authentication servers are down. The local user database contained within the AOS device will always be available and serves as the last line of defense.*

The type of method lists created using the **aaa authentication port-auth default** command is a default list. A default list is one that is created and automatically applied to all line interfaces at the global level.

To use RADIUS servers to perform port authentication, the RADIUS servers must be configured prior to creating the method list. You can configure all RADIUS servers in the system using the command *radius-server on page 1680*. You can configure individual RADIUS servers using the command *radius-server host on page 1682*. Once the RADIUS servers have been configured, you can use all RADIUS servers for authentication by using the **group radius** method. If you only want to use some of the available RADIUS servers for authentication, you can create a named server group and add the RADIUS servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *RADIUS Group Command Set on page 4498*.

For more information about AAA authentication, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies that the **local** user database be used for port authentication:

(config)**#aaa authentication port-auth default local**

aaa authentication username-prompt <*prompt*>

Use the **aaa authentication username-prompt** command to specify the message shown when prompting a user for their user name during authentication, authorization, and accounting (AAA) authentication. Use the **no** form of this command to return to the default prompt.

Syntax Description

<*prompt*>	Specifies the prompt that displays when prompting users for their user name. Enter a single line of text enclosed in quotation marks.

Default Values

By default, the authentication user name prompt is set to **Username:**.

Command History

Release 5.1	Command was introduced.

Usage Examples

The following example specifies the authentication user name prompt reads **Please Enter Your User Name:**

(config)**#aaa authentication username-prompt “Please Enter Your User Name:”**

aaa authorization commands <*level*>

Use the **aaa authorization commands** command to create and define a default or named authorization method list for use with authentication, authorization, and accounting (AAA) authorization services. AAA command authorization method lists are used to allow or restrict the use of certain commands on a per-user basis. Use the **no** form of this command to disable the authorization commands method list. Variations of this command include:

aaa authorization commands <*level*> **default group tacacs+**
aaa authorization commands <*level*> **default group** <*name*>
aaa authorization commands <*level*> **default if-authenticated**
aaa authorization commands <*level*> **default none**
aaa authorization commands <*level*> <*listname*> **group tacacs+**
aaa authorization commands <*level*> <*listname*> **group** <*name*>
aaa authorization commands <*level*> <*listname*> **if-authenticated**
aaa authorization commands <*level*> <*listname*> **none**

*Each method parameter after **default** or <listname> specifies the authorization method to be attempted in the order in which they are to be tried. Multiple methods can be specified for authorization, but the authorization procedure is dependent upon the entry order of the methods.*

Syntax Description

<*level*>	Specifies whether the method list applies to Level **1** (unprivileged) or Level **15** (privileged) commands.
<*listname*>	Creates and names the authorization commands method list to use rather than the default list.
default	Creates and defines the default authorization commands method list to use rather than a named list.
none	Specifies that no authorization methods are used for command authorization. If this method is entered, it should come at the end of the list of authorization methods in the command entry. This method should only be used to prevent a lock-out situation.
if-authenticated	Specifies that authorization is successful if the user has already been authenticated. AAA authentication must be configured to use this method. Refer to the *Functional Notes* for more information.
group tacacs+	Specifies using all terminal access controller access-control system plus (TACACS+) servers for authorizing command usage. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group <*name*>	Specifies using a subset of TACACS+ servers for authorizing command usage. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.

Default Values

By default, no AAA authorization method lists are defined or applied.

Command History

Release 11.1	Command was introduced.

Functional Notes

AAA authorization is an AAA service that helps limit the network services available to users. Authorization works by retrieving information from the user's profile (stored either on the local database or security server) and uses that information to determine the areas of the network to which the user is allowed access. In AOS, AAA authorization can limit the commands available to a specific user and specify whether or not users can access privileged command line interface (CLI) sessions. Limiting available commands on a per-user basis is achieved by using the **aaa authorization commands** command to create a default or named method list that specifies which level of commands (Level **1** or Level **15**) are authorized.

The user command privilege level (1 or 15) must be defined in addition to specifying all of the commands available on a per-user basis in the configuration of the TACACS+ server. Commands of a particular level are not checked for authorization unless explicitly defined in the configuration with a method list. For example, if a method list is defined for Level 1 commands but not Level 15, then a user is able to enter any Level 15 commands since no authorization takes place due to the lack of a Level 15 commands method list. The same user will only be allowed to enter the Level 1 commands configured for the user in the Level 1 commands method list.

Before AAA authorization method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA authorization method list relies on a combination of authorization methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** <*name*> method that can be entered multiple times to accommodate multiple configured server groups. If the unit fails to make a connection with the first group listed, it will try the next group specified.

*For security reasons, Adtran recommends that the **local** authentication method be used instead of the **none** authentication method. Using the **local** authentication method prevents unauthorized users from gaining access to the device during a period in which the links to all authentication servers are down. The local user database contained within the AOS device will always be available and serves as the last line of defense.*

The two types of method lists created using the **aaa authorization commands** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA command authorization method lists are applied to line interfaces using the **authorization commands** *<level> <listname>* command from the appropriate line interface configuration mode (*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to perform command authorization, the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for authorization by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for authorization, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

For more information about AAA authorization, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a command authorization method list called **myList**, which authorizes unprivileged commands (this succeeds only if the user has been authenticated successfully):

(config)**#aaa authorization commands 1 myList if-authenticated**

The following command defines the **default** command authorization method list to authorize privileged (level 15) commands against all defined TACACS+ servers:

(config)**#aaa authorization commands 15 default group tacacs+**

If command authorization is used in conjunction with a TACACS+ server, the same user name that is used to access AOS must be configured on the server.

aaa authorization config-command

Use the **aaa authorization config-command** command to enable or disable authorization for configuration mode commands in AOS authentication, authorization, and accounting (AAA) services. This command is used to verify that command-level authorization is enabled before applying AAA command authorization method lists to a specific line interface. Use the **no** form of this command to disable authorization for configuration commands.

Syntax Description

No subcommands.

Default Values

By default, authorization for configuration commands is enabled.

Command History

Release 11.1	Command was introduced.

Functional Notes

The **aaa authorization config-command** command is used to ensure that authorization for configuration commands is enabled at the global level before applying any AAA authorization method lists to a line interface (console, Telnet, or secure shell (SSH)). This feature must be enabled before AAA authorization method lists can be applied to the interface.

For more information about AAA authorization, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables authorization of configuration mode commands:

(config)**#aaa authorization config-command**

aaa authorization console

Use the **aaa authorization console** command to enable AOS authentication, authorization, and accounting (AAA) on the console interface. This command is used to verify that the console interface will allow AAA operation before an AAA authorization method list is applied to the console interface. Use the **no** form of this command to disable AAA on the console interface.

Syntax Description

No subcommands.

Default Values

By default, authorization is disabled on a console line interface. This measure prevents accidental lockout issues on directly connected lines.

Command History

Release 11.1	Command was introduced.

Functional Notes

AAA authorization method lists cannot be applied to a console interface until the **aaa authorization console** command has been issued.

For more information about AAA authorization, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables AAA authorization use on console interfaces:

(config)**#aaa authorization console**

aaa authorization exec

Use the **aaa authorization exec** command to create and define a default or named authorization method list for use with authentication, authorization, and accounting (AAA) authorization services. The authorization exec method list sets the parameters for authorizing access to the Enable mode in the command line interface (CLI). Use the **no** form of this command to disable the authorization method list. Variations of this command include:

aaa authorization exec default group <*name*>
aaa authorization exec default group tacacs+
aaa authorization exec default if-authenticated
aaa authorization exec default none
aaa authorization exec <*listname*> **group** <*name*>
aaa authorization exec <*listname*> **group tacacs+**
aaa authorization exec <*listname*> **if-authenticated**
aaa authorization exec <*listname*> **none**

*Each method parameter after **default** or <listname> specifies the authorization method to be attempted in the order in which they are to be tried. Multiple methods can be specified for authorization, but the authorization procedure is dependent upon the entry order of the methods.*

Syntax Description

default	Creates and defines the default authorization method list to use rather than a named method list.
<*listname*>	Creates and names the authorization method list to use rather than the default list.
none	Specifies that no authorization methods are used for executive authorization. If this method is entered, it should come at the end of the list of authorization methods in the command entry. This method should only be used to prevent a lock-out situation.
if-authenticated	Specifies that authorization is successful if the user has already been authenticated. AAA authentication must be configured to use this method.
group tacacs+	Specifies using all terminal access controller access-control system plus (TACACS+) servers for authorizing executive CLI privileges. TACACS+ servers must be configured to use this method. Refer to the *Functional Notes* for more information.
group <*name*>	Specifies using a subset of TACACS+ servers for authorizing executive CLI privileges. Subsets are named server groups previously created using the command *aaa group server on page 1184*. A server group must be configured to use this method.

Default Values

By default, AAA authorization for executive CLI privileges is disabled and no authorization method lists are defined.

Command History

Release 13.1	Command was introduced.

Functional Notes

AAA authorization is an AAA service that helps limit the network services available to users. Authorization works by retrieving information from the user's profile (stored either on the local database or security server) and uses that information to determine the areas of the network to which the user is allowed access. In AOS, AAA authorization can limit the commands available to a specific user and specify whether or not users can access privileged CLI sessions. Limiting access to privileged CLI sessions is achieved by using the **aaa authorization exec** command to create a default or named method list that restricts access to Enable mode.

Before AAA authorization method lists can be configured or applied, AAA must be enabled. To enable AAA, use the command *aaa on on page 1187*.

Each AAA authorization method list relies on a combination of authorization methods. Each method must be entered into the list in the order that they are to be performed. Although these methods can be entered in any order, each can only be used once. The exception is the **group** *<name>* method that can be entered multiple times to accommodate multiple configured server groups. If the unit fails to make a connection with the first group listed, it will try the next group specified.

*For security reasons, Adtran recommends that the **local** authentication method be used instead of the **none** authentication method. Using the **local** authentication method prevents unauthorized users from gaining access to the device during a period in which the links to all authentication servers are down. The local user database contained within the AOS device will always be available and serves as the last line of defense.*

The two types of method lists created using the **aaa authorization exec** command are a default list and a named list. A default list is one that is created and automatically applied to all line interfaces at the global level. A named method list is one that does not perform any action until it is manually applied to an interface. Named AAA exec authorization method lists are applied to line interfaces using the **authorization exec** command from the appropriate line interface configuration mode (*Line (Console) Interface Command Set on page 2021*, *Line (Telnet) Interface Command Set on page 2054*, or *Line (SSH) Interface Command Set on page 2038*).

To use TACACS+ servers to perform Enable mode authorization, the TACACS+ servers must be configured prior to creating the method list. You can configure all TACACS+ servers in the system using the command *tacacs-server on page 1867*. You can configure individual TACACS+ servers using the command *tacacs-server host on page 1868*. Once the TACACS+ servers have been configured, you can use all TACACS+ servers for authorization by using the **group tacacs+** method. If you only want to use some of the available TACACS+ servers for authorization, you can create a named server group and add the TACACS+ servers to the group. Server groups are created using the command *aaa group server on page 1184* and servers are added to the group as outlined in the *TACACS+ Group Command Set on page 4507*.

For more information about AAA authorization, or AAA configuration in general, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates an executive mode authorization method list (called **myList**) to authorize user access to Enable mode in the CLI (this succeeds only if the user has been authenticated successfully):

(config)**#aaa authorization exec myList if-authenticated**

The following example specifies to use the default executive mode authorization method list to authorize access to Enable mode using all TACACS+ servers:

(config)**#aaa authorization exec default group tacacs+**

If a TACACS+ server is used in conjunction with an executive mode access authorization method list, the user name used to access the AOS device must be configured as a Level 15 user on the TACACS+ server.

aaa group server

Use the **aaa group server** command to create a group of remote authentication dial-in user service (RADIUS) servers or a group of terminal access controller access-control system plus (TACACS+) servers. These server groups can be used as methods for authentication, authorization, and accounting (AAA) services in AOS. Use the **no** form of this command to remove a configured server group. Variations of this command include:

aaa group server radius *<group name>*
aaa group server tacacs+ *<group name>*

Syntax Description

radius *<group name>*	Creates and names a group of RADIUS servers.
tacacs+ *<group name>*	Creates and names a group of TACACS+ servers.

Default Values

By default, no named server groups exist.

Command History

Release 5.1	Command was introduced.
Release 11.1	Command was expanded to include TACACS+ server support.

Functional Notes

Server groups can be beneficial when used with AAA method lists because they provide a way to verify AAA services without using all of the configured RADIUS or TACACS+ servers. These server groups are a subset of all RADIUS or TACACS+ servers and can save server resources for other network needs.

Servers must be configured before they can be added to the server group for use with AAA. To configure RADIUS servers on an individual basis, use the command *radius-server host on page 1682*. To configure all RADIUS servers alike, use the command *radius-server on page 1680*. To configure TACACS+ servers on an individual basis, use the command *tacacs-server host on page 1868*. To configure all TACACS+ servers alike, use the command *tacacs-server on page 1867*. It is important to remember when configuring servers for the server group that individual server configurations override any global server configurations.

Once the servers are configured, the **aaa server group** command allows you to begin creating a server group. When you enter the command from the Global Configuration mode prompt, you enter the Server Group Configuration mode. At this point, you can begin to add servers to the group using the **server** command as detailed in the *RADIUS Group Command Set on page 4498* and in the *TACACS+ Group Command Set on page 4507*.

For more information on group server configurations and their use with AAA, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates the named list **RADauthentication** and enters the RADIUS Group Configuration mode for RADIUS servers:

(config)**#aaa group server radius RADauthentication**
(config-sg-radius)#

The following example creates the named list **TACaccount** and enters the TACACS+ Group Configuration mode for TACACS+ servers:

(config)**#aaa group server tacacs+ TACaccount**
(config-sg-tacacs+)#

aaa local authentication attempts max-fail <*number*>

Use the **aaa local authentication attempts max-fail** command to set the maximum number of failed authentication attempts allowed before closing the terminal session when using AAA authentication. Use the **no** form of this command to return to the default setting.

Syntax Description

<*number*>	Specifies the maximum number of failed authentication attempts allowed before closing the terminal session. Valid range is **1** to **25** attempts.

Default Values

By default, the session closes after **3** failed attempts.

Command History

Release 14.1	Command was introduced.

Usage Examples

The following example configures the device to allow a maximum of **10** failed authentication attempts before closing the session:

(config)**#aaa local authentication attempts max-fail 10**

aaa on

Use the **aaa on** command to activate authentication, authorization, and accounting (AAA) services. Use the **no** form of this command to deactivate AAA.

Syntax Description

No subcommands.

Default Values

By default, AAA is not activated.

Command History

Release 5.1	Command was introduced.

Functional Notes

By default, AAA is disabled. AAA must be enabled for additional AAA configuration commands to be available. If AAA is enabled, AAA methods will override other security methods specified in the line interface.

For more information about the use and configuration of AAA, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example activates AAA services:

(config)**#aaa on**

aaa processes <*value*>

Use the **aaa processes** command to set the number of threads available to the authentication, authorization, and accounting (AAA) background processes. Use the **no** form of this command to return to the default setting.

Syntax Description

<*value*>	Specifies the number of threads available to the AAA subsystem. Range is **1** to **64** threads.

Default Values

By default, the number of threads is set to **1**.

Command History

Release 5.1	Command was introduced.

Functional Notes

Increasing the number of threads may speed up simultaneous authentication processes, but can do so at the cost of system resources (for example, memory).

For more information about AAA, refer to the *Configuring AAA in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies five available threads for AAA background processes:

(config)**#aaa processes 5**

activchassis deallocate *<vcid>*

Use the **activchassis deallocate** command to delete the entire configuration for a particular device from the ActivChassis configuration.

Syntax Description

<vcid>	Specifies the virtual chassis ID (VCID) of the device to delete from the ActivChassis. Valid range is **1** to **8**. Values 1 and 2 refer to the master and backup device, respectively.

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.

Functional Notes

The following rules apply to this command:

- The device currently using the specified VCID value must be disconnected and not communicating with the ActivChassis. If the device is connected to ActivChassis, the command is not performed.
- If the device later reconnects to the Activchassis with the same VCID value, it is treated as if it is a new device being added to ActivChassis.
- The VCID cannot be that of the current master.
- Once the command is issued, the device whose VCID has been removed is returned to the linecard default state.

When this command is issued, all configuration corresponding to the device with the specified VCID is deleted from the ActivChassis configuration and the master device's hardware manifest. If the device later reconnects to the ActivChassis with the same VCID value, it is treated as if it is a new device.

The device that has the VCID to be deleted cannot be connected to the ActivChassis when the command is issued. It must be disconnected from the chassis before issuing the command. In addition, deleting the VCID does not change the VCID on the device using that VCID value. You should default the device to clear all ActivChassis information (refer to the command *activchassis restore-linecard-dflt on page 1192*).

Usage Examples

The following example deletes an allocated VCID on a disconnected, non-master device:

(config)**#activchassis deallocate 6**

activchassis front-panel-config

Use the **activchassis front-panel-config** command to enable the ability to configure an ActivChassis ID (VCID) from an ActivChassis device's front panel. Use the **no** form of this command to disable this feature.

Syntax Description

No subcommands.

Default Values

By default, this feature is enabled.

Command History

Release AC1.0	Command was introduced.

Functional Notes

The VCID can always be monitored from a device's front panel.

This command is available from both the ActivChassis master and linecard devices' CLI. For more information about the difference between linecard and master devices, how to access the CLI for each, and additional configuration information, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies that front panel configuration of the VCID is disabled for all ActivChassis members:

(config)**#no activchassis front-panel-config**

activchassis renumber *<from vcid> <to vcid>*

Use the **activchassis renumber** command to modify a master-assigned ActivChassis ID (VCID) of an ActivChassis device. This command changes a device's VCID from its current value to a different value. The change is made on the device and in the ActivChassis hardware manifest, but not in the ActivChassis configuration.

Syntax Description

<from vcid>	The current VCID that will be changed on the ActivChassis device. Valid range is **1** to **8** (VCID **1** and **2** refer to the master and backup ActivChassis device, respectively).
<to vcid>	The new VCID to be assigned to the ActivChassis device. Valid range is **1** to **8** (VCID **1** and **2** refer to the master and backup ActivChassis device, respectively).

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.

Functional Notes

When using this command, remember that the device that currently has the *<from vcid>* value assigned must be connected and actively communicating in the ActivChassis to be renumbered. Neither VCID value can be that of the current master. Master VCID devices must be reassigned by rebooting the device as a standalone unit and then entering the command *activchassis vcid on page 1194*. In addition, the *<to vcid>* value must not be currently allocated. If the value is allocated, you must first deallocate it using the command *activchassis deallocate <vcid> on page 1189*.

If the device with the *<from vcid>* value is present in the ActivChassis, and the VCID values are valid, a warning is displayed indicating that the current VCID and configuration will be changed. You must confirm the changes to be made. Once the changes are confirmed, the VCID of the device is updated to the specified *<to vcid>* value, the master device's manifest is updated with the change, and the targeted device is rebooted for the changes to take effect. The new role and configuration of the new VCID are applied to the device after reboot.

For more information about configuring ActivChassis, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example changes an allocated VCID (**3**) on a non-master device to VCID **4**:

(config)#**activchassis renumber 3 4**

activchassis restore-linecard-dflt

Use the **activchassis restore-linecard-dflt** command to return an ActivChassis device to the default linecard settings. This command clears the local copy of the ActivChassis manifest, the virtual chassis ID (VCID), and the startup configuration for the device. This command is most useful when a device that was connected to an ActivChassis needs to be restored to the factory settings or have all knowledge of its existence in the virtual chassis removed.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release AC1.0	Command was introduced.

Functional Notes

This command is available from both the ActivChassis master and linecard devices' CLI. For more information about the difference between linecard and master devices, how to access the CLI for each, and additional configuration information, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example defaults a non-linecard (master or backup) ActivChassis device:

(config)**#activchassis restore-linecard-dflt**

activchassis strict-firmware

Use the **activchassis strict-firmware** command to prevent linecard devices from joining an ActivChassis when their firmware image differs from that of the master device. Use the **no** form of this command to allow linecard devices with different firmware images to join the chassis.

Syntax Description

No subcommands.

Default Values

By default, linecard devices with different firmware images are allowed to join the ActivChassis.

Command History

Release AC1.0	Command was introduced.

Functional Notes

When linecard devices have mismatched firmware, Activchassis displays a warning message every 30 seconds that states which linecard has the improper firmware.

For more information about configuring ActivChassis, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies that all linecard devices must have the same firmware image as the master device before they can join the ActivChassis:

(config)**#activchassis strict-firmware**

activchassis vcid

Use the **activchassis vcid** command to create an ActivChassis master device or specify a local standalone device as a member of the ActivChassis and to specify the virtual chassis ID (VCID). Use the **no** version of this command to disable the ability to configure the VCID on the local device. Variations of this command include:

activchassis vcid master-assigned
activchassis vcid <*value*>

Syntax Description

master-assigned	Specifies that the VCID is assigned by the master device when a standalone device is admitted to the ActivChassis.
<*value*>	Specifies the VCID as a value between **1** and **8**. Values **1** and **2** are used to specify a master and backup device, respectively.

Default Values

By default, when a standalone device joins the ActivChassis the VCID is **master-assigned**.

Command History

Release AC1.0	Command was introduced.

Functional Notes

Once this command is entered, you are asked to confirm that the device configuration and operating mode will be altered. After confirmation, if the device is currently ActivChassis disabled, it becomes ActivChassis enabled, and the file system is updated with the VCID. If the device has already been ActivChassis enabled, the VCID is changed to the specified value. In either case, the device reboots, and any unconfigured ActivChassis capable ports on the device default to ActivChassis mode.

If the command is entered on a device that is already ActivChassis enabled, and the VCID specified is the same as the VCID currently in use, it will have no effect and the command will not be performed.

This command is available from both the ActivChassis master and linecard devices' CLI. For more information about the difference between linecard and master devices, how to access the CLI for each, and additional configuration information, refer to the configuration guide *Configuring ActivChassis in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables ActivChassis and specifies the VCID of the device:

(config)**#activchassis vcid 3**

arp <*ip address*> <*mac address*> arpa

Use the **arp arpa** command to enter static entries into the Address Resolution Protocol (ARP) table for a specific virtual routing and forwarding (VRF) instance. Use the **no** form of this command to remove a static ARP entry. Variations of this command include:

arp <*ip address*> <*mac address*> **arpa**
arp <*ip address*> <*mac address*> **vrf** <*name*> **arpa**

Syntax Description

<*ip address*>	Specifies a valid IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<*mac address*>	Specifies a valid 48-bit medium access control (MAC) address. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
vrf <*name*>	Optional. Specifies the VRF where the ARP table exists.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example enters the IP address and MAC address into the ARP table that is located in the default VRF:

(config)**#arp 10.10.10.1 00:A0:C8:00:00:01 arpa**

as-path-list *<name>*

Use the **as-path-list** command to create IP autonomous system (AS) path lists for route map use. Use the **no** form of this command to delete the AS path list.

Syntax Description

<name>	Specifies the name of the AS path list. Refer to *AS Path List Command Set on page 3978* for more information on the available options.

Default Values

By default, no AS path lists are defined.

Command History

Release 9.3	Command was introduced.
Release R10.1.0	The **ip** keyword was removed from this command.

Functional Notes

AS path lists are a type of route filter that permits or denies Border Gateway Protocol (BGP) routes based on the AS_PATH attribute. AS path lists define a list of AS specifications that, once created, may then be referenced in a route map. Refer to the *Usage Examples* section below.

Usage Examples

The following example creates the AS path list **list5** and enters the IP **as-path-list** command mode:

```
(config)#as-path-list list5
(config-as-path-list)#
```

auto-config

Use the **auto-config** command to enable and start the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Use the **no** form of this command to halt the automatic configuration process.

*Disabling using the **no auto-config** command and re-enabling using the **auto-config** command, restarts the download process.*

Syntax Description

No subcommands.

Default Values

By default, **auto-config** is enabled on the Total Access 900(e) Series, NetVanta 644, NetVanta 1335, NetVanta 3000 Series, NetVanta 4000 Series, NetVanta 5000 Series, and NetVanta 6000 Series products. By default, **auto-config** is disabled on all other products not specified above.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following example enables automatic configuration:

(config)**#auto-config**

auto-config apply-config

Use the **auto-config apply-config** command to specify the preferred method of applying the AOS automatic self-configuration settings to the running configuration. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Variations of this command include:

auto-config apply-config append
auto-config apply-config replace

Syntax Description

append	Appends the automatic self-configuration parameters to the end of the current running configuration and retains the existing running configuration. It does not save this information to the startup configuration. Refer to the *Functional Notes* below for more information.
replace	Replaces the startup configuration. This parameter erases all current configuration information and saves to the startup configuration.

Default Values

By default, the configuration is set to **append**.

Command History

Release R10.5.0	Command was introduced.

Functional Notes

Using the **append** keyword only appends the parameters to the currently running configuration. The appended parameters will not be retained if the unit is rebooted. To permanently store the appended configuration settings, you must save the running configuration as the startup configuration by issuing the **do write** command. This can be performed manually, after the append process is complete, or added as the final line in the self-configuration parameters to automatically save after appending.

Usage Examples

The following example overwrites the startup configuration:

(config)**#auto-config apply-config replace**

The following example adds the configuration parameters to the running configuration:

(config)**#auto-config apply-config append**

auto-config authname <*username*> password <*password*>

Use the **auto-config authname password** command to specify the user name and password to use for authentication with the AOS automatic self-configuration feature. If authentication is required for Trivial File Transfer Protocol (TFTP), Hypertext Transfer Protocol (HTTP), and Hypertext Transfer Protocol Secure (HTTPS), the user name and password must be resolved before the file transfer can commence. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com.

Syntax Description

authname <*authname*>	Enter the authentication user name or define a system variable using parameters representing one of the following system values: $SYSTEM_NAME - the host name of the system $SYSTEM_SERIAL_NUMBER - the serial number of the system $SYSTEM_DESCRIPTION - the product name and software version $SYSTEM_SOFTWARE_VERSION - the running software version $AUTH_MAC_ADDRESS - MAC address for MAC authentication
password <*password*>	Specifies the authentication password.

Default Values

By default, this setting is disabled.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example specifies the Auto-Config authentication user name as the system serial number and specifies the password to use:

(config)**#auto-config authname $SYSTEM_SERIAL_NUMBER password fRiax&crOus9l#p**

auto-config filename

Use the **auto-config filename** command to specify the file name to download for the AOS automatic self-configuration feature. The file name can be defined as a static file name or defined using parameters representing system values. A static file name can include a partial path. The file name can also be defined using Dynamic Host Configuration Protocol (DHCP) Option 67. Use the **no** form of this command to erase the stored file name. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Variations of this command include:

auto-config filename <*name*>
auto-config filename dhcp

Syntax Description

filename dhcp	Specifies the configuration file name is provided through DHCP Option 67.
filename <*name*>	Specify the configuration file name or define a system parameter using variables. Including the file path in addition to the file name or variable is optional. The following variables are allowed to represent system values: $SYSTEM_NAME - host name of the system $SYSTEM_SERIAL_NUMBER - serial number of the system $SYSTEM_DESCRIPTION - product name and software version $SYSTEM_SOFTWARE_VERSION - running software's version $AUTH_MAC_ADDRESS - MAC address used for MAC authentication

Default Values

By default, the file name uses DHCP Option 67 to retrieve the file name.

Command History

Release 11.1	Command was introduced.
Release R10.5.0	Command was expanded to include parameter **dhcp** for DHCP Option 67.

Functional Notes

If no file name is specified, Auto-Config attempts to locate additional configuration files on the server device as a fallback measure. The configuration file names searched for in such a situation include (in order of priority): a file name based on MAC addresses (<*MAC#1*>**.cfg**), a file name based on the AOS device part number (**adtran_**<*Unit Part Number*>**.cfg**), and the Adtran default file name (**adtran_000000000000.cfg**).

Usage Examples

The following command specifies a static file name to download:

(config)**#auto-config filename AUTO_CONFIG.cfg**

The following command specifies a static file name and includes a path to the file:

(config)**#auto-config filename config/adtran/AUTO_CONFIG.cfg**

The following command configures the unit to retrieve the file name according to the DHCP Option 67:

(config)**#auto-config filename dhcp**

The following command specifies the file name using the system variable SYSTEM NAME:

(config)**#auto-config filename $SYSTEM_NAME.cfg**

The following command specifies the file name using the system variable SYSTEM NAME and includes the file path:

(config)**#auto-config filename config/adtran/$SYSTEM_NAME.cfg**

auto-config firmware

Use the **auto-config firmware** command to enable and configure firmware download for the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com.Variations of this command include:

auto-config firmware definition-file <*name*>
auto-config firmware destination cflash
auto-config firmware destination flash
auto-config firmware download
auto-config firmware reload-after <*seconds*>
auto-config firmware replace primary maintain secondary
auto-config firmware replace primary update secondary
auto-config firmware replace secondary

Syntax Description

definition-file <*name*>	Specifies the path and static file name of the definition file.
destination	Specifies where to store the downloaded firmware image.
cflash	Specifies to store the downloaded firmware image on the unit's CompactFlash memory.
flash	Specifies to store the downloaded firmware image on the unit's flash memory.
download	Enables the firmware download.
reload-after <*seconds*>	Specifies the delay, in seconds,after downloading the new firmware image before the unit reboots. The valid range is **60** through **604800**. Use the value **0** to disable the reboot.
replace primary	Specifies to replace the current primary firmware image with the new image.
maintain secondary	Specifies to retain the existing secondary firmware image, if one exists, and delete the current primary image.
update secondary	Specifies that the existing primary firmware image becomes the new secondary image, and deletes the existing secondary image.
replace secondary	Specifies to replace the existing secondary firmware image with the new image, deleting the existing secondary image, while retaining the current primary image.

Default Values

By default, this feature is disabled. When enabled, the default file system is **flash** unless otherwise specified.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example specifies the name and location and name of the definition file:

(config)**#auto-config firmware definition-file config/adtran/myconfig.biz**

The following example specifies the download location as the CompactFlash memory:

(config)**#auto-config firmware destination cflash**

auto-config http-auth

Use the **auto-config http-auth** command to configure the Hypertext Transfer Protocol (HTTP) authentication mode for the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Use the **no** form of this command to disable the specified mode. Each mode can be turned on or off individually. Variations of this command include:

auto-config http-auth basic
auto-config http-auth digest

> NOTE *At least one mode must be enabled at all times. An error message will occur if an attempt is made to disable both authentication modes.*

Syntax Description

basic	Enables the HTTP(S) basic authentication mode, using clear text authentication.
digest	Enables the HTTP(S) digest authentication mode, using encrypted text authentication.

Default Values

By default, both **basic** and **digest** modes are enabled.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example enables the basic HTTP authentication mode:

(config)**#auto-config http-auth basic**

The following example disables the digest HTTP authentication mode:

(config)**#no auto-config http-auth digest**

auto-config mac-auth

Use the **auto-config mac-auth** command to configure medium access control (MAC) address authentication for the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Variations of this command include:

auto-config mac-auth address <*mac address*>
auto-config mac-auth interface <*interface*>
auto-config mac-auth mode http-user-agent
auto-config mac-auth mode none

Syntax Description

address <*mac address*>	Specifies the 48-bit MAC address to use for authentication. MAC addresses should be expressed in the following format xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**). For this command, colons are optional.
interface <*interface*>	Specifies an interface from which to use the MAC address for authentication. Specify an interface in the format *<interface type [slot/port | slot/port.subinterface id | interface id | interface id.subinterface id]>*. For example, for an Ethernet interface, use **eth 0/1**, for an Ethernet subinterface, use **eth 0/1.1**. Type **auto-config mac-auth interface ?** for a complete list of valid interfaces.
mode	Specifies the MAC authentication mode to use.
http-user-agent	Specifies including the MAC address in the HTTP User Agent header.
none	Specifies not to include the MAC address in the HTTP User Agent header.

Default Values

By default, MAC authentication is disabled.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example enables **http-user-agent** mode and specifies the MAC address **00:A0:C8:00:00:01** for authentication:

(config)**#auto-config mac-auth mode http-user-agent**
(config)**#auto-config mac-auth address 00:A0:C8:00:00:01**

The following example enables **http-user-agent** mode and specifies using the MAC address assigned to the Ethernet 0/1 interface for authentication:

(config)**#auto-config mac-auth mode http-user-agent**
(config)**#auto-config mac-auth interface ethernet 0/1**

The following example disables MAC address authentication:

(config)**#auto-config mac-auth mode none**

auto-config method

Use the **auto-config method** command to configure the file transfer method to use during AOS automatic self-configuration. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Variations of this command include:

auto-config method http
auto-config method http port <*number*>
auto-config method https
auto-config method https allow-tls1.0
auto-config method https allow-tls1.0 allow-tls1.1
auto-config method https allow-tls1.0 allow-tls1.1 allow-sslv3
auto-config method https allow-tls1.0 allow-sslv3
auto-config method https allow-tls1.1
auto-config method https allow-tls1.1 allow-sslv3
auto-config method https allow-sslv3
auto-config method https port <*number*>
auto-config method https port <*number*> **allow-tls1.0**
auto-config method https port <*number*> **allow-tls1.0 allow-tls1.1**
auto-config method https port <*number*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
auto-config method https port <*number*> **allow-tls1.0 allow-sslv3**
auto-config method https port <*number*> **allow-tls1.1**
auto-config method https port <*number*> **allow-tls1.1 allow-sslv3**
auto-config method https port <*number*> **allow-sslv3**
auto-config method tftp

Syntax Description

http	Specifies using Hypertext Transfer Protocol (HTTP) for the file transfer method.
https	Specifies using Hypertext Transfer Protocol Secure (HTTPS) for the file transfer method.
allow-tls1.0	Optional. Allows the use of Transport Layer Security protocol version 1.0. If **allow-tls1.0** is enabled, Secure Socket Layer version 3 (SSLv3) can also optionally be enabled.
allow-tls1.1	Optional. Allows the use of TLS protocol version 1.1 if **allow-tls1.1** is enabled. SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the use of SSLv3. If SSLv3 is enabled, TLS version 1.0 is automatically enabled.
port <*number*>	Optional. Specifies the port number to use for the HTTP(S) file transfer method. The valid range is **1** through **65535**. If a specific port number is not entered, the default port number is used.
tftp	Specifies using Trivial File Transfer Protocol (TFTP) for the file transfer method.

Default Values

By default, the file transfer method is TFTP. If specifying HTTP, the default port is 80. If specifying HTTPS, the default port is 443.

Command History

Release R10.5.0	Command was introduced.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** and **allow-sslv3** parameters.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example enables TFTP as the file transfer method for automatic configuration:

(config)**#auto-config method tftp**

The following example enables HTTPS as the file transfer method and uses the default HTTPS port of **443**:

(config)**#auto-config method https**

The following example enables HTTPS as the file transfer method, and specifies using the port number **6335**:

(config)#auto-config method https port **6335**

auto-config retry-count *<number>*

Use the **auto-config retry-count** command to specify the maximum number of retries allowed to download a configuration file through AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Use the **no** form of this command to return to the default number of retries.

Syntax Description

<number>	Specify the maximum number of attempts allowed. Valid range is **0** to **1000**.

Default Values

By default, the number of retries is set to **0** allowing the feature to continuously retry until the feature is disabled.

Command History

Release 11.1	Command was introduced.

Usage Examples

The following command sets the number of retries when downloading a configuration file to **100**:

(config)**#auto-config retry-count 100**

auto-config server

Use the **auto-config server** command to specify the Trivial File Transfer Protocol (TFTP) or Dynamic Host Configuration Protocol (DHCP) server to use during automatic self-configuration. The TFTP or DHCP server provides the configuration file necessary for automatic self-configuration. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Use the **no** form of this command to erase the stored server name. Variations of this command include:

auto-config server [<*hostname*> **|** <*ipv4 address*>**]**
auto-config server dhcp
auto-config server dhcp option [66 | **160]**

Syntax Description

server dhcp	Specifies using DHCP Option 66 to locate the server.
server dhcp option 66	Optional. Specifies using Option 66 to locate the server.
server dhcp option 160	Optional. Specifies using Option 160 to locate the server.
server [<*hostname*> **|** <*ipv4 address*>**]**	Specifies the IPv4 address or host name of TFTP server. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

Default Values

By default, Auto-Config attempts to locate the server using DHCP Option 66.

Command History

Release 11.1	Command was introduced.
Release R10.5.0	Command was expanded to include **dhcp**, **dhcp option 66**, and **dhcp option 160** parameters.

Usage Examples

The following command specifies the TFTP server IPv4 address from which to download the configuration file:

(config)**#auto-config server 192.33.5.99**

The following command specifies the TFTP server host name from which to download the configuration file:

(config)**#auto-config server MYHOST**

The following command specifies using DHCP Option 66 to locate the DHCP server from which to download the configuration file:

(config)**#auto-config server dhcp 66**

auto-config sip-notify reboot

Use the **auto-config sip-notify reboot** command to specify the units reboot behavior when receiving a SIP NOTIFY. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com.Variations of this command include:

auto-config sip-notify reboot always
auto-config sip-notify reboot on-change

Syntax Description

always	Specifies that the unit reboot regardless of the configuration.
on-change	Specifies that the unit reboot only if the configuration on the server has changed.

Default Values

By default, the reboot behavior when receiving a SIP NOTIFY is **on-change**.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example specifies that the unit reboot regardless of the configuration when receiving a SIP NOTIFY:

(config)**#auto-config sip-notify reboot always**

auto-config sip-notify user <*user*>

Use the **auto-config sip-notify user** command to enable and configure a Session Initiation Protocol (SIP) user to receive check-sync events to initiate the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com. Use the **no** form of this command to halt the automatic configuration process.

> NOTE *Only certain AOS devices support SIP NOTIFY check-sync events. In order for the SIP NOTIFY message to be received, the AOS platform must support **sip** (this excludes switches and routers without SIP proxy), and have it enabled in the configuration. The firewall must be provisioned to allow the unit to receive SIP messages from the server.*

Syntax Description

<*user*>	Specifies the SIP user to which the NOTIFY (check-sync event) is sent.

Default Values

By default, this feature is disabled.

Command History

Release R10.5.0	Command was introduced.

Usage Examples

The following example enables the SIP user **2001** to receive the SIP NOTIFY (check-sync event):

(config)**#auto-config sip-notify user 2001**

auto-config timer polling <*seconds*>

Use the **auto-config timer polling** command to periodically restart the AOS automatic self-configuration feature. For more detailed information, refer to the *Configuring Auto-Config* guide available online at https://supportcommunity.adtran.com.

Syntax Description

<*seconds*>	Specifies the restart interval in seconds. The valid range is **30** to **2592000**.

Default Values

By default, this feature is disabled.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example sets the restart interval to **320** seconds:

(config)**#auto-config timer polling 320**

auto-link

Use the **auto-link** command to enable the auto-link feature, to specify the communication method between an AOS device and the n-Command® managed service provider (MSP) server, and to optionally specify the service name prefix of service (SRV) record requests. Communication can be either via Hypertext Transfer Protocol (HTTP) or Hypertext Transfer Protocol over Secure Socket Layer (HTTPS). Auto-link allows a client device to connect to an Adtran n-Command MSP network management appliance. Use the **no** form of this command to disable auto-link or to return to the default communication method. Variations of this command include:

auto-link
auto-link http
auto-link http srv <*prefix*>
auto-link https
auto-link https allow-tls1.0
auto-link https allow-tls1.1
auto-link https srv <*prefix*>
auto-link https allow-tls1.0 srv <*prefix*>
auto-link https allow-tls1.1 srv <*prefix*>

Syntax Description

http	Optional. Specifies that the client use the HTTP posting method.
https	Optional. Specifies that the client use the HTTPS posting method.
allow-tls1.0	Optional. Enables support for Transport Layer Security (TLS) protocol version 1.0.
allow-tls1.1	Optional. Enables support for TLS protocol version 1.1.
srv <*prefix*>	Optional. Specifies the service name prefix of SRV requests.

Default Values

By default, auto-link is disabled. By default, auto-link uses **HTTPS**. By default, if no service name prefix is configured, auto-link uses **_http** for HTTP communication, and **_https** for HTTPS communication. By default, support for TLS version 1.0 is disabled.

Command History

Release 17.3/A1	Command was introduced.
Release R10.7.0	Command was expanded to include the **srv** <*prefix*> parameter.
Release R12.3.0	Command was expanded to include the **allow-tls1.0** parameter.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Functional Notes

The n-Command client must first be configured and enabled before the n-Command MSP server can be contacted. The n-Command MSP server is a network management appliance that enables auto-discovery of the AOS unit and provides a central management solution for configuration changes, firmware updates, and basic monitoring. Without enabling auto-link, the client will not be detected by the server. For more information about configuring the auto-link feature, refer to the configuration guide *Configuring Auto-Link for AOS and n-Command MSP* available online at https://supportcommunity.adtran.com.

The service name prefix, such as **_http**, can be any arbitrary string, but the protocol prefix is **_tcp** for auto-link. Do not include the leading underscore for service name prefixes. The underscore is added automatically.

TLS versions 1.0 and 1.1 can no longer be used as a security control due to their weakness as cryptography methods. By default, TLS version 1.0 and 1.1 are disabled for auto-link configurations.

Usage Examples

The following example enables auto-link:

(config)**#auto-link**

The following example specifies that the client use HTTP to communicate with the server:

(config)**#auto-link http**

auto-link penalty *<value>*

Use the **auto-link penalty** command to enable and configure a temporary penalty list for auto-link configuration. The temporary penalty list blacklists hosts that cause repeated communication failures. If a server of configured IP address causes a failover event three consecutive times, it is added to the penalty list. Once added to the list, auto-link will not contact the server for a configured number of recontact intervals. Using the **no** form of this command removes the penalty list from the auto-link configuration.

Syntax Description

<value>	Specifies the number of recontact intervals that the server will stay on the penalty list. Valid range is **0** to **65535**. Using a value of **0** disables the penalty feature.

Default Values

By default, the penalty feature is disabled.

Command History

Release R10.7.0	Command was introduced.

Functional Notes

Penalty lists can be based on IP addresses and port numbers. Host IP addresses and port numbers returned from DNS requests, as well as configured IP addresses and port numbers, can be penalized.

Usage Examples

The following example enables recontact interval penalties and specifies that penalized servers remain on the list for **30** recontact intervals:

(config)**#auto-link penalty 30**

auto-link recontact-interval *<value>*

Use the **auto-link recontact-interval** command to specify the intervals between contact attempts between the AOS client and the n-Command® managed service provider (MSP) server. Use the **no** form of this command to return to the default value.

Syntax Description

<value>	Specifies the time in seconds between contact attempts. Range is **20** to **604800** seconds. Setting this value to **0** seconds disables the recontact feature.

Default Values

By default, the recontact interval is set to **3600** seconds.

Command History

Release 17.3/A1	Command was introduced.

Usage Examples

The following example sets the recontact interval to **7200** seconds:

(config)**#auto-link recontact-interval 7200**

auto-link region *<region name>*

Use the **auto-link region** command to assign a region name to an AOS device associated with the n-Command® managed service provider (MSP) server. Use the **no** form of this command to remove the region name from the AOS device's configuration.

Syntax Description

<region name>	Specifies the name of the region associated with the AOS device. Specify the region name in a text string.

Default Values

By default, a region name is not specified.

Command History

Release R13.1.0	Command was introduced.

Functional Notes

Regions are used in n-Command® MSP to allow network administrators to limit a specific user's access to devices. For user regions to work properly, the AOS device must be assigned a region name, a region must be created in n-Command® MSP with a filter value that matches all or part of the created AOS device's region name, and the region must be assigned to a user.

Usage Examples

The following example sets the region name for the AOS device:

(config)**#auto-link region REGIONONELOCAL**

auto-link server <*hostname* | *ip address*>

Use the **auto-link server** command to specify the contact information for the n-Command® managed service provider (MSP) server used by the AOS client. Use the **no** form of this command to remove the server from the client configuration. Variations of this command include:

auto-link server primary <*hostname* | *ip address*>
auto-link server primary <*hostname* | *ip address*> **port** <*port*>
auto-link server secondary <*hostname* | *ip address*>
auto-link server secondary <*hostname* | *ip address*> **port** <*port*>

Syntax Description

primary	Specifies the primary auto-link server. The primary server must be specified. Only one entry is allowed for the primary server.
secondary	Specifies the secondary auto-link server. Secondary servers are used in auto-link failover situations where the primary server is unavailable. Multiple secondary servers can be configured. The priority of secondary servers is determined by the order in which the servers are configured.
<*hostname* | *ip address*>	Specifies the server host name or IP address. IP addresses should be expressed in the decimal dotted notation (for example **10.10.10.1**).
port <*port*>	Optional. Specifies the port number used to communicate with the server. Valid range is **1** to **65535**.

Default Values

By default, no server is configured. When specified, the server uses port **80** for Hypertext Transfer Protocol (HTTP) and port **443** for HTTP secure (HTTPS).

Command History

Release 17.3/A1	Command was introduced.
Release R10.7.0	Command was expanded to include options to specify **primary** and **secondary** servers.

Functional Notes

The host name or the IP address of the server with which the AOS product communicates must be specified for communication to take place. A primary server must be specified, and secondary servers can optionally be configured. Only one entry is allowed for the primary MSP server. To delete the primary MSP server, you must first remove all configured secondary servers.

Usage Examples

The following example specifies the AOS client will communicate with the primary n-Command MSP server at IP address **10.10.10.10**:

(config)**#auto-link server primary 10.10.10.10**

auto-link vrf *<name>*

Use the **auto-link vrf** command to specify the virtual routing and forwarding (VRF) instance on which auto-link will communicate. Use the **no** form of this command to return to the default value.

Syntax Description

<name>	Specifies the name of the VRF on which auto-link will operate.

Default Values

By default, auto-link is configured to operate on the default (unnamed) VRF.

Command History

Release R11.12.0	Command was introduced.

Functional Notes

All auto-link messages, such as information status messages and backup file uploads, are transmitted on the default VRF. When a domain name is specified as the auto-link server, the domain name system (DNS) operation also occurs on the specified VRF.

This command is configured separate from the command *auto-link on page 1214*, which enables/disables the auto-link feature.

If a specified VRF does not exist, an error is returned.

When a nondefault VRF is configured for auto-link, the VRF is displayed in the output of the command *show auto-link on page 557*. If auto-link is configured to operate on the default VRF, then the VRF information is not displayed in the **show** command output.

Usage Examples

The following example configured auto-link to use the nondefault VRF **RED**:

(config)**#auto-link vrf RED**

banner

Use the **banner** command to specify messages to be displayed in certain situations. Use the **no** form of this command to delete a previously configured banner. Variations of this command include:

banner exec *<delimiter> <message> <delimiter>*
banner login *<delimiter> <message> <delimiter>*
banner motd *<delimiter> <message> <delimiter>*

Syntax Description

exec	Creates a message to be displayed when any executive-level process takes place.
login	Creates a message to be displayed before the user name and password login prompts.
motd	Creates a message-of-the-day (MOTD) banner.
<delimiter>	Specifies the banner text delimiter. Press **Enter** after the delimiter character to begin input of banner text. After typing the banner message, enter the same delimiter character to end the message.
<message>	Specifies the text message you wish to display.

Default Values

By default, no banners are configured.

Command History

Release 2.1	Command was introduced.

Functional Notes

Banners appear in the following order (if configured):

- MOTD banner appears at initial connection.
- Login banner follows the MOTD banner.
- Exec banner appears after successful login.

Usage Examples

The following example configures the system to display a message of the day:

(config)**#banner motd *The system will be shut down today from 7PM to 11PM***

battery <*slot/port*>

Use the **battery** <*slot/port*> command to enter the Battery Configuration mode for the specified slot and port, in order to configure the battery installation time and date.

Additional subcommands are available once you have entered the Battery Configuration mode. Use the **no** form of the **install date set** commands to clear the settings. Variations of the commands include:

install date set <*time*> <*date*>
install date set clock

Syntax Description

<*slot/port*>	Specifies the slot and port of the battery.
install date set <*time*> <*date*>	Specifies a time and date for when the battery is installed. Enter the <*time*> value in the HH:MM:SS format. Enter the <*date*> value in the DD Month YYYY format.
install date set clock	Specifies the battery install date and time is set using the system clock if the system clock has been set either manually or from NTP.

Default Values

By default, no battery install time and date exists.

Command History

Release R11.10.0	Command was introduced.
Release R11.11.0	Command was expanded to include the **clock** parameter.

Usage Examples

The following example enters the Battery Configuration mode for slot **0**, port **1** and sets the install time to **12:30:22** and date to **4 June 2015**:

(config)**#battery 0/1**
(config-battery 0/1)**#install date set 12:30:22 4 June 2015**
(config-battery 0/1)**#exit**
(config)**#**

boot config

Use the **boot config** command to modify system boot parameters by specifying the location and name of primary and secondary configuration files. Use the **no** form of this command to use the default startup configuration file. Variations of this command include:

boot config cflash <*primary filename*>
boot config cflash <*primary filename*> **cflash** <*secondary filename*>
boot config cflash <*primary filename*> **flash** <*secondary filename*>
boot config flash <*primary filename*>
boot config flash <*primary filename*> **cflash** <*secondary filename*>
boot config flash <*primary filename*> **flash** <*secondary filename*>
boot config flash <*primary filename*> **usbdrive0** <*secondary filename*>
boot config usbdrive0 <*primary filename*>
boot config usbdrive0 <*primary filename*> **flash** <*secondary filename*>
boot config usbdrive0 <*primary filename*> **usbdrive0** <*secondary filename*>

NOTE *The **cflash** parameter is only valid for units with CompactFlash® capabilities.*

NOTE *The **usbdrive0** parameter is only valid for units with Universal Serial Bus (USB) flash drive capabilities.*

Syntax Description

cflash	Specifies that the configuration file is located in CompactFlash memory.
flash	Specifies that the configuration file is located in flash memory.
usbdrive0	Specifies that the configuration file is located in USB flash drive memory.
<*primary filename*>	Specifies the name of the primary configuration file (file names are case sensitive).
<*secondary filename*>	Optional. Specifies the name of the backup configuration file.

Default Values

No default values are necessary for this command.

Command History

Release 14.1	Command was introduced.
Release 18.2	Command was expanded to include USB flash drive memory.

Usage Examples

The following example specifies the file **myconfig.biz** (located in flash memory) as the primary system boot file:

(config)**#boot config flash myconfig.biz**

The following example specifies the file **myconfig.biz** (located in flash memory) as the primary system boot file and the file **mybackupconfig.biz** (located in CompactFlash memory) as the backup configuration file:

(config)**#boot config flash myconfig.biz cflash mybackupconfig.biz**

boot system

Use the **boot system** command to specify the system image loaded at startup. Variations of this command include:

boot system cflash <*primary filename*>
boot system cflash <*primary filename*> **verify**
boot system cflash <*primary filename*> **cflash** <*secondary filename*>
boot system cflash <*primary filename*> **cflash** <*secondary filename*> **verify**
boot system cflash <*primary filename*> **flash** <*secondary filename*>
boot system cflash <*primary filename*> **flash** <*secondary filename*> **verify**
boot system cflash <*primary filename*> **no-backup**
boot system cflash <*primary filename*> **no-backup verify**
boot system flash <*primary filename*>
boot system flash <*primary filename*> **verify**
boot system flash <*primary filename*> <*secondary filename*>
boot system flash <*primary filename*> <*secondary filename*> **verify**
boot system flash <*primary filename*> **cflash** <*secondary filename*>
boot system flash <*primary filename*> **cflash** <*secondary filename*> **verify**
boot system flash <*primary filename*> **flash** <*secondary filename*>
boot system flash <*primary filename*> **flash** <*secondary filename*> **verify**
boot system flash <*primary filename*> **no-backup**
boot system flash <*primary filename*> **no-backup verify**
boot system flash <*primary filename*> **usbdrive0** <*secondary filename*>
boot system flash <*primary filename*> **usbdrive0** <*secondary filename*> **verify**
boot system usbdrive0 <*primary filename*>
boot system usbdrive0 <*primary filename*> **verify**
boot system usbdrive0 <*primary filename*> **flash** <*secondary filename*>
boot system usbdrive0 <*primary filename*> **flash** <*secondary filename*> **verify**
boot system usbdrive0 <*primary filename*> **no-backup**
boot system usbdrive0 <*primary filename*> **no-backup verify**
boot system usbdrive0 <*primary filename*> **usbdrive0** <*secondary filename*>
boot system usbdrive0 <*primary filename*> **usbdrive0** <*secondary filename*> **verify**

*The **cflash** parameter is only valid for units with CompactFlash® capabilities.*

*For units without CompactFlash capabilities, the secondary media type does not need to be specified. Refer to the last example under **Usage Examples**.*

*The **usbdrive0** parameter is only valid for units with Universal Serial Bus (USB) flash drive capabilities.*

Syntax Description

cflash	Specifies the system image is located in CompactFlash memory.
flash	Specifies the system image is located in flash memory.
no-backup	Specifies that there is no backup image present.
<primary filename>	Specifies the file name of the image (file names are case sensitive). Image files should have a .biz extension.
<secondary filename>	Specifies a name for the backup image.
verify	Optional. Verifies the image checksum.
usbdrive0	Specifies the system image is located in USB flash drive memory.

Default Values

No default values are necessary for this command.

Command History

Release 1.1	Command was introduced.
Release 12.1	Command was expanded to include CompactFlash.
Release 18.2	Command was expanded to include USB flash drive memory.
Release R12.1.0	Command version **boot system flash** was made unavailable for virtual AOS (vAOS) instances.

Functional Notes

Detailed instructions for upgrading AOS and loading files into flash memory are found online at http://supportforums.adtran.com.

The **boot system flash** command is not available in vAOS instances.

Usage Examples

The following example specifies **myimage.biz** (located in CompactFlash memory) as the primary image file with no backup image:

(config)**#boot system cflash myimage.biz no-backup**

The following example specifies **myimage.biz** (located in flash memory) as the primary image file with no backup image:

(config)**#boot system flash myimage.biz no-backup**

The following example specifies **myimage.biz** (located in flash memory) as the primary image file and **mybackupimage.biz** (also located in flash memory) as the backup image:

(config)#**boot system flash myimage.biz mybackupimage.biz**

boot voip

Use the **boot voip** command to specify the VoIP image file loaded at startup. Variations of this command include:

boot voip default
boot voip flash <*filename*>

Syntax Description

default	Uses default VoIP image.
flash <*filename*>	Specifies the file name (located in flash memory) of the image (file names are case sensitive). Image files should have a .biz extension.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.

Functional Notes

Detailed instructions for upgrading AOS and loading files into flash memory are found online at https://supportcommunity.adtran.com.

Usage Examples

The following example specifies the file **myimage.biz**, stored in flash memory, as the VoIP startup image:

(config)**#boot voip flash myimage.biz**

bridge irb

Use the **bridge irb** command to enable integrated routing and bridging (IRB) and also allow the creation of bridged virtual interfaces (BVIs). Use the **no** form of this command to disable the IRB.

Syntax Description

No subcommands.

Default Values

By default, IRB is disabled.

Command History

Release 15.1	Command was introduced.

Functional Notes

The **bridge irb** *must* be enabled to create BVIs.

Once the command **bridge irb** is entered, the IP addresses for any interfaces connected to *any* bridge will be removed. Also, the command **ip address xx.xx.xx.xx.xx.xx.xx.xx** will no longer be available on an interface that is connected to the bridge.

The BVI must be removed before using the **no bridge irb** command.

For more information on BVI configuration, refer to the *BVI Interface Command Set on page 2593*.

Usage Examples

The following example enables IRB:

(config)**#bridge irb**

Technology Review

The IRB allows the routing of specified protocols between network interfaces and bridge groups. The difference between IRB and concurrent routing and bridging (CRB) is that in IRB it is possible to route IP between routed interfaces and BVIs, but with CRB the routed interfaces cannot communicate with bridged interfaces. IRB's primary goal is to bridge all protocols and route any IP traffic destined for the medium access control (MAC) address of the BVI.

The IRB handles IP packets in the following manner: When an IP packet comes into the router and it is not destined for the MAC address, it is bridged. If the IP packet is destined for the MAC address, it is sent to the routing engine and routed as normal. The IRB allows for PCs in the bridge to get to routed networks and routed networks to get to the bridge. The bridge group will isolate broadcasts from other routed interfaces.

A BVI can only be created when IRB is enabled and a bridge group has been defined. The BVI number corresponds directly to the bridge group.

When IRB *is* enabled and a BVI is configured, IP network configuration is removed for all bridged interfaces. IP traffic destined for the BVI address is delivered to the local IP stack for routing (if routing is enabled) or management. If no BVI is configured, the behavior is the same as if IRB is not enabled.

When IRB is *not* enabled, a BVI cannot be created. Bridged interfaces retain their IP configuration, and IP traffic destined for those interfaces is delivered to the local IP stack.

bridge <*number*> protocol ieee

The **bridge protocol ieee** command configures a bridge group for the IEEE 802.1 Ethernet spanning-tree protocol. Use the **no** form of this command (with the appropriate arguments) to delete this setting.

Syntax Description

<*number*>	Specifies a bridge group number. Range is **1** to **255**.

Default Values

By default, all configured bridge interfaces implement IEEE spanning-tree protocol.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example deletes the bridge protocol setting for bridge group **17**:

(config)**#no bridge 17 protocol ieee**

clock

The **clock auto-correct-DST** command allows the unit to automatically correct for daylight savings time (DST). Use the **clock no-auto-correct-DST** command to disable this feature. Variations of this command include:

clock auto-correct-DST
clock no-auto-correct-DST

Syntax Description

auto-correct-DST	Configures the unit to automatically correct for DST.
no-auto-correct-DST	Disables DST correction.

Default Values

By default, DST correction takes place automatically.

Command History

Release 6.1	Command was introduced.
Release 11.1	Command was added to the Global command set.

Functional Notes

Depending on the **clock timezone** chosen (refer to *clock timezone <value> on page 1234* for more information), one-hour DST correction may be enabled automatically. You may override this default using this command.

Usage Examples

The following example allows for automatic DST correction:

(config)**#clock auto-correct-DST**

The following example overrides the one-hour offset for DST:

(config)**#clock no-auto-correct-DST**

clock set *<time> <day> <month> <year>*

Use the **clock set** command to configure the system software clock. For the command to be valid, all fields must be entered. Refer to the *Usage Examples* below for an example.

Syntax Description

<time>	Sets the time (in 24-hour format) of the system software clock in the format hours:minutes:seconds (HH:MM:SS).
<day>	Sets the current day of the month. Valid range is **1** to **31**.
<month>	Sets the current month. Valid range is **January** to **December**. You need only enter enough characters to make the entry unique. This entry is not case sensitive.
<year>	Sets the current year. Valid range is **2000** to **2100**.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 11.1	Command was added to the Global command set.

Usage Examples

The following example sets the system software clock for 3:42 pm, August 22 2004:

(config)**#clock set 15:42:00 22 Au 2004**

clock timezone <*value*>

The **clock timezone** command sets the unit's internal clock to the time zone of your choice. This setting is based on the difference in time (in hours) between Greenwich Mean Time (GMT) or Central Standard Time (CST) and the time zone for which you are setting up the unit. Use the **no** form of this command to disable this feature.

Syntax Description

<*value*>	Time zone values are specified in the *Functional Notes* section for this command.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.

*Depending on the **clock timezone** chosen, one-hour daylight savings time (DST) correction may be enabled automatically. Refer to the command* *clock on page 1232* *for more information.*

Functional Notes

The following list shows sample cities and their time zone codes.

clock timezone +1-Amsterdam
clock timezone +1-Belgrade
clock timezone +1-Brussels
clock timezone +1-Sarajevo
clock timezone +1-West-Africa
clock timezone +10-Brisbane
clock timezone +10-Canberra
clock timezone +10-Guam
clock timezone +10-Hobart
clock timezone +10-Vladivostok
clock timezone +11
clock timezone +12-Auckland
clock timezone +12-Fiji
clock timezone +13
clock timezone +2-Athens
clock timezone +2-Bucharest
clock timezone +2-Cairo
clock timezone +2-Harare
clock timezone +2-Helsinki
clock timezone +2-Jerusalem
clock timezone +3-Baghdad
clock timezone +3-Kuwait
clock timezone +3-Moscow
clock timezone +3-Nairobi
clock timezone +3:30
clock timezone +4-Abu-Dhabi
clock timezone +4-Baku
clock timezone +4:30
clock timezone +5-Ekaterinburg
clock timezone +5-Islamabad
clock timezone +5:30
clock timezone +5:45
clock timezone +6-Almaty
clock timezone +6-Astana
clock timezone +6-Sri-Jay
clock timezone +6:30
clock timezone +7-Bangkok
clock timezone +7-Kranoyarsk

clock timezone +8-Bejing
clock timezone +8-Irkutsk
clock timezone +8-Kuala-Lumpur
clock timezone +8-Perth
clock timezone +8-Taipei
clock timezone +9-Osaka
clock timezone +9-Seoul
clock timezone +9-Yakutsk
clock timezone +9:30-Adelaide
clock timezone +9:30-Darwin
clock timezone -1-Azores
clock timezone -1-Cape-Verde
clock timezone -10
clock timezone -11
clock timezone -12
clock timezone -2
clock timezone -3-Brasilia
clock timezone -3-Buenos-Aires
clock timezone -3-Greenland
clock timezone -3:30
clock timezone -4-Atlantic-Time
clock timezone -4-Caracus
clock timezone -4-Santiago
clock timezone -5
clock timezone -5-Bogota
clock timezone -5-Eastern-Time
clock timezone -6-Central-America
clock timezone -6-Central-Time
clock timezone -6-Mexico-City
clock timezone -6-Saskatchewan
clock timezone -7-Arizona
clock timezone -7-Mountain-Time
clock timezone -8
clock timezone -9
clock timezone -0-Universal Coordinated Time (UTC)
clock timezone GMT-Casablanca
clock timezone GMT-Dublin

Usage Examples

The following example sets the time zone for Santiago, Chile.

>**enable**
(config)#**clock timezone -4-Santiago**

community-list *<name>*

Use the **community-list** command to create a community list for Border Gateway Protocol (BGP) route map use. Use the **no** form of this command to delete a community list.

Syntax Description

<name>	Specifies the name of the community to use in the community list attribute for BGP routes. Refer to *Community List Command Set on page 4058* for more information on the available options.

Default Values

By default, this command is disabled.

Command History

Release 9.3	Command was introduced.

Usage Examples

The following example creates a community list **MyList** and enters the Community List Configuration mode:

(config)**#community-list MyList**
(config-comm-list)**#**

counter-profile <*slot/index*>

Use the **counter-profile** command to create a counter-profile and enter the Counter Profile Configuration mode. Use the **no** form of this command to remove the counter profile.

Syntax Description

<*slot/index*>	Specifies the index of the counter-profile in the format <*slot/index*>. For example, **0/1**.

Default Values

By default, no counter-profiles exist.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example creates counter profile **0/1** and enters the Counter Profile Configuration mode:

(config)**#counter-profile 0/1**
(config-count-prof 0/1)**#**

quit
Hash: 4e904504dc4e5b95e08129430e2a0b97ceef0ad1394f905b42df2dfb8f751be0244a711bb0
6eddaa2f07dd640c187f14c16fa0bed28e038b28b6741a880539d6ed06a68b7e324bfdde6f3d0b17

ffc430e177623720de56f4
* Do you accept this certificate? [y]**y**

crypto ca authenticate *<profile name>*

Use the **crypto ca authenticate** command to initiate certificate authority (CA) authentication procedures. Variations of this command include:

crypto ca authenticate *<profile name>*
crypto ca authenticate *<profile name> <drive> <name>*

Syntax Description

<profile name>	Specifies a CA profile using an alphanumeric string up to 32 characters.
<drive> <name>	Optional. Specifies the certificate to be authenticated is loaded from a file identified by it's location (*<drive>*), such as **nonvol**, **cflash**, etc., and the name of the file (*<name>*). This bypasses the terminal loading process.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release R11.5.0	Command was expanded to include the *<drive>* and *<name>* parameters.

Functional Notes

The type of authentication procedure is based on the **enrollment** command and its settings. Refer to *enrollment terminal on page 5213* and *enrollment url <url> on page 5214* for more information. When **enrollment** is set to **terminal**, the CA authentication process is done manually, as shown in several of the following *Usage Examples*.

Usage Examples

The following example initiates the CA authentication process for manual enrollment:

(config)**#crypto ca authenticate testCAprofile**

Enter the base 64 encoded CA certificate. End with two consecutive carriage returns or the word "quit" on a line by itself:

-----BEGIN X509 CERTIFICATE-----

ffc430e177623720de56f4
* Do you accept this certificate? [y]**y**

The following example initiates CA authentication for a specific file, locally stored on the AOS device, and bypasses the terminal loading process for the file:

(config)**#crypto ca authenticate MYPROFILE nonvol CA.pem**

crypto ca certificate chain <*name*>

Use the **crypto ca certificate chain** command to enter the Certificate Configuration for the specified certificate authority (CA). Refer to *Certificate Command Set on page 5221* for more information.

Syntax Description

<*name*>	Specifies a CA profile using an alphanumeric string (up to 32 characters).

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Functional Notes

Typically used only in the **running-config** and **startup-config** to restore certificates.

Usage Examples

The following example enters the Certificate Configuration mode for the CA profile **MyProfile**:

(config)**#crypto ca certificate chain MyProfile**

crypto ca enroll <*profile name*>

Use the **crypto ca enroll** command to begin certificate authority (CA) enrollment procedures. Use the **no** form of this command to disable this feature. Variations of this command include:

crypto ca enroll <*profile name*>
crypto ca enroll <*profile name*> **force-overwrite**
crypto ca enroll <*profile name*> <*drive*> <*name*>
crypto ca enroll <*profile name*> <*drive*> <*name*> **force-overwrite**

Syntax Description

<*profile name*>	Specifies a CA profile using an alphanumeric string (up to 32 characters).
<*drive*> <*name*>	Optional. Specifies the certificate to be enrolled is loaded from a file identified by it's location (<*drive*>), such as **nonvol**, **cflash**, etc., and the name of the file (<*name*>). This bypasses the terminal loading process.
force-overwrite	Optional. Instructs the AOS device to overwrite any existing file with the same name. If the <*drive*> and <*name*> parameters are not specified, the enrollment dialog prompts you to indicate if the certificate request should be written to a file, and if yes, the drive and filename to use. If the certificate request is not saved to file, the keys remain and the request is discarded.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release R11.5.0	Command was expanded to include the <*drive*>, <*name*>, and **force-overwrite** parameters.

Functional Notes

The type of enrollment procedure is based on the **enrollment** command and its settings. Refer to *enrollment terminal on page 5213* and *enrollment url <url> on page 5214* for more information. This command initiates a dialog that is used to fill in the parameters that make up an enrollment request to be forwarded to a certificate authority. Note that some of the parameters (such as IP address) may be filled in using the values supplied in the **crypto ca profile** (in which case, the enrollment dialog will not prompt for those parameters). Once all required parameters are defined using the dialog, this command assembles them into an enrollment request to be sent to a certificate authority (including the generation of public and private keys). Refer to *crypto ca profile <name> on page 1246* for more information.

If **enrollment** is set to **terminal**, you may view the request on the terminal screen.

If **enrollment** is set to **url**, the request is sent automatically to the certificate authority using the uniform resource locator (URL) specified by the **enrollment url** command.

Usage Examples

The following example shows a typical enrollment dialog:

(config)**#crypto ca enroll MyProfile**
**** Press CTRL+C to exit enrollment request dialog. ****
* Enter signature algorithm (RSA or DSS) [rsa]:**rsa**
* Enter the modulus length to use [512]:**1024**
* Enter the subject name as an X.500 (LDAP) DN:**CN=Router,C=US,L=Huntsville,S=AL**
--The subject name in the certificate will be CN=CN=Router,C=US,L=Huntsville,S=AL.
* Include an IP address in the subject name [n]:**y**
* Enter IP address or name of interface to use:**10.200.1.45**
* Include fully qualified domain name [n]:**y**
* Enter the fully qualified domain name to use:**FullyQualifiedDomainName**
* Include an email address [n]:**y**
* Enter the email address to use:**myEmail@adtran.commyemail@email.com**
Generating request (including keys).

The following example creates a CA certificate and begins the enrollment process using a locally stored file:

(config)**#crypto ca enroll MYPROFILE novol SELF.csr force-overwrite**

crypto ca import <*profile name*> certificate

Use the **crypto ca import certificate** command to import a certificate manually via the console terminal. Variations of this command include:

crypto ca import <*profile name*> **certificate**
crypto ca import <*profile name*> **certificate** <*drive*> <*name*>

Syntax Description

<*profile name*>	Specifies a certificate authority (CA) profile using an alphanumeric string (up to 32 characters).
<*drive*> <*name*>	Optional. Specifies the certificate to be imported is loaded from a file identified by it's location (<*drive*>), such as **nonvol**, **cflash**, etc., and the name of the file (<*name*>). This bypasses the terminal loading process.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release R11.5.0	Command was expanded to include the <*drive*> and <*name*> parameters.

Functional Notes

Puts command line interface (CLI) in mode where the certificate can be entered manually. Enter **quit** and a carriage return (or simply enter two consecutive carriage returns) to exit this mode. Abort this mode by pressing **Ctrl-C**. This command only applies if the **enrollment** command is set to **terminal**. Refer to *enrollment terminal on page 5213*.

Usage Examples

The following example imports a certificate via the console terminal:

(config)**#crypto ca import MyProfile certificate**
Enter the PM-encoded certificate. End with two consecutive
carriage returns or the word "quit" on a line by itself:
-----BEGIN CERTIFICATE-----
MIIDWTCCAwOgAwIBAgIKFLCsOgAAAAAAtjANBgkqhkiG9w0BAQUFADBjMQswCQYD

-----END CERTIFICATE-----
Success!

The following example specifies that locally stored **SELF.pem** is imported for CA profile **MYPROFILE**:

(config)**#crypto ca import MYPROFILE certificate nonvol SELF.pem**

crypto ca import <*profile name*> crl

Use the **crypto ca import crl** command to import a certificate revocation list (CRL) manually via the console terminal. Variations of this command include:

crypto ca import <*profile name*> **crl**
crypto ca import <*profile name*> **crl** <*drive*> <*name*>

Syntax Description

<*profile name*>	Specifies a certificate authority (CA) profile using an alphanumeric string (up to 32 characters).
<*drive*> <*name*>	Optional. Specifies the certificate to be imported is loaded from a file identified by it's location (<*drive*>), such as **nonvol**, **cflash**, etc., and the name of the file (<*name*>). This bypasses the terminal loading process.

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.
Release R11.5.0	Command was expanded to include the <*drive*> and <*name*> parameters.

Functional Notes

Puts command line interface (CLI) in a mode where the CRL can be entered manually. Enter **quit** and a carriage return (or simply enter two consecutive carriage returns) to exit this mode. This command only applies if the **enrollment** command is set to **terminal**. Refer to *enrollment terminal on page 5213*.

Usage Examples

The following example allows you to manually paste in the CA's CRL:

(config)**#crypto ca import MYPROFILE crl**

The following example allows you to paste a locally stored file into the CA's CRL:

(config)**#crypto ca import MYPROFILE crl nonvol SELF.pem**

crypto ca profile *<name>*

Use the **crypto ca profile** command to define a certificate authority (CA) and to enter the CA Profile Configuration. Use the **no** form of this command to disable this feature. Refer to *CA Profile Command Set on page 5209* for more information.

Syntax Description

<name>	Creates a CA profile using an alphanumeric string (up to 32 characters).

Default Values

No default values are necessary for this command.

Command History

Release 5.1	Command was introduced.

Functional Notes

Use this to specify the type of enrollment, as well as enrollment request parameters. Refer to the *Functional Notes* of the command *crypto ca enroll <profile name> on page 1241* for more information.

Usage Examples

The following example creates the CA profile called **MyProfile** and enters the CA Profile Configuration for that certificate authority:

```
(config)#crypto ca profile MyProfile
Configuring New CA Profile MyProfile.
(ca-profile)#
```

crypto ike

Use the **crypto ike** command to define the system-level local ID for Internet key exchange (IKE) negotiations and to enter the IKE Client or IKE Policy command sets. Use the **no** form of this command to disable these features. Variations of this command include the following:

crypto ike client configuration pool <*name*>
crypto ike local-id address
crypto ike policy <*value*>

Syntax Description

client configuration pool <*name*>	Creates a local pool, assigns it the name of your choice and enters the IKE Client command set. Clients that connect via an IKE policy that specifies this pool name will be assigned values from this pool. Refer to the section *IKE Policy Command Set on page 5280* for more information.
local-id address	Sets the local ID during IKE negotiation to be the IP address of the interface from which the traffic exits. This setting can be overridden on a per-policy basis using the **local-id** command. Refer to *local-id on page 5287* for more information.
policy <*value*>	Creates an IKE policy, assigns the sequence number value of your choice, and enters the IKE Policy command set. Refer to section *IKE Policy Command Set on page 5280* for more information.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.

Usage Examples

The following example creates an IKE policy with a policy priority setting of 1 and enters the IKE Policy for that policy:

(config)**#crypto ike policy 1**

Technology Review

The following example configures an AOS product for virtual private network (VPN) using IKE aggressive mode with preshared keys (PSKs). The AOS product can be set to initiate IKE negotiation in main mode or aggressive mode. The product can be set to respond to IKE negotiation in main mode, aggressive mode, or any mode. In this example, the device is configured to initiate in aggressive mode and to respond to any mode.

This example assumes that the AOS product has been configured with a wide area network (WAN) IP address of **63.97.45.57** on interface **ppp 1** and a local area network (LAN) IP address of **10.10.10.254** on interface **ethernet 0/1**. The peer private IP Subnet is **10.10.20.0**.

Step 1:
Enter the Global Configuration mode (i.e., config terminal mode).

>**enable**
#configure terminal

Step 2:
Enable VPN support using the **ip crypto** command. This command allows crypto maps to be applied to interfaces, and enables the IKE server to listen for IKE negotiation sessions on User Datagram Protocol (UDP) port 500.

(config)**#ip crypto**

Step 3:
Set the local ID. During IKE negotiation, local IDs are exchanged between the local device and the peer device. In AOS, the default setting for all local IDs are configured by the **crypto ike local-id** command. The default setting is for all local IDs to be the IPv4 address of the interface over which the IKE negotiation is occurring. In the future, a unique system-wide host name or fully qualified domain name (FQDN) could be used for all IKE negotiation.

(config)**#crypto ike local-id address**

Step 4:
Create IKE policy. In order to use IKE negotiation, an IKE policy must be created. Within the system, a list of IKE policies is maintained. Each IKE policy is given a priority number in the system. That priority number defines the position of that IKE policy within the system list. When IKE negotiation is needed, the system searches through the list, starting with the policy with priority of 1, looking for a match to the peer IP address.

An individual IKE policy can override the system local ID setting by having the **local-id** command specified in the IKE policy definition. This command in the IKE policy is used to specify the type of local ID and the local ID data. The type can be of IPv4 address, FQDN, or user-specified FQDN.

An IKE policy may specify one or more peer IP addresses that will be allowed to connect to this system. To specify multiple unique peer IP addresses, the **peer A.B.C.D** command is used multiple times within a single IKE policy. To specify that all possible peers can use a default IKE policy, the **peer any** command is given instead of the **peer A.B.C.D** command inside of the IKE policy. The policy with the **peer any** command specified will match to any peer IP address (and, therefore, should be given the highest numerical priority number). This will make the policy the last one to be compared against during IKE negotiation.

(config)**#crypto ike policy 10**
(config-ike)**#no local-id**
(config-ike)**#peer 63.105.15.129**
(config-ike)**#initiate aggressive**
(config-ike)**#respond anymode**
(config-ike)**#attribute 10**
(config-ike-attribute)**#encryption 3des**
(config-ike-attribute)**#hash sha**
(config-ike-attribute)**#authentication pre-share**
(config-ike-attribute)**#group 1**
(config-ike-attribute)**#lifetime 86400**

Step 5:
Define the remote ID settings. The **crypto ike remote-id** command is used to define the remote ID for a peer connecting to the system, specify the preshared key associated with the specific remote ID, and (optionally) determine that the peer matching this remote ID should not use mode config (by using the **no-mode-config** keyword). Refer to *crypto ike remote-id on page 1251* for more information.

(config)**#crypto ike remote-id address 63.105.15.129 preshared-key mysecret123**

Step 6:
Define the transform-set. A transform set defines the encryption and/or authentication algorithms to be used to secure the data transmitted over the VPN tunnel. Multiple transform sets may be defined in a system. Once a transform set is defined, many different crypto maps within the system can reference it. In this example, a transform set named **highly_secure** has been created. This transform set defines encapsulating security payload (ESP) with authentication implemented using 3DES encryption and SHA1 authentication.

(config)**#crypto ipsec transform-set highly_secure esp-3des esp-sha-hmac**
(cfg-crypto-trans)**#mode tunnel**

Step 7:
Define an IP access list. An extended access control list (ACL) is used to specify which traffic needs to be sent securely over the VPN tunnel. The entries in the list are defined with respect to the local system. The source IP address will be the source of the traffic to be encrypted. The destination IP address will be the receiver of the data on the other side of the VPN tunnel.

(config)**#ip access-list extended corporate_traffic**
(config-ext-nacl)**#permit ip 10.10.10.0 0.0.0.255 10.10.20.0 0.0.0.255 log deny ip any any**

Step 8:
Create crypto map. A crypto map is used to define a set of encryption schemes to be used for a given interface. A crypto map entry has a unique index within the crypto map set. The crypto map entry will specify whether IKE is used to generate encryption keys or if manually specified keys will be used. The crypto map entry will also specify who will be terminating the VPN tunnel, as well as which transform set or sets will be used to encrypt and/or authenticate the traffic on that VPN tunnel. It also specifies the lifetime of all created IPSec security associations (SAs).

(config)**#crypto map corporate_vpn 1 ipsec-ike**
(config-crypto-map)**#match address corporate_traffic**
(config-crypto-map)**#set peer 63.105.15.129**
(config-crypto-map)**#set transform-set highly_secure**
(config-crypto-map)**#set security-association lifetime kilobytes 8000**
(config-crypto-map)**#set security-association lifetime seconds 28800**
(config-crypto-map)**#no set pfs**

Step 9:
Configure a public interface. This process includes configuring the IP address for the interface and applying the appropriate crypto map to the interface. Crypto maps are applied to the interface on which encrypted traffic will be transmitted.

(config)**#interface ppp 1**
(config-ppp 1)**#ip address 63.97.45.57 255.255.255.248**
(config-ppp 1)**#crypto map corporate_vpn**
(config-ppp 1)**#no shutdown**

Step 10:
Configure a private interface. This process allows all traffic destined for the VPN tunnel to be routed to the appropriate gateway.

(config)**#interface ethernet 0/1**
(config-eth 0/1)**#ip address 10.10.10.254 255.255.255.0**
(config-eth 0/1)**#no shutdown**
(config-eth 0/1)**#exit**

crypto ike remote-id

Use the **crypto ike remote-id** command to specify the remote ID and to associate a preshared key with the remote ID. Use the **no** form of this command to disable these features. Variations of this command include the following:

crypto ike remote-id address <*ip address*>
crypto ike remote-id address <*ip address*> <*option*>
crypto ike remote-id any
crypto ike remote-id any <*option*>
crytpo ike remote-id asn1-dn <*name*>
crypto ike remote-id asn1-dn <*name*> <*option*>
crypto ike remote-id fqdn <*name*>
crypto ike remote-id fqdn <*name*> <*option*>
crypto ike remote-id user-fqdn <*name*>
crypto ike remote-id user-fqdn <*name*> <*option*>

*The AOS virtual private network (VPN) feature must be enabled (using the **ip crypto** command) for the VPN tunnel to be activated.*

Syntax Description

address <*ip address*>	Specifies a valid remote IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
any	Allows any remote ID (type and value).
asn1-dn <*name*>	Specifies an abstract syntax notation distinguished name as the remote ID (enter this value in (Lightweight Directory Access Protocol (LDAP) format).
fqdn <*name*>	Specifies a fully qualified domain name (FQDN) (e.g., **adtran.com**) as the remote ID.
user-fqdn <*name*>	Specifies a user FQDN or email address (e.g., **user1@adtran.com**) as the remote ID.
<*option*>	Specifies an optional parameter corresponding to this remote ID. Optional parameters include the following list:
<*wildcard mask*>	Optional. Specifies the wildcard mask that corresponds to a range of IP addresses (network) or a specific host. Wildcard masks are expressed in dotted decimal notation (for example, **0.0.0.255**).
crypto map <*name*> <*number*>	Optional. Specifies the crypto map name and sequence number this remote ID corresponds to.
ike policy <*value*>	Optional. Specifies the Internet key exchange (IKE) policy sequence number value this remote ID corresponds to.
preshared-key <*key*>	Optional. Associates a preshared key with this remote ID.

no-mode-config	Optional. Specifies that the peer matching this remote ID should not use mode config.
no-xauth	Optional. Specifies that the peer matching this remote ID should not use Xauth.
nat-t [v1 l v2] [allow l force l disable]	Optional. Denotes whether peers matching this remote ID should allow, disable, or force network address translation (NAT) traversal versions 1 or 2.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release 5.1	Command was expanded to include the **any**, **asn1-dn**, and **no-xauth** subcommands.
Release 7.1	Command was expanded to include the NAT traversal commands.

Functional Notes

The **fqdn** and **user-fqdn** <*fqdn*> line can include wildcard characters. The wildcard characters are "*****" for a 0 or more character match and "?" for a single character match. Currently, the "?" cannot be set up using the command line interface (CLI), but it can be transferred to the unit via the startup-config.

Example for **user-fqdn**:

john*@domain.com

will match:

johndoe@domain.com
johnjohn@adtran.comjohnjohn@myemail.com
john@adtran.comjohn@myemail.com

Example for **fqdn**:

***.domain.com**

will match:

www.domain.com
ftp.domain.com
one.www.domain.com

The **address** remote ID can be in the form of a single host address or in the form of an IP address wildcard.

Example for **address** type:

crypto ike remote id address 10.10.10.0 0.0.0.255

will match:

10.10.10.1
10.10.10.2
and all IP addresses in the form of 10.10.10.X (where X is 0 to 255)

The **asn1-dn** <*name*> line can include wildcard characters. The wildcard characters are "*" for a 0 or more character match and "?" for a single character match. Currently, the "?" cannot be set up using the CLI, but it can be transferred to the unit via the startup-config.

Example for typical **asn1-dn** format with no wildcards:

crypto ike remote-id asn1-dn "CN=MyRouter, C=US, S=ALCA, L=Huntsville, O=Adtran, OU=TechSupport"
(matches only remote ID strings with all fields exactly the same)

Example for typical **asn1-dn** format with wildcards used to match a string within a field:

crypto ike remote-id asn1-dn "CN=*, C=*, S=*, L=*, O=*, OU=*"
(matches any asn1-dn remote ID string from a peer)

Example for typical **asn1-dn** format with wildcards used to match a portion of the remote ID:

crypto ike remote-id asn1-dn "CN=*, C=US, S=ALCA, L=Huntsville, O=Adtran, OU=*"
(matches any remote ID string with the same values for the C, S, L, and O fields, and any values in the CN and OU fields)

Example for typical **asn1-dn** format with wildcards used to match a portion of a field:

crypto ike remote-id asn1-dn "CN=My*, C=US, S=ALCA, L=Huntsville, O=Adtran, OU=TechSupport"
(matches remote ID strings with all fields exactly the same, but with any CN field beginning with "My")

Usage Examples

The following example assigns a remote ID of 63.97.45.57 and associates the preshared key **mysecret** with the remote ID:

(config)**#crypto ike remote-id address 63.97.45.57 preshared-key mysecret**

data-call

Use the **data-call** command to set the preauthentication defaults for inbound demand routing calls. Use the **no** form of this command to return to the default setting. Variations of this command include:

data-call authentication protocol chap
data-call authentication protocol pap
data-call mtu <*number*>
data-call multilink
data-call sent authentication protocol chap
data-call sent authentication protocol pap

Syntax Description

authentication protocol	Sets the authentication protocol expected for inbound calls. For more detailed information on Challenge-Handshake Authentication Protocol (CHAP) and Password Authentication Protocol (PAP), refer to the *Technology Review* section of the command *ppp authentication on page 3192*.
chap	Configures CHAP authentication.
pap	Configures PAP authentication.
mtu <*number*>	Sets the maximum size for the transmit unit. Valid range is **64** to **1520**. Refer to the command *peer default ip address <ipv4 address> on page 3190* for more detailed syntax descriptions.
multilink	Enables the negotiation of multilink maximum receive unit (MRU) size for inbound calls.
sent authentication protocol	Sets the authentication protocol sent for inbound calls. For more detailed information on CHAP and PAP, refer to the *Technology Review* section of the command *ppp authentication on page 3192*.

Default Values

By default, the authentication protocol is not configured, multilink is disabled, and the maximum transmission unit (MTU) size is 1500.

Command History

Release 11.1	Command was introduced.

Functional Notes

There are certain Point-to-Point Protocol (PPP) parameters that must be known before PPP can negotiate an inbound call when using demand routing. To ensure PPP convergence, it is recommended (in most cases) that demand routing interfaces use the same settings as those specified in the **data-call** commands. The **data-call mtu** <*number*> command sets the MTU and controls the negotiated MRU size during incoming calls for Link Control Protocol (LCP) negotiation. If the PPP parameters do not match the authenticated user, the link is renegotiated.

Usage Examples

The following example sets the authentication protocol expected for incoming calls to CHAP. The router will then authenticate the peer using CHAP:

(config)**#data-call authentication protocol chap**

The following example specifies an MTU of 1200 on the demand routing interface:

(config)**#data-call mtu 1200**

data-plane cpu mode

Use the **data-plane cpu mode** command to specify the mode in which virtual AOS (vAOS) operates on the central processing unit (CPU) of the host server. Use the **no** form of this command to return to the default setting. Variations of this command include:

data-plane cpu mode shared
data-plane cpu mode dedicated

Syntax Description

shared	Specifies that vAOS shares the data forwarding plane CPU with other processes.
dedicated	Specifies that vAOS does not share the data forwarding plane CPU with other processes.

Default Values

By default, the vAOS CPU mode is set to **shared**.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

The **shared** mode is useful when other processes on the CPU must take priority over a vAOS instance, or when multiple vAOS instances are stacked on a set of CPUs. Setting the vAOS mode to **shared** may result in lower throughput. The **dedicated** mode is useful when the data forwarding plane CPU does not need to be shared or when maximizing throughput.

Usage Examples

The following example specifies that vAOS does not share the data forwarding plane CPU with any other processes:

(config)**#data-plane cpu mode dedicated**

desktop-auditing dhcp

Use the **desktop-auditing dhcp** command to enable desktop auditing. Using the **no** form of this command disables desktop auditing.

Syntax Description

No subcommands.

Default Values

By default, desktop auditing is disabled.

Command History

Release 17.8	Command was introduced.

Functional Notes

Desktop auditing is an AOS feature that collects network access protection (NAP) information through NAP messages sent in Dynamic Host Configuration Protocol (DHCP) messages between clients connected to the network and the network server.

Desktop auditing is configured by enabling the feature (using the **desktop-auditing dhcp** command) and by configuring filters to limit the output of the collected NAP information. Information is limited by specifying local desktop auditing policies. The configuration of these policies is outlined in *Desktop Auditing Local Policy Command Set on page 4395*. For more information about desktop auditing, refer to the *Configuring Desktop Auditing in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables the desktop auditing feature:

(config)**#desktop-auditing dhcp**

desktop-auditing local-policy

Use the **desktop-auditing local-policy** command to create a local policy for determining when connected network clients are violators of that policy. This command both creates the policy and enters the local policy configuration mode. Use the **no** form of this command to remove the local policy.

Command Syntax

No subcommands.

Default Values

By default, no local policies are configured and all network access protection (NAP) information for all clients is monitored.

Command History

Release 17.8	Command was introduced.

Functional Notes

Desktop auditing is an AOS feature that collects NAP information through NAP messages sent in Dynamic Host Configuration Protocol (DHCP) messages between clients connected to the network and the network server.

Desktop auditing is configured by enabling the feature (using the command *desktop-auditing dhcp on page 1257*) and by configuring filters to limit the output of the collected NAP information. Information is limited by specifying local desktop auditing policies. The local policy determines when a network access protection (NAP) client may be a violator by collecting NAP information for the connected clients and comparing them to the configured policies. You can choose to monitor the client's firewall state, antivirus state, antispyware status, auto-update status, and security update status. Selecting these policies filters the collected client information.

The configuration of these policies is outlined in *Desktop Auditing Local Policy Command Set on page 4395*. For more information about desktop auditing, refer to the *Configuring Desktop Auditing in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a desktop auditing local policy and enters the policy's configuration mode:

```
(config)#desktop-auditing local-policy
(desktop-audit-policy)#
```

desktop-auditing timeout <*days*>

Use the **desktop-auditing timeout** command to specify the amount of time that the AOS unit keeps network access protection (NAP) information collected through desktop auditing. Use the **no** form of this command to return to the default timeout period.

Syntax Description

<*days*>	Specifies the amount of time (in days) that desktop auditing stores collected NAP information. Range is **0** to **49710**.

Default Values

By default, desktop auditing is set to timeout in **0** days, meaning the collected NAP information is stored indefinitely.

Command History

Release 17.8	Command was introduced.

Functional Notes

Desktop auditing is an AOS feature that collects NAP information through NAP messages sent in Dynamic Host Configuration Protocol (DHCP) messages between clients connected to the network and the network server.

Desktop auditing is configured by enabling the feature (using the **desktop-auditing dhcp** command) and by configuring filters to limit the output of the collected NAP information. Information is limited by specifying local desktop auditing policies. The configuration of these policies is outlined in *Desktop Auditing Local Policy Command Set on page 4395*. For more information about desktop auditing, refer to the *Configuring Desktop Auditing in AOS* configuration guide available online at https://supportcommunity.adtran.com.

There is a storage limit of **2000** NAP entries on the AOS unit. When this limit is reached, new entries overwrite the old entries.

Usage Examples

The following example specifies that NAP information collected by desktop auditing will expire in **7** days:

(config)**#desktop-auditing timeout 7**

domain-list *<domain>*

Use the **domain-list** command to add an entry to the Domain Name Server (DNS) domain list. DNS appends the listed domains to a host name when attempting to resolve it. Use the **no** form of this command to remove the domain list entry. Variations of this command include:

domain-list <*domain*>
domain-list vrf <*name*> <*domain*>

Syntax Description

<*domain*>	Specifies the domain on which to create the domain list entry.
vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance on which to create the domain list entry. If no VRF is specified, the entry is created on the default VRF.

Default Values

By default, no domain list entries exist.

Command History

Release R10.9.0	Command was introduced.

Usage Examples

The following example creates a domain list entry for **DOMAIN1** on the default VRF instance:

(config)**#domain-list DOMAIN1**

domain-lookup

Use the **domain-lookup** command to enable and configure the IPv4 or IPv6 domain naming system (DNS), allowing DNS-based host translation (name-to-address). Use the **no** form of this command to disable DNS. Variations of this command include:

domain-lookup database local
domain-lookup database local ttl <*value*>
domain-lookup flush on-server-change
domain-lookup snmp trap first-failure
domain-lookup source-interface <*interface*>
domain-lookup vrf <*vrf name*> **source-interface** <*interface*>

Syntax Description

database local	Specifies that a local file of the DNS table is stored on the AOS device. This file is used to save the DNS table across a unit reboot.
ttl <*value*>	Optional. Specifies the time to live (TTL) value of the DNS file stored locally on the system. Valid range is **60** to **86400** seconds.
flush on-server-change	Specifies that the DNS cache is cleared when the set of configured and learned DNS servers has changed.
snmp trap first-failure	Specifies that Simple Network Management Protocol (SNMP) traps are used to send notifications when the first attempt at DNS resolution fails. In order to use SNMP traps for DNS resolution failure, you must also enable SNMP application traps using the command *snmp-server enable traps on page 1792*.
source-interface <*interface*>	Specifies an interface whose IP address will be used as the source IP address in a DNS request. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **domain-lookup source-interface ?** for a complete list of valid interfaces.
vrf <*vrf name*>	Optional. Specifies a nondefault VRF instance on which to change the source interface address for DNS requests. If no VRF instance is specified, the name server is added on the default unnamed VRF instance.

Default Values

By default, DNS is enabled; however, the **local**, **snmp trap**, and **source-interface** features of the domain lookup configuration are disabled by default. When the **local** DNS feature is enabled, the TTL value is **3600** seconds (one hour) by default.

Command History

Release 3.1	Command was introduced.

Release 18.3	Command syntax was changed to remove the **ip** keyword for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.
Release R10.3.0	Command was expanded to include the **local**, **snmp trap**, **source-interface**, and **vrf** parameters.
Release R13.2.0	Command was expanded to include the **flush on-server-change** parameter.

Functional Notes

Use the **domain-lookup** command to enable the DNS client in the router. This will allow the user to input Web addresses instead of IPv4 or IPv6 addresses for applications such as ping, Telnet, and traceroute.

Usage Examples

The following example enables DNS:

(config)**#domain-lookup**

The following example enables DNS and specifies that a local copy of the DNS table is saved on the AOS unit:

(config)**#domain-lookup local**

The following example enables DNS and DNS SNMP reporting:

(config)**#snmp-server enable traps application**
(config)**#domain-lookup snmp trap first-failure**

The following example enables DNS and specifies that the IP address of the **VLAN 1** interface on the VRF instance **RED** is used for DNS requests:

(config)#d**omain-lookup vrf RED source-interface vlan 1**

domain-name <*domain name*>

Use the **domain-name** command to define a default IPv4 or IPv6 domain name to be used by AOS to resolve host names. Use the **no** form of this command to disable this function. Variations of this command include:

domain-name <*domain name*>
domain-name vrf <*name*> <*domain name*>

Syntax Description

<*domain name*>	Specifies the default IPv4 or IPv6 domain name used to resolve unqualified host names. Do not include the initial period that separates the unresolved name from the default domain name.
vrf <*name*>	Optional. Specifies a nondefault virtual routing and forwarding (VRF) instance for the domain name.

Default Values

By default, this command is disabled.

Command History

Release 3.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command syntax was changed to remove the **ip** keyword for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Functional Notes

Use the **domain-name** command to set a default name that will be used to complete any IPv4 or IPv6 host name that is invalid (i.e., any name that is not recognized by the name server). When this command is enabled, any IPv4 or IPv6 host name that is not initially recognized will have the **domain-name** appended to it and the request will be re-sent.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Each VRF instance has its own domain name. Specifying a VRF name in the command applies the domain name to the named VRF. Issuing the command without specifying a VRF applies the command to the default unnamed VRF.

Usage Examples

The following example defines **adtran** as the default domain name:

(config)**#domain-name adtran**

The following example defines **adtran** as the default domain name for the VRF **RED**:

(config)**#domain-name vrf RED adtran**

domain-proxy

Use the **domain-proxy** command to enable domain naming system (DNS) proxy for the default virtual routing and forwarding (VRF) or for a specified VRF instance. This enables the router to act as a proxy for other units on the network. Use the **no** form of this command to disable this feature. Variations of this command include:

domain-proxy
domain-proxy failover
domain-proxy source-interface <*interface*>
domain-proxy vrf <*name*>
domain-proxy vrf <*name*> **failover**
domain-proxy vrf <*name*> **source-interface** <*interface*>

Syntax Description

failover	Enables DNS failover mode on the default domain proxy.
source-interface <*interface*>	Optional. Specifies the source interface for DNS packets. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; and for an ATM subinterface, use **atm 1.1**. Valid interfaces are those that can have an IP address. Type **source ?** for a complete list of valid interfaces.
vrf <*name*>	Optional. Specifies a nondefault VRF on which to enable DNS proxy.

Default Values

By default, this command is disabled.

Command History

Release 3.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 17.9	Command was expanded to include the **source-interface** parameter.
Release 18.2	Command was expanded to include the **failover** parameter.
Release 18.3	Command syntax was changed to remove the **ip** keyword for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.
Release R10.3.0	Command was expanded to include the **vrf** parameter for **source-interface** configurations.

Functional Notes

When this command is enabled, incoming DNS requests will be handled by the router. It will first search its host table for the query, and if it is not found there, the request will be forwarded to the servers configured with the command *name-server on page 1622*.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

DNS failover allows the AOS unit to respond to a DNS request if the unit cannot reach the configured DNS server and the entry exists in the unit's DNS table as a preserved value. DNS failover is typically used with the Voice of Internet Protocol (VoIP) name-server caching feature.

Usage Examples

The following example enables DNS proxy on the default VRF (router):

(config)**#domain-proxy**

dos-protection

Use the **dos-protection** command to enable and configure the denial of service (DoS) protection feature. Use the **no** form of this command to disable the DoS protection feature. Variations of this command include:

dos-protection all
dos-protection except <*id*>
dos-protection max-icmpv4-payload <*bytes*>
dos-protection max-icmpv6-payload <*bytes*>
dos-protection min-tcp-header <*bytes*>

Syntax Description

all	Enables protection from all DoS attacks available in the feature.
except <*ids*>	Enables protection from all available DoS attacks except those with the listed threat *ids*.
max-icmpv4-payload <*bytes*>	Sets the maximum ICMP payload size in bytes for IPv4 packets. Range is **0** to **16** KB. Default is **512** bytes.
max-icmpv6-payload <*bytes*>	Sets the maximum ICMP payload size in bytes for IPv6 packets. Range is **0** to **16** KB. Default is **512** bytes.
min-tcp-header <*bytes*>	Sets the minimum TCP header size in bytes. Range is **0** to **255** bytes. Default is **20** bytes.

Default Values

By default, DoS protection in AOS is disabled.

Command History

Release 17.7	Command was introduced.

Functional Notes

The **show dos-id** command is used to obtain the DoS threat IDs necessary to create exceptions using the **dos-protection except** <*id*> version of this command.

Usage Examples

The following example configures the DoS protection feature to protect against all available threats except threat ID **40**:

(config)**#dos-protection except 40**

dot11ap access-point-control

Use the **dot11ap access-point-control** command to globally enable the access point controller logic on the platform. Use the **no** form of this command to disable the access controller (AC) logic on the platform.

Syntax Description

No subcommands.

Default Values

By default, the AC logic is disabled.

Command History

Release 15.1	Command was introduced.

Usage Examples

The following example enables the AC logic:

(config)**#dot11ap access-point-control**

dynamic-counter <*slot/index*>

Use the **dynamic-counter** command to create a dynamic counter and enter the Dynamic Counter Configuration mode. Use the **no** form of this command to remove the dynamic counter.

Syntax Description

<*slot/index*>	Specifies the slot and port of the dynamic counter in the format <*slot/index*>. For example, **0/1**.

Default Values

By default, no dynamic counters exist.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example creates dynamic counter **0/1** and enters the Dynamic Counter Configuration mode:

```
(config)#dynamic-counter 0/1
(config-dyn-count 0/1)#
```

enable password *<password>*

Use the **enable password** command to define a password (with optional encryption and privilege level) for accessing the Enable mode. Use the **no enable password** command to remove a configured password. Variations of this command include:

enable password level *<level> <password>*
enable password md5 *<password>*
enable password md5 level *<level> <password>*
enable password *<password>*

To prevent unauthorized users from accessing the configuration functions of your device, immediately define an Enable-level password.

Syntax Description

level *<level>*	Optional. Specifies the privilege level for this enable password. Valid range is **1** through **7**.
md5	Optional. Specifies message digest 5 (MD5) as the encryption protocol to use when displaying the Enable password during show commands. If the **md5** keyword is not used, encryption is not used when displaying the Enable password during show commands.
<password>	Specifies the Enable password using a string (up to 30 characters in length).

Default Values

By default, there is no password configured for the Enable mode. By default, when an enable password is configured without specifying a privilege level, the privilege level assigned is 7.

Command History

Release 1.1	Command was introduced.
Release R10.11.0	Command was expanded to include the **level** parameter.

Usage Examples

The following example configures the enable password as **Adtran** with **md5** encryption, and specifies privilege level **4**:

(config)**#enable password md5 level 4 Adtran**
!

To provide extra security, AOS can encrypt the Enable password when displaying the current configuration. For example, the following is a **show configuration** printout (password portion) with an unencrypted Enable password (Adtran):

```
!
enable password Adtran
!
```

Alternately, the following is a **show configuration** printout (password portion) with an Enable password of Adtran using MD5 encryption:

```
!
enable password md5 encrypted 5aa5fbae7d01a90e79fb57705ce74676
!
```

ethernet ce-vlan-tpid *<value>*

Use the **ethernet ce-vlan-tpid** command to specify that tag protocol identifiers (TPIDs) other than 0x8100 are accepted on the user network interface (UNI) that is matching on customer edge (CE) virtual local area network (VLAN) ID or priority. Use the **no** form of this command to return to the default setting.

Syntax Description

<value>	Specifies the hexadecimal value of the EtherType to accept, for example, **0x88a8**.

Default Values

By default, no special global handling of TPIDs is configured, and Ethernet virtual connection (EVC) maps accept and process packets with a CE VLAN TIPID of 0x8100.

Command History

Release R11.6.0	Command was introduced.

Functional Note

All EVC maps default to the globally-specified EtherType for CE VLAN ID matching. In addition, all EVC maps default to using the specified EtherType for adding CE VLAN IDs to traffic flowing in the Metro Ethernet Network (MEN) to UNI direction when the CE VLAN ID is not preserved as well as using the specified EtherType for adding c-tags to traffic flowing in the UNI to MEN direction. For more information, refer to the *Carrier Ethernet Services in AOS* configuration guide available online at https://supportcommunity.adtran.com.

You can override the global setting to return to the default value of 0x8100 on a per-map basis using the **no ce-vlan-tpid** command from the EVC map's configuration mode.

Usage Examples

The following example globally configures the accepted CE VLAN EtherType as **0x88a8**:

(config)**#ethernet ce-vlan-tpid 0x88a8**

ethernet cfm

Use the **ethernet cfm** command to enable Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) on the AOS device. Use the **no** form of this command to disable Ethernet OAM CFM.

Syntax Description

No subcommands.

Default Values

By default, Ethernet OAM CFM is disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information regarding Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

For more information regarding specific Ethernet OAM CFM configuration commands, refer to the *Ethernet OAM CFM Command Set on page 4405*.

Usage Examples

The following example enables Ethernet OAM CFM on an AOS device:

(config)**#ethernet cfm**

ethernet cfm domain

Use the **ethernet cfm domain** command to enable and create an Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) maintenance domain (MD). Use the **no** form of this command to remove the MD. Variations of this command include:

ethernet cfm domain <*name*> **level** <*level*>
ethernet cfm domain none level <*level*>

Syntax Description

domain <*name*>	Specifies the MD's name. The name can be up to 42 characters in length.
level <*level*>	Specifies the MD's maintenance level. Range is **0** to **7**.
none	Specifies that the MD's name is not used to create the maintenance association ID (MAID).

Default Values

By default, no MDs exist.

Command History

Release 17.4	Command was introduced.

Functional Notes

This command not only creates and enables the MD, it also enters the MD Configuration mode. From the MD Configuration mode, maintenance associations (MAs) and maintenance endpoints (MEPs) can be configured. For more information on configuring MAs and MEPs, refer to the *Ethernet OAM CFM Command Set on page 4405*. When the **no** form of this command is used, the MD is deleted, as well as any MAs and MEPs defined with the domain.

The domain name serves two purposes. One is to provide a text label used in the device configuration to identify a particular domain, the other is to construct an MAID. The MAID is included in CFM continuity check messages (CCMs), and identifies the MA to which the transmitting MEP belongs. The MAID also allows MEPs receiving CCMs to detect CFM error conditions.

Because each MEP supported on an AOS device port or interface must be at a different MD level, each MEP on a particular port or interface will have to be configured on a separate MD.

For more information about Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates, enables, and enters the configuration mode of a MD named **Domain1**, created on level **6**:

(config)**#ethernet cfm domain Domain1 level 6**
(config-ecfm-domain)#

ethernet cfm log-changes

Use the **ethernet cfm log-changes** command to enable Ethernet operations, administration, and maintenance (OAM) connectivity fault management (CFM) warning messages on the AOS device. Warning messages are generated when remote maintenance endpoint (MEP) defects are detected. The **no** form of this command causes the warning messages to appear as debug messages.

Syntax Description

No subcommands.

Default Values

By default, warning messages are disabled.

Command History

Release 17.4	Command was introduced.

Functional Notes

For more information about Ethernet OAM CFM and its operation on AOS products, refer to the *Ethernet OAM CFM in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enables Ethernet OAM CFM warning messages:

(config)**#ethernet cfm log-changes**

ethernet flow-control-accept

Use the **ethernet flow-control-accept** command to include 802.3 media access control (MAC) control frames in the L2 discard counters when an Ethernet Virtual Circuit (EVC) map is configured to match L2CP traffic and discard all matched traffic. Depending on the EVC map configuration, the 802.3 MAC control frames are either counted by the L2 Discard Action counter or the L2 Discard counter when this feature is enabled (refer to the *Functional Notes* below). Use the **no** form of this command to disable this feature.

Syntax Description

No subcommands.

Default Values

By default, this feature is disabled.

Command History

Release R13.9.0	Command was introduced.

Functional Notes

In typical carrier Ethernet configurations, all Layer 2 incoming frames on the user network interface (UNI) port of a carrier Ethernet device are matched against the criteria specified in the evc-map configured on the UNI port. Frames that match the specified criteria are typically forwarded through on the associated EVC.

However, EVC maps can be configured to discard any frames matching the evc-map criteria. When the EVC map is configured to match L2CP traffic (using the command *match on page 3711*), as well as discard any matching traffic (using the command *connect discard on page 3710*), then all L2CP traffic is discarded. (Refer to the *Carrier Ethernet EVC Map Command Set on page 3705* for more information about the **connect discard** and **match** commands used in EVC map configuration).

Using the **ethernet flow-control-accept** command, in addition to an EVC map configured to discard L2CP traffic, allows 802.3 MAC control frames to be counted as part of the discarded traffic in the L2 Discard Action counter.

Using the **ethernet flow-control-accept** command in addition to EVC maps that are not configured to match L2CP traffic, specifies that the 802.3 MAC control frames are counted as part of the discarded traffic in the L2 Discard counter.

Usage Examples

The following example configure an EVC map, named **L2CP_Discard**, to discard all L2CP traffic, and then uses the **ethernet flow-control-accept** command to specify that 802.3 MAC control frames will also be counted in the L2 Discard Action counter:

(config)**#evc-map L2CP_Discard**
(config-evc-map L2CP_Discard)**#match l2cp**
(config-evc-map L2CP_Discard)**#connect uni gigabit-ethernet 0/3**
(config-evc-map L2CP_Discard)**#connect discard**
(config-evc-map L2CP_Discard)**#no ce-vlan-tpid**
(config-evc-map L2CP_Discard)**#no shutdown**
(config-evc-map L2CP_Discard)**#exit**
(config)**#ethernet flow-control-accept**

The following example configures an EVC map, named **L2CP_NoMatch**, that does not have L2CP traffic specified as matching criteria, and then uses the **ethernet flow-control-accept** command to specify that 802.3 MAC control frames are counted in the L2 Discard counter:

(config)**#evc-map L2CP_NoMatch**
(config-evc-map L2CP_NoMatch)**#connect uni gigabit-ethernet 0/3**
(config-evc-map L2CP_NoMatch)**#connect discard**
(config-evc-map L2CP_NoMatch)**#no ce-vlan-tpid**
(config-evc-map L2CP_NoMatch)**#no shutdown**
(config-evc-map L2CP_NoMatch)**#exit**
(config)**#ethernet flow-control-accept**

ethernet lmi

Use the **ethernet lmi** command to configure the Ethernet local management interface (E-LMI) polling parameters. Use the **no** form of this command to return the E-LMI polling parameters to the default value. Variations of this command include:

ethernet lmi n393 <*value*>
ethernet lmi t392 <*value*>
ethernet lmi t392 0

Syntax Description

n393 <*value*>	Configures the E-LMI operational polling status counter. Valid range is **2** to **10**.
t392 <*value*>	Configures the E-LMI polling timer in seconds. Valid range is **5** to **30** seconds.
t392 0	Disables the E-LMI polling timer.

Default Values

By default, the E-LMI polling status counter is set to **4**, and the polling timer is set to **15** seconds.

Command History

Release R11.5.0	Command was introduced.

Usage Examples

The following example configures the E-LMI polling status counter:

(config)**#ethernet lmi n393 8**

The following example disables the E-LMI polling timer:

(config)**#ethernet lmi t392 0**

ethernet loopback facility *<name> <slot>*

Use the **ethernet loopback facility** command to create a facility loopback object and enter the Facility MAC Swap Loopback Configuration mode. Use the **no** form of this command to delete the facility loopback object.

Syntax Description

<name>	Specifies the name of the facility loopback object.
<slot>	Specifies the slot identifier of the facility loopback object.

Default Values

No default values are necessary for this command.

Command History

Release R11.1.0	Command was introduced.

Functional Notes

In a facility media access control (MAC) swap loopback test, traffic is looped back upon ingressing the AOS unit. A flow ingressing the Metro Ethernet network (MEN) port interface is turned back toward that interface immediately upon entering the switch fabric. This loopback incorporates only the conditioning associated with the device's MEN port (shaping). Facility loopbacks are commonly used to validate round-trip data flow between a test head and a remote device's interface to the Ethernet backhaul. For more information regarding facility loopback objects and facility MAC swap loopback, refer to *Facility MAC Swap Loopback Command Set on page 3742*.

Usage Examples

The following example creates a facility loopback object named **FACILITY** and enters the Facility MAC Swap Loopback Configuration mode:

```
(config)#ethernet loopback facility FACILITY 0
Facility loopback "FACILITY" created
(config-eth-lbk-fac FACILITY 0)#
```

ethernet loopback system mac address

Use the **ethernet loopback system mac address** command to create a system loopback media access control (MAC) address that can be used for all MAC swap loopback tests. Use the **no** form of this command to delete the system loopback MAC address. Variations of this command include:

ethernet loopback system mac address *<mac address>*
ethernet loopback system mac address none

Syntax Description

<mac address>	Specifies a valid 48-bit MAC address. MAC addresses should be expressed in the following format: xx:xx:xx:xx:xx:xx (for example, **00:A0:C8:00:00:01**).
none	Specifies that the system loopback MAC address is not assigned.

Default Values

By default, no system loopback MAC address is defined.

Command History

Release R11.1.0	Command was introduced.

Functional Notes

In a loopback test, a signal is transmitted to a remote device, where it is returned (looped back) to the transmitting device. The transmitted and received signals can then be compared to prove circuit connectivity, isolate faults, and analyze characteristics of the data flow. Ethernet MAC swap loopback tests are analogous to traditional loopback tests employed in time division multiplexing (TDM) networks. However, in MAC swap loopbacks, the source MAC address and destination MAC addresses in the frame are swapped when the data is returned so that the incoming source and destination addresses become the outgoing destination and source addresses, respectively. This address swap is necessary because Ethernet address rules do not allow frames containing the same source MAC address to arrive from different ports on a device. For more information regarding facility loopback objects and facility MAC swap loopback, refer to *Facility MAC Swap Loopback Command Set on page 3742*.

Usage Examples

The following example configures the system loopback MAC address **00:A0:C8:00:00:01**::

(config)**#ethernet loopback system mac address 00:A0:C8:00:00:01**

ethernet loopback terminal *<name> <slot>*

Use the **ethernet loopback terminal** command to create a terminal loopback object and enter the Carrier Ethernet Terminal Loopback Configuration mode. Use the **no** form of this command to delete the terminal loopback object.

Syntax Description

<name>	Specifies the name of the terminal loopback object.
<slot>	Specifies the slot identifier of the terminal loopback object.

Default Values

No default values are necessary for this command.

Command History

Release R13.7.0	Command was introduced.

Functional Notes

In a Carrier Ethernet terminal loopback test, traffic is sent up-stream to a remote AOS device and then looped back just prior to egressing the remote AOS unit. A flow approaching the remote device's user network interface (UNI) port interface is turned back toward the switch fabric as close as possible to the UNI interface and returns traffic to the originating AOS device that is subject the same conditioning associated with the remote device's configured egress queue management and classification rules for down-stream traffic (such as Quality of Service (QoS) policers, shapers, matching criteria, and queues). Terminal loopbacks are commonly used to validate how a remote devices perform QoS on down-stream traffic by providing insight into rate limiting functionality on configured policers, traffic prioritization in egress queues, and traffic shaping as it is looped back towards the originating device.

For more information regarding terminal loopback objects and carrier Ethernet terminal loopback tests, refer to *Carrier Ethernet Terminal Loopback Command Set on page 3739*.

Usage Examples

The following example creates a terminal loopback object named **TERMINAL** and enters the Carrier Ethernet Terminal Loopback Configuration mode:

```
(config)#ethernet loopback terminal TERMINAL 0
Terminal loopback "TERMINAL" created
(config-eth-lbk-term TERMINAL 0)#
```

ethernet nni

Use the **ethernet nni** command to enable strict priority traffic management on the specified network-to-network interface (NNI). When enabled, all traffic, no matter the class, that is destined to the NNI is given a higher priority than traffic on all other user network interfaces (UNIs). Use the **no** form of this command disable strict priority traffic management on the specified NNI. Variations of this command include:

ethernet nni efm-group <*slot/group*>
ethernet nni gigabit-ethernet <*slot/port*>

Syntax Description

efm-group <*slot/group*>	Specifies an Ethernet in the first mile (EFM) group interface as the NNI on which strict priority traffic management is enabled. Valid group range is **1** to **1024**.
gigabit-ethernet <*slot/port*>	Specifies a Gigabit Ethernet interface as the NNI on which strict priority traffic management is enabled.

Default Values

By default, the NNI is not specified and strict priority traffic management is disabled.

Command History

Release R13.6.0	Command was introduced.

Usage Examples

The following example configures the EFM group **1/1** as the NNI with the highest priority traffic:

(config)**#ethernet nni efm-group 1/1**

ethernet s-tag-tpid <*data*>

Use the **ethernet s-tag-tpid** command to specify the Tag Protocol Identifier (TPID) used on all applied s-tags. Use the **no** form of this command to return to the default setting.

Syntax Description

<*data*>	Specifies a hex pattern to define the TPID. Valid range is **0x0800** to **0xFFFF**.

Default Values

By default, the TPID value is **8100**.

Command History

Release R10.11.0	Command was introduced.

Usage Examples

The following example specifies the TPID for s-tags as **88a8**:

(config)**#ethernet s-tag-tpid 88a8**

ethernet y1731 enable

Use the **ethernet y1731 enable** command to enable the Y.1731 subsystem. Use the **no** form of this command to disable the Y.1731 subsystem. Variations of this command include:

ethernet y1731 enable
ethernet y1731 enable down-mep md-level-check-filter

Syntax Description

down-mep md-level-check-filter	Optional. Enables Y.1731 frames received on a UNI port to be discarded if the MD level of the Y.1731 frame is less than or equal to the MEG level of the down MEP configured on the device.

Default Values

By default, the Y.1731 sub-system is disabled.

Command History

Release R10.10.0	Command was introduced.
Release R13.6.0	Command was expanded to include the **down-mep md-level-check-filter** parameter.

Usage Examples

The following example enables the Y.1731 subsystem:

(config)**#ethernet y1731 enable**

ethernet y1731 file-save consumption-limit

Use the **ethernet y1731 file-save consumption-limit** command to specify the maximum amount of memory that can be used to store Y.1731 performance monitoring log files. The limit specified must be larger than the space consumed by one performance monitoring file in order to allow the file to be written to memory. Use the **no** form of this command to return to the default value. Variations of this command include:

ethernet y1731 file-save consumption-limit frame-delay two-way <*memory*>
ethernet y1731 file-save consumption-limit frame-loss single-ended <*memory*>
ethernet y1731 file-save consumption-limit frame-loss synthetic single-ended <*memory*>

Syntax Description

frame-delay two-way <*memory*>	Specifies the maximum amount of memory in bytes used by two-way frame delay (ETH-DM) performance monitoring logs. Valid range is **1000** to **4294967295**.
frame-loss single-ended <*memory*>	Specifies the maximum amount of memory in bytes used by single-ended frame loss (ETH-LM) performance monitoring logs. Valid range is **1000** to **4294967295**.
frame-loss synthetic single-ended <*memory*>	Specifies the maximum amount of memory in bytes used by single-ended synthetic frame loss (ETH-SLM) performance monitoring logs. Valid range is **1000** to **4294967295**.

Default Values

By default, the maximum memory used by each performance monitoring log file type is **1000000** bytes.

Command History

Release 11.6.0	Command was introduced.

Functional Notes

By default, each time a new measurement interval occurs during a Y.1731 performance monitoring session, ETH-DM, ETH-LM, and ETH-SLM, the data from the previous interval is overwritten. The performance monitoring file save feature allows performance monitoring logs to be stored in memory in a series of hour-long log files. The unit records session data to the current log file at user-specified intervals. At the end of the user-specified log lifetime, the logs are rotated out in a first-in first-out fashion; the oldest files are deleted to make room for the new files. Each performance monitoring session type is stored in a separate file in the user-specified directory. The file is automatically named by the unit using the following format:

<*device serial*>**_<DM | LM | SLM>.Data_**<*date and time*>**.pm.xz[.current]**

Parameter	Description
<device serial>	Specifies the serial number of the unit.
DM	Specifies that the file is a single-ended (two-way) frame delay log.
LM	Specifies that the file is a single-ended frame loss log.
SLM	Specifies that the file is a single-ended synthetic frame loss log.
<date and time>	Specifes the date and time at which the log ends in the format **YYYY-MM-DD_hh.mm.ss**, for example: **2014-12-30_14:00:00**. This specifies the last time interval that the file will be written.
.pm.xz	Specifies the file extension of the log file.
.current	Appended to files that are still in use and could have data written to them.

The following example is a sample ETH-SLM file name that is no longer writable:

LBADTN340767_SLM.Data_2014-12-04_15.00.00.pm.xz

The following example is a sample ETH-LM file name of a file to which the unit is currently writing:

LBADTN340767_LM.Data_2014-12-04_15.00.00.pm.xz.current

If the file directory for the log files is changed, the files in the previous save directory will not be deleted for log rotation. Log rotation only occurs for files in the currently-specified save directory.

If any of the following conditions occur during a measurement interval, the measurement will be considered suspect, and it will be marked with a suspect flag:

- There is loss of continuity (LOC) during a measurement interval. If the LOC alarm is raised in the maintenance entity group end point (MEP) by continuity check messages (CCMs) during a measurement interval, the suspect flag will be raised for that measurement interval.
- The clock is adjusted by more than 10 seconds. If the system clock is adjusted by more than 10 seconds during a measurement interval, the suspect flag will be raised.
- The performance monitoring session is started during a measurement interval. If the session starts during a measurement interval (for example, a performance monitoring session is initiated at 3:00 with a measurement interval of 5 minutes, and the start time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The performance session is stopped during a measurement interval. If the session stops during a measurement interval (for example, a performance monitoring session was initiated at 3:00 with a measurement interval of 5 minutes, and the stop time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The Ethernet virtual circuit (EVC) status transitions to **Not Running** during a measurement interval. If the EVC over which the performance monitoring session is conducted transitions to a **Not Running** state during a measurement interval, the suspect flag will be raised for that measurement interval.
- The MEP transitions to an **Unavailable** or **Out of Service** state during a measurement interval. If the MEP goes to an **Unavailable** or **Out of Service** state during a measurement interval, the suspect flag will be raised for that measurement interval.

Usage Examples

The following example specifies that ETH-LM performance monitoring logs should use a maximum of **2000000** bytes:

(config)**#ethernet y1731 file-save consumption-limit frame-loss single-ended 2000000**

ethernet y1731 file-save directory flash <directory>

Use the **ethernet y1731 file-save directory flash** <*directory*> command to specify the directory used to store Y.1731 performance monitoring log files. Use the **no** form of this command to save performance monitoring log files in the default directory.

Syntax Description

<*directory*>	Specifies the name of the directory in which to store Y.1731 performance monitoring logs.

Default Values

By default, the Y.1731 performance monitoring log files are saved in the **y1731_pm_files** directory in **flash**.

Command History

Release 11.6.0	Command was introduced.

Functional Notes

By default, each time a new measurement interval occurs during a Y.1731 performance monitoring session, ETH-DM, ETH-LM, and ETH-SLM, the data from the previous interval is overwritten. The performance monitoring file save feature allows performance monitoring logs to be stored in memory in a series of hour-long log files. The unit records session data to the current log file at user-specified intervals. At the end of the user-specified log lifetime, the logs are rotated out in a first-in first-out fashion; the oldest files are deleted to make room for the new files. Each performance monitoring session type is stored in a separate file in the user-specified directory. The file is automatically named by the unit using the following format:

<*device serial*>**_<DM | LM | SLM>.Data_**<*date and time*>**.pm.xz[.current]**

Parameter	Description
<*device serial*>	Specifies the serial number of the unit.
DM	Specifies that the file is a single-ended (two-way) frame delay log.
LM	Specifies that the file is a single-ended frame loss log.
SLM	Specifies that the file is a single-ended synthetic frame loss log.
<*date and time*>	Specifes the date and time at which the log ends in the format **YYYY-MM-DD_hh.mm.ss**, for example: **2014-12-30_14:00:00**. This specifies the last time interval that the file will be written.
.pm.xz	Specifies the file extension of the log file.
.current	Appended to files that are still in use and could have data written to them.

The following example is a sample ETH-SLM file name that is no longer writable:

LBADTN340767_SLM.Data_2014-12-04_15.00.00.pm.xz

The following example is a sample ETH-LM file name of a file to which the unit is currently writing:

LBADTN340767_LM.Data_2014-12-04_15.00.00.pm.xz.current

If the file directory for the log files is changed, the files in the previous save directory will not be deleted for log rotation. Log rotation only occurs for files in the currently-specified save directory.

If any of the following conditions occur during a measurement interval, the measurement will be considered suspect, and it will be marked with a suspect flag:

- There is loss of continuity (LOC) during a measurement interval. If the LOC alarm is raised in the maintenance entity group end point (MEP) by continuity check messages (CCMs) during a measurement interval, the suspect flag will be raised for that measurement interval.
- The clock is adjusted by more than 10 seconds. If the system clock is adjusted by more than 10 seconds during a measurement interval, the suspect flag will be raised.
- The performance monitoring session is started during a measurement interval. If the session starts during a measurement interval (for example, a performance monitoring session is initiated at 3:00 with a measurement interval of 5 minutes, and the start time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The performance session is stopped during a measurement interval. If the session stops during a measurement interval (for example, a performance monitoring session was initiated at 3:00 with a measurement interval of 5 minutes, and the stop time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The Ethernet virtual circuit (EVC) status transitions to **Not Running** during a measurement interval. If the EVC over which the performance monitoring session is conducted transitions to a **Not Running** state during a measurement interval, the suspect flag will be raised for that measurement interval.
- The MEP transitions to an **Unavailable** or **Out of Service** state during a measurement interval. If the MEP goes to an **Unavailable** or **Out of Service** state during a measurement interval, the suspect flag will be raised for that measurement interval.

Usage Examples

The following example specifies that Y.1731 performance monitoring logs should be saved in the **y1731_logs** directory in **flash**:

(config)**#ethernet y1731 file-save directory flash y1731_logs**

ethernet y1731 file-save interval *<interval>*

Use the **ethernet y1731 file-save directory interval** *<interval>* command to specify the frequency with which Y.1731 performance monitoring data will be written to the log files. Use the **no** form of this command to return to the default value.

Syntax Description

<interval>	Specifies the frequency (in seconds) with which Y.1731 performance monitoring data is written to to the log files. Valid range is **300** to **3600** seconds.

Default Values

By default, data is written to the Y.1731 performance monitoring log files every **900** seconds (15 minutes).

Command History

Release 11.6.0	Command was introduced.

Functional Notes

By default, each time a new measurement interval occurs during a Y.1731 performance monitoring session, ETH-DM, ETH-LM, and ETH-SLM, the data from the previous interval is overwritten. The performance monitoring file save feature allows performance monitoring logs to be stored in memory in a series of hour-long log files. The unit records session data to the current log file at user-specified intervals. At the end of the user-specified log lifetime, the logs are rotated out in a first-in first-out fashion; the oldest files are deleted to make room for the new files. Each performance monitoring session type is stored in a separate file in the user-specified directory. The file is automatically named by the unit using the following format:

*<device serial>***_<DM | LM | SLM>.Data_***<date and time>***.pm.xz[.current]**

Parameter	Description
<device serial>	Specifies the serial number of the unit.
DM	Specifies that the file is a single-ended (two-way) frame delay log.
LM	Specifies that the file is a single-ended frame loss log.
SLM	Specifies that the file is a single-ended synthetic frame loss log.
<date and time>	Specifes the date and time at which the log ends in the format **YYYY-MM-DD_hh.mm.ss**, for example: **2014-12-30_14:00:00**. This specifies the last time interval that the file will be written.
.pm.xz	Specifies the file extension of the log file.
.current	Appended to files that are still in use and could have data written to them.

The following example is a sample ETH-SLM file name that is no longer writable:

LBADTN340767_SLM.Data_2014-12-04_15.00.00.pm.xz

The following example is a sample ETH-LM file name of a file to which the unit is currently writing:

LBADTN340767_LM.Data_2014-12-04_15.00.00.pm.xz.current

If the file directory for the log files is changed, the files in the previous save directory will not be deleted for log rotation. Log rotation only occurs for files in the currently-specified save directory.

If any of the following conditions occur during a measurement interval, the measurement will be considered suspect, and it will be marked with a suspect flag:

- There is loss of continuity (LOC) during a measurement interval. If the LOC alarm is raised in the maintenance entity group end point (MEP) by continuity check messages (CCMs) during a measurement interval, the suspect flag will be raised for that measurement interval.
- The clock is adjusted by more than 10 seconds. If the system clock is adjusted by more than 10 seconds during a measurement interval, the suspect flag will be raised.
- The performance monitoring session is started during a measurement interval. If the session starts during a measurement interval (for example, a performance monitoring session is initiated at 3:00 with a measurement interval of 5 minutes, and the start time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The performance session is stopped during a measurement interval. If the session stops during a measurement interval (for example, a performance monitoring session was initiated at 3:00 with a measurement interval of 5 minutes, and the stop time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The Ethernet virtual circuit (EVC) status transitions to **Not Running** during a measurement interval. If the EVC over which the performance monitoring session is conducted transitions to a **Not Running** state during a measurement interval, the suspect flag will be raised for that measurement interval.
- The MEP transitions to an **Unavailable** or **Out of Service** state during a measurement interval. If the MEP goes to an **Unavailable** or **Out of Service** state during a measurement interval, the suspect flag will be raised for that measurement interval.

Usage Examples

The following example specifies that data is written to the Y.1731 performance monitoring logs every **300** seconds (5 minutes):

(config)**#ethernet y1731 file-save interval 300**

ethernet y1731 file-save lifetime

Use the **ethernet y1731 file-save lifetime** command to specify the amount of time a performance monitoring log file will remain in memory before the is rotated out. The oldest file is deleted from memory when a new log file must be written. Use the **no** form to return to the default value. Variations of this command include:

ethernet y1731 file-save lifetime <*lifetime*>
ethernet y1731 file-save lifetime unlimited

Syntax Description

<*lifetime*>	Specifies the number of seconds that log files will be kept (as long as the consumption limit is not exceeded). Valid range is **3600** to **4294967295**.
unlimited	Specifies that logs will be kept indefinitely.

Default Values

By default, the Y.1731 performance monitoring log files have a lifetime of **86400** seconds.

Command History

Release 11.6.0	Command was introduced.

Functional Notes

By default, each time a new measurement interval occurs during a Y.1731 performance monitoring session, ETH-DM, ETH-LM, and ETH-SLM, the data from the previous interval is overwritten. The performance monitoring file save feature allows performance monitoring logs to be stored in memory in a series of hour-long log files. The unit records session data to the current log file at user-specified intervals. At the end of the user-specified log lifetime, the logs are rotated out in a first-in first-out fashion; the oldest files are deleted to make room for the new files. Each performance monitoring session type is stored in a separate file in the user-specified directory. The file is automatically named by the unit using the following format:

<*device serial*>**_<DM | LM | SLM>.Data_**<*date and time*>**.pm.xz[.current]**

Parameter	Description
<*device serial*>	Specifies the serial number of the unit.
DM	Specifies that the file is a single-ended (two-way) frame delay log.
LM	Specifies that the file is a single-ended frame loss log.
SLM	Specifies that the file is a single-ended synthetic frame loss log.
<*date and time*>	Specifes the date and time at which the log ends in the format **YYYY-MM-DD_hh.mm.ss**, for example: **2014-12-30_14:00:00**. This specifies the last time interval that the file will be written.
.pm.xz	Specifies the file extension of the log file.
.current	Appended to files that are still in use and could have data written to them.

The following example is a sample ETH-SLM file name that is no longer writable:

LBADTN340767_SLM.Data_2014-12-04_15.00.00.pm.xz

The following example is a sample ETH-LM file name of a file to which the unit is currently writing:

LBADTN340767_LM.Data_2014-12-04_15.00.00.pm.xz.current

If the file directory for the log files is changed, the files in the previous save directory will not be deleted for log rotation. Log rotation only occurs for files in the currently-specified save directory.

If any of the following conditions occur during a measurement interval, the measurement will be considered suspect, and it will be marked with a suspect flag:

- There is loss of continuity (LOC) during a measurement interval. If the LOC alarm is raised in the maintenance entity group end point (MEP) by continuity check messages (CCMs) during a measurement interval, the suspect flag will be raised for that measurement interval.
- The clock is adjusted by more than 10 seconds. If the system clock is adjusted by more than 10 seconds during a measurement interval, the suspect flag will be raised.
- The performance monitoring session is started during a measurement interval. If the session starts during a measurement interval (for example, a performance monitoring session is initiated at 3:00 with a measurement interval of 5 minutes, and the start time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The performance session is stopped during a measurement interval. If the session stops during a measurement interval (for example, a performance monitoring session was initiated at 3:00 with a measurement interval of 5 minutes, and the stop time is set to 3 minutes after 3:00) then the suspect flag will be raised for that measurement interval.
- The Ethernet virtual circuit (EVC) status transitions to **Not Running** during a measurement interval. If the EVC over which the performance monitoring session is conducted transitions to a **Not Running** state during a measurement interval, the suspect flag will be raised for that measurement interval.
- The MEP transitions to an **Unavailable** or **Out of Service** state during a measurement interval. If the MEP goes to an **Unavailable** or **Out of Service** state during a measurement interval, the suspect flag will be raised for that measurement interval.

Usage Examples

The following example specifies that Y.1731 performance monitoring logs should have a lifetime of **604800** (one week):

(config)**#ethernet y1731 file-save lifetime 604800**

ethernet y1731 linktrace-cache

Use the **ethernet y1731 linktrace-cache** command to configure the Y.1731 subsystem's linktrace cache settings. Use the **no** form of this command to return to the default setting. Variations of this command include:

ethernet y1731 linktrace-cache hold-time <*minutes*>
ethernet y1731 linktrace-cache size <*value*>

Syntax Description

hold-time <*minutes*>	Configures how long linktrace replies are maintained in the linktrace cache. Valid range is **1** to **100** minutes.
size <*value*>	Configures the maximum number of entires maintained in the linktrace cache. Valid range is **10** to **500** entries.

Default Values

By default, linktrace replies are maintained in the linktrace cache for **33** minutes, and a maximum of **100** entries is maintained in the linktrace cache.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

The following example configures the unit to maintain linktrace replies in the cache for **100** minutes :

(config)#**ethernet y1731 linktrace-cache hold-time 100**

ethernet y1731 meg

Use the **ethernet y1731 meg** command to create a Y.1731 maintenance entity group (MEG) and access the Y.1731 MEG Configuration mode. Use the **no** form of this command to remove the specified MEG. Variations of this command include:

ethernet y1731 meg char-string <*name*> **level** <*value*>
ethernet y1731 meg icc-umc <*name*> **level** <*value*>

Syntax Description

char-string <*name*>	Specifies a MEG name using a character string format. Maximum length is **45** ASCII characters.
icc-umc <*name*>	Specifies a MEG name using the ITU-CarrierCode Unique MEG ID Code MEG (ICC-UMC) format. Maximum length is **13** ASCII characters.
level <*value*>	Specifies the MEG level. Valid range is **0** to **7**.

Default Values

By default, no MEGs are configured.

Command History

Release R10.10.0	Command was introduced.

Usage Examples

The following example creates a MEG using the character string format with a MEG level of **1**:

(config)**#ethernet y1731 meg char-string meg1 level 1**

evc *<name>*

Use the **evc** command to create an Ethernet virtual connection (EVC) and enter the EVC configuration mode. Using the **no** form of this command removes the EVC from the AOS unit's configuration.

Syntax Description

<name>	Specifies the name for the EVC.

Default Values

By default, no EVCs are configured.

Command History

Release R10.10.0	Command was introduced.

Functional Notes

The EVC connects two endpoints (for example, an Ethernet in the first mile (EFM) group and the Gigabit Ethernet interface) and passes Ethernet service frames though the endpoints. The EVCs prevent data transfer between subscriber sites that are not part of the same EVC, thus providing data privacy and security similar to a Frame Relay or an asynchronous transfer mode (ATM) permanent virtual circuit (PVC). EVCs are configured to be part of a bonding group (EFM group).

More information about the configuration of EVCs can be found in the *MEF EVC Command Set on page 3674*.

Usage Examples

The following example creates an EVC named **DATA** and enters the EVC configuration mode:

```
(config)#evc DATA
(config-evc-DATA)#
```

evc-map <*name*>

Use the **mef evc-map** command to create a Layer2/Layer 3 Ethernet virtual connection (EVC) map and enter the EVC Map Configuration mode. The EVC map is used to match traffic to a specific EVC using matching criteria similar to that of quality of service (QoS) matching. Using the **no** form of this command removes the EVC map from the AOS unit's configuration.

Syntax Description

<*name*>	Specifies the name of the EVC map.

Default Values

By default, no EVC maps are configured.

Command History

Release R10.10.0	Command was introduced.

Functional Notes

Once an EVC map is created, it must be configured and applied to both an EVC and a user network interface (UNI). For more information about the configuration of EVC maps, refer to *MEF EVC Map Command Set on page 3678*.

Usage Examples

The following example creates the EVC map **Map1** and enters the EVC Map Configuration mode:

```
(config)#evc-map Map1
(config-evc-map-Map1)#
```

event-history on

Use the **event-history on** command to enable event logging for the AOS system. Event log messages will not be recorded unless this command has been issued (regardless of the **event-history priority** configured). The event log may be displayed using the **show event-history** command. Use the **no** form of this command to disable the event log.

Syntax Description

No subcommands.

Default Values

By default, the AOS event logging capabilities are disabled.

Command History

Release 1.1	Command was introduced.

Functional Notes

The event history provides useful information regarding the status of the system and individual port states. Use the event history as a troubleshooting tool when identifying system issues. The following is a sample event history log.

#show event-history
Using 526 bytes
2002.07.12 15:34:01 T1.t1 1/1 Yellow
2002.07.12 15:34:01 INTERFACE_STATUS.t1 1/1 changed state to down.
2002.07.12 15:34:02 T1.t1 1/1 No Alarms
2002.07.12 15:34:02 INTERFACE_STATUS.t1 1/1 changed state to up.
2002.07.12 15:34:03 INTERFACE_STATUS.eth 0/1 changed state to up.
2002.07.12 15:34:10 OPERATING_SYSTEM Warm Start
2002.07.12 15:34:12 PPP.NEGOTIATION LCP up
2002.07.12 15:34:12 PPP.NEGOTIATION IPCP up

Usage Examples

The following example enables the AOS event logging feature:

(config)**#event-history on**

event-history priority

Use the **event-history priority** command to set the threshold for events stored in the event history. All events with the specified priority or higher will be kept for viewing in the local event log. The event log may be displayed using the **show event-history** command. Use the **no** form of this command to keep specified priorities from being logged. Variations of this command include:

event-history priority debug
event-history priority error
event-history priority fatal
event-history priority info
event-history priority notice
event-history priority warning

Syntax Description

debug	Logs subsystem debugging events.
error	Logs events with **error** and **fatal** priorities.
fatal	Logs only events with a **fatal** priority.
info	Logs all events.
notice	Logs events with **notice**, **warning**, **error**, and **fatal** priorities.
warning	Logs events with **warning**, **error**, and **fatal** priorities.

Default Values

By default, no event messages are logged to the event history.

Command History

Release 1.1	Command was introduced.
Release R10.1.0	Command was expanded to include the **debug** keyword.

Functional Notes

The event history provides useful information regarding the status of the system and individual port states. Use the event history as a troubleshooting tool when identifying system issues. The following is a sample event history log.

#show event-history
Using 526 bytes
2002.07.12 15:34:01 T1.t1 1/1 Yellow
2002.07.12 15:34:01 INTERFACE_STATUS.t1 1/1 changed state to down.
2002.07.12 15:34:02 T1.t1 1/1 No Alarms
2002.07.12 15:34:02 INTERFACE_STATUS.t1 1/1 changed state to up.
2002.07.12 15:34:03 INTERFACE_STATUS.eth 0/1 changed state to up.
2002.07.12 15:34:10 OPERATING_SYSTEM Warm Start
2002.07.12 15:34:12 PPP.NEGOTIATION LCP up
2002.07.12 15:34:12 PPP.NEGOTIATION IPCP up

Usage Examples

The following example logs all events to the event history:

(config)**#event-history priority info**

event-history size *<size>*

Use the **event-history size** command to change the event log size for the AOS system. Use the **no** form of this command to return to the default setting.

Syntax Description

<size>	Specifies the log size in kilobytes. The valid range is **6** to **256**.

Default Values

By default, the event log size is 6 kilobytes.

Command History

Release R11.5.0	Command was introduced.

Functional Notes

Event log messages will not be recorded unless the **event-history on** command has been issued (regardless of the **event-history priority** configured). The event log can be displayed using the **show event-history** command.

Usage Examples

The following example sets the event history log to 256 kilobytes:

(config)**#event-history size 256**

exception memory minimum <*value*>

Use the **exception memory minimum** command to initiate a reboot when the specified minimum amount of memory is no longer available. This ensures that adequate memory is available to store an exception report. Use the **no** form of this command to disable rebooting when the minimum memory limitation is violated.

*Executing the **exception memory minimum** command may cause the unit to reboot. Adtran recommends only using this command if advised by Adtran Technical Support.*

Syntax Description

<*value*>	Specifies the minimum amount of memory (in bytes) that must be free before a reboot occurs.

Default Values

By default, **exception memory minimum** is disabled.

Command History

Release 12.1	Command was introduced.

Usage Examples

The following example sets the exception memory minimum to **3** MB:

(config)**#exception memory minimum 30000000**

exception report

Use the **exception report** command to specify the name of the output file for the exception report. Use the **no** form of this command to return to the default setting. Variations of this command include:

exception report
exception report file-name <*filename*>

Syntax Description

file-name <*filename*>	Optional. Specifies a file name for the exception report other than the default file name.

Default Values

By default, the exception report file name is **exception report-yyyyMMddHHmmss**. (The yyyyMMddHHmmss will be automatically replaced with the actual year, month, day, hour, minutes, and seconds.)

Command History

Release 10.1	Command was introduced.

Usage Examples

The following example specifies **example** as the name of the output file for an exception report:

(config)**#exception report file-name example**
(config)**#exit**
#exception report generate
Exception report generated.
#show flash
1744 startup-config
45676 example-20050708080537
#config t
(config)**#no exception report file-name**
(config)**#exit**
Appropriate commands must be issued to preserve configuration.
#exception report generate
Exception report generated.
#show flash
1744 startup-config
45676 example-20050708080537
45900 exception-report-20050708080552

ffe wildcard

Use the **ffe wildcard** command to enable RapidRoute flow bundling for all interfaces within an Internet Protocol (IP) address family. Use the **no** form of this command to disable RapidRoute flow bundling on all interfaces within an IP address family. Variations of this command include:

ip ffe wildcard
ipv6 ffe wildcard

Syntax Description

ip	Specifies that flow bundling is disabled on all interfaces within the IP version 4 (IPv4) address family.
ipv6	Specifies that flow bundling is disabled on all interfaces within the IP version 6 (IPv6) address family.

Default Values

RapidRoute flow bundling is enabled by default.

Command History

Release R11.10.1	Command was introduced.

Functional Notes

RapidRoute flow bundling is enabled and automatically activated on most AOS products. This command is typically used in the **no** form to disable flow bundling and all wildcards for all interfaces in a particular address family. This may be needed when flow bundling is interacting with another AOS feature and it needs to be disabled. Entering the command in regular form re-enables flow bundling for all interfaces in the specified address family.

Usage Examples

The following example disables RapidRoute flow bundling and wildcards for all interfaces in the IPv4 address family:

(config)**#no ip ffe wildcard**

filesystem throttle

Use the **filesystem throttle** command to enable File Transfer Protocol (FTP) throttling. Enabling this command limits the number of FTP sessions, the maximum number of large files open at one time, the size of the large files, and the number of open files that are smaller than the large file size. Use the **no** form of this command to disable FTP throttling.

Syntax Description

No subcommands.

Default Values

By default, FTP throttling is disabled.

Command History

Release R11.4.0	Command was introduced.

Functional Notes

When FTP throttling is enabled, the following limits are imposed on FTP sessions:

Maximum FTP Sessions: 24
Large File Size: 30 MB
Maximum Number of Large Files Open: 2
Number of files less than Large File Size open for FTP: FTP Session limit (24)

When FTP throttling is disabled, the following limits are imposed on FTP sessions:

Maximum FTP Sessions: 100
Large File Size: unlimited
Maximum Number of Large Files Open: unlimited
Number of files less than Large File Size open for FTP: FTP Session limit (100)

Usage Examples

The following example enables FTP throttling:

(config)**#filesystem throttle**

ftp authentication *<listname>*

Use the **ftp authentication** command to specify that an authentication, authorization, and accounting (AAA) authentication method list is used by the AOS device's internal File Transfer Protocol (FTP) server for FTP authentication. AAA must be enabled to apply the method list to FTP authentication. Use the **no** form of this command to remove the authentication method list from FTP authentication.

Syntax Description

<listname>	Specifies the AAA authentication method list to apply to FTP authentication.

Default Values

By default, no AAA authentication method list is applied to FTP. If AAA is enabled (using the command *aaa on on page 1187*), but no list is assigned to FTP, FTP automatically uses the local user list for authentication.

Command History

Release 5.1	Command was introduced.

Functional Notes

AAA must be enabled for an authentication list to be applied to FTP authentication. For more information on enabling AAA, refer to the command *aaa on on page 1187*.

AAA authentication lists for use with FTP can be lists that control user login permissions or lists that control user Enable mode access permissions. These lists are created using the following commands: *aaa authentication login on page 1169* and *aaa authentication enable default on page 1165*.

For more information on AAA configuration, refer to the configuration guide *Configuring AAA in AOS* available online at https://supportcommunity.adtran.com.

Usage Examples

The following example attaches the authentication method list **MyList** to the FTP server:

(config)**#ftp authentication MyList**

garp timer <*value*>

Use the **garp timer** command to adjust the timers used in all Generic Attribute Registration Protocol (GARP) applications (currently only GARP VLAN Registration Protocol (GVRP)) on the switch. Use the **no** form of this command to return to the default setting. Variations of this command include:

garp timer join <*value*>
garp timer leave <*value*>
garp timer leaveall <*value*>

Syntax Description

join <*value*>	Specifies the timer value (in milliseconds) between GARP application join messages.
leave <*value*>	Specifies the timer value (in milliseconds) between GARP application leave messages (must be at least three times longer than the join timer).
leaveall <*value*>	Specifies the timer value (in milliseconds) between GARP application leave all messages (must be greater than the leave timer).

Default Values

By default, the **join** timer is **200** milliseconds, the **leave** timer is **600** milliseconds, and the **leaveall** timer is **10000** milliseconds.

Command History

Release 8.1	Command was introduced.

Functional Notes

All devices communicating using GARP in the network need to have the same values for these timers. Changing these values is not recommended.

Usage Examples

The following example specifies the time (in milliseconds) between GARP application **leave all** messages:

(config)**#garp timer leaveall 20000**

global-policer warning

Use the **global-policer warning** command to enable virtual AOS (vAOS) global policer warning event generation for both rate usage and dropped packet messages. Use the **no** form of this command to disable the warning messages.

Syntax Description

No subcommands.

Default Values

By default, vAOS global policer event messages are enabled.

Command History

Release R12.1.0	Command was introduced.

Usage Examples

The following example disables vAOS global policer event messages:

(config)**#no global-policer warning**

global-policer warning threshold dropped-packets *<number>*

Use the **global-policer warning threshold dropped-packets** command to configure a threshold for generating a virtual AOS (vAOS) global policer dropped packets warning event. Use the **no** form of this command to return the dropped packet threshold to the default value.

Syntax Description

<number>	Specifies the dropped packet threshold for generating vAOS global policer warning messages. Valid range is **1** to **4294967295** packets.

Default Values

By default, a vAOS global policer warning message is generated when over **10000** packets are dropped during the five minute warning period.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

When the number of packets dropped due to exceeding the vAOS licensed bandwidth exceeds the specified threshold during the five minute warning period, a warning message will be generated. This message can be useful in determining the cause of dropped packets in the network.

Usage Examples

The following example specifies that vAOS global policer warning messages are sent when more than **675000** packets are dropped during the five minute warning period:

(config)**#global-policer warning threshold dropped-packets 675000**

global-policer warning threshold rate-percent *<percent>*

Use the **global-policer warning threshold rate-percent** command to specify that when the virtual AOS (vAOS) actual traffic rate exceeds the specified percentage of the total licensed data rate during the warning period (five minutes), a warning message is generated. Use the **no** form of this command to return the rate percent threshold to the default value.

Syntax Description

<percent>	Specifies the percent threshold for generating vAOS global policer warning messages. Valid range is **1** to **99** percent.

Default Values

By default, vAOS global policer messages are generated when **90** percent of the total licensed data rate is exceeded within a five minute period.

Command History

Release R12.1.0	Command was introduced.

Functional Notes

Traffic is not actually dropped by the vAOS global policer when this threshold is exceeded unless the licensed bandwidth is exceeded. This warning message can be useful in determining if additional vAOS bandwidth should be purchased.

Usage Examples

The following example configures the vAOS data usage rate that generates a warning message as **75** percent:

(config)**#global-policer warning threshold rate-percent 75**

gvrp

Use the **gvrp** command to enable GARP VLAN Registration Protocol (GVRP) on the switch globally. Use the **no** form of this command to disable this feature.

Syntax Description

No subcommands.

Default Values

By default, GVRP is disabled.

Command History

Release 8.1	Command was introduced.

Functional Notes

Disabling GVRP globally will disable GVRP on all interfaces.

Usage Examples

The following example enables GVRP on the switch globally:

(config)**#gvrp**

hmr intercept

Use the **hmr intercept** command to configure the Session Initiation Protocol (SIP) header manipulation rules (HMR) intercept feature, and enter the HMR Intercept Configuration mode. Use the **no** form of this command to remove the HMR intercept feature configuration.

Syntax Description

No subcommands.

Default Values

By default, no HMR intercept policies exist, and the feature is disabled.

Command History

Release R12.4.0	Command was introduced.

Functional Notes

HMR intercept is a mechanism that allows standard HMR policies to be used to alter the flow of selected SIP requests. HMR intercept policies, when created and enabled, are given first access to inbound SIP requests. These policies can be used to generate a request response, block the processing of a request, or modify a request before other SIP agents within the device gain control of the request.

The HMR intercept policy's rules are evaluated to determine whether one or more rules match a given SIP request. If a match occurs, all rules that match within the policy are applied to the traffic in the same way that inbound or outbound HMR policies are applied. In addition, HMR intercept actions assigned to the intercept policy are applied to the SIP request.

For more information about the HMR intercept policy rules and actions, refer to the *HMR Intercept Command Set on page 4812*. For more information about SIP HMR, refer to the configuration guide *Manipulating SIP Headers and Messages in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enters the HMR Intercept Policy configuration mode:

```
(config)#hmr intercept
(config-hmr-intercept)#
```

hmr policy *<name>*

Use the **hmr policy** command to create a Session Initiation Protocol (SIP) header manipulation rule (HMR) policy and enter the policy's configuration mode. The HMR policy is a named collection of one or more HMR rule sets, and the policy is used to apply the rule sets to specific SIP traffic, SIP proxy user traffic, SIP proxy server traffic, or trunks. Use the **no** version of this command to remove the HMR policy.

Syntax Descriptions

<name>	Specifies the name of the HMR policy.

Default Values

By default, no HMR policies exist.

Command History

Release R10.1.0	Command was introduced.

Functional Notes

SIP header manipulation is achieved by creating an HMR policy, a set of HMR rules, and applying those rules to the HMR policy. The policy is then applied to a SIP trunk, to all SIP traffic on the AOS device, to SIP traffic sent or received by a SIP proxy user, or to a SIP traffic sent or received by a SIP proxy server. The HMR policies can be applied to either inbound or outbound SIP traffic. For more information about configuring SIP HMR policies, refer to *HMR Command Set on page 4762* or the configuration guide *Manipulating SIP Headers and Messages in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates the SIP HMR policy **MYPOLICY1**, and enters the policy's configuration mode:

```
(config)#hmr policy MYPOLICY1
(config-policy-MYPOLICY1)#
```

hmr rule-set *<name>*

Use the **hmr rule-set** command to create a Session Initiation Protocol (SIP) header manipulation rule (HMR) rule set. An HMR rule set is a named collection of one or more sequenced message rules used for SIP header and message manipulation. When a rule set is applied to a message, all matching message rules are processed in sequence. Use the **no** form of this command to remove the HMR rule set.

Syntax Description

<name>	Specifies the name of the HMR rule set. Names must be unique for each configured rule set.

Default Values

By default, no HMR rule sets are configured.

Command History

Release R10.1.0	Command was introduced.

Functional Notes

HMR rule sets are used to apply message rules to SIP traffic. These message rules are a collection of one or more SIP header commands, that determine the types of SIP headers to act upon, and the action to be taken. For more information about the configuration of SIP HMR rules and rule sets, refer to *HMR Command Set on page 4762* or the configuration guide *Manipulating SIP Headers and Messages in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates the HMR rule set **SET1**, and enters the rule set's configuration mode:

```
(config)#hmr rule-set SET1
(config-rule-set-SET1)#
```

hmr set public-variable <*variable*> new-value <*pattern*>

Use the **hmr set public-variable** command to specify a public variable to be used with Session Initiation Protocol (SIP) header manipulation rule (HMR) configurations. Use the **no** form of this command to remove the public variable.

> NOTE *Public variables for SIP HMR can be set globally using this command, or from the HMR Message Rule Configuration Mode (refer to HMR Command Set on page 4762 for more information).*

Syntax Description

<variable>	Specifies the variable to be set.
<pattern>	Specifies the new value to be used by the variable. The pattern can be a regular expression or a text string.

Default Values

By default, no public variables are configured.

Command History

Release R10.1.0	Command was introduced.

Functional Notes

For more information about the creation and use of public variables in SIP HMR, refer to the configuration guide *Manipulating SIP Headers and Messages in AOS*, available online at https://supportcommunity.adtran.com.

Usage Examples

The following example sets the value of the public variable **paiTest**:

(config)**#hmr set public-variable paiTest new-value match**

host

Use the **host** command to define an Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) host name either for the default virtual routing and forwarding (VRF) or for a specified VRF instance. This allows you to statically enter host names and addresses in the host table. Use the **no** form of this command to remove the static entries. Variations of this command include:

host <*hostname*> <*ipv4 address*>
host <*hostname*> <*ipv6 address*>
host vrf <*name*> <*hostname*> <*ipv4 address*>
host vrf <*name*> <*hostname*> <*ipv6 address*>

Syntax Description

<*hostname*>	Defines the name of the host being added to the host table.
<*ipv4 address*>	Specifies the IPv4 address associated with the host name. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
<*ipv6 address*>	Specifies the IPv6 address associated with the host name. IPv6 addresses should be expressed in colon hexadecimal format (**X:X:X:X::X**). For example, **2001:DB8:1::1**.
vrf <*name*>	Optional. Specifies a nondefault VRF instance on which to define the IPv4 or IPv6 host name. If no VRF instance is specified, the host name is defined on the default unnamed VRF instance.

Default Values

By default, there are no static hosts configured.

Command History

Release 3.1	Command was introduced.
Release 16.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command was expanded to include the <*ipv6 address*> parameter. In addition, the command syntax was changed to remove the **ip** keyword for Adtran internetworking products.
Release R10.1.0	The command syntax was changed to remove the **ip** keyword for Adtran voice products.

Functional Notes

The host name can be any combination of numbers and letters as long as it is not a valid IPv4 or IPv6 address or does not exceed 256 characters.

VRF instances on AOS products allow a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example defines three static entries to the host table:

(config)**#host mac 10.2.0.2**
(config)**#host dal 172.38.7.12**
(config)**#host name1 2001:DB8:1::1**

hostname *<name>*

Use the **hostname** command to create a name used to identify the unit. This alphanumeric string should be used as a unique description for the unit. This string will be displayed in all prompts. Use the **no** form of this command to remove a host name.

Syntax Description

<name>	Identifies the unit using an alphanumeric string up to 32 characters.

Default Values

By default, the host name is **router**.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example creates a host name for the AOS device of **ATL_RTR** to identify the system as the Atlanta router:

(config)**#hostname ATL_RTR**

http authentication <*listname*>

Use the **http authentication** command to assign a specified authentication, authorization, and accounting (AAA) list to use in authentication to the AOS device's Hypertext Transfer Protocol (HTTP) or HTTP secure (HTTPS) server. AAA must be enabled (using the command *aaa on on page 1187*) before you can apply an AAA list to HTTP authentication. Use the **no** form of this command to remove the AAA list name from HTTP authentication.

Syntax Description

<*listname*>	Specifies the AAA list to use in authentication to the AOS device's HTTP/HTTPS server.

Default Values

By default, no HTTP/HTTPS authentication is configured.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example assigns the AAA list **Mylist1** to HTTP authentication:

(config)**#http authentication Mylist1**

http ip access-class <*ipv4 acl name*> in

se the **http ip access-class in** command to restrict access to the Internet Protocol version 4 (IPv4) Hypertext Transfer Protocol (HTTP) server using the specified IPv4 access control list (ACL). Use the **no** form of this command to remove the IPv4 ACL from the HTTP connection. Variations of this command include:

http ip access-class <*ipv4 acl name*> **in**
http ip access-class <*ipv4 acl name*> **in any-vrf**
http ip access-class <*ipv4 acl name*> **in vrf** <*name*>

Syntax Description

<*ipv4 acl name*>	Specifies the previously configured IPv4 ACL to use for IPv4 HTTP access restriction.
in	Specifies that the ACL is applied to incoming IPv4 HTTP connections.
any-vrf	Optional. Allows incoming IPv4 HTTP connections from any virtual routing and forwarding (VRF) instance.
vrf <*name*>	Optional. Allows incoming IPv4 HTTP connections from a specified VRF instance.

Default Values

By default, no IPv4 ACLs are applied to IPv4 HTTP connections.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to relocate the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to relocate the **ip** keyword for IPv6 support in Adtran voice products.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Usage Examples

The following example specifies that IPv4 HTTP access is restricted by applying the previously configured IPv4 ACL (**MyIPv4ACL**):

(config)**#http ip access-class MyIPv4ACL in**

http ip secure-access-class <*ipv4 acl name*> in

Use the **http ip secure-access-class in** command to restrict access to the Internet Protocol version 4 (IPv4) Hypertext Transfer Protocol secure (HTTPS) server using the specified IPv4 access control list (ACL). Use the **no** form of this command to remove the IPv4 ACL from the HTTPS connection. Variations of this command include:

http ip secure-access-class <*ipv4 acl name*> **in**
http ip secure-access-class <*ipv4 acl name*> **in any-vrf**
http ip secure-access-class <*ipv4 acl name*> **in vrf** <*name*>

Syntax Description

<*ipv4 acl name*>	Specifies the previously configured IPv4 ACL to use for HTTPS access restriction.
in	Specifies that the ACL is applied to incoming IPv4 HTTPS connections.
any-vrf	Optional. Allows incoming IPv4 HTTPS connections from any virtual routing and forwarding (VRF) instance.
vrf <*name*>	Optional. Allows incoming IPv4 HTTPS connections from a specified VRF instance.

Default Values

By default, no IPv4 ACLs are applied to HTTPS connections.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to relocate the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to relocate the **ip** keyword for IPv6 support in Adtran voice products.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Usage Examples

The following example specifies that HTTPS access is restricted by applying the previously configured IPv4 ACL (**MyIPv4ACL**):

(config)**#http ip secure-access-class MyIPv4ACL in**

http ipv6 access-class <*ipv6 acl name*> in

Use the **http ipv6 access-class in** command to restrict access to the Internet Protocol version 6 (IPv6) Hypertext Transfer Protocol (HTTP) server using the specified IPv6 access control list (ACL). Use the **no** form of this command to remove the IPv6 ACL from the HTTP connection. Variations of this command include:

http ipv6 access-class <*ipv6 acl name*> **in**
http ipv6 access-class <*ipv6 acl name*> **in any-vrf**
http ipv6 access-class <*ipv6 acl name*> **in vrf** <*name*>

Syntax Description

<*ipv6 acl name*>	Specifies the previously configured IPv6 ACL to use for HTTP access restriction.
in	Specifies that the ACL is applied to incoming IPv6 HTTP connections.
any-vrf	Optional. Allows incoming IPv6 HTTP connections from any virtual routing and forwarding (VRF) instance.
vrf <*name*>	Optional. Allows incoming IPv6 HTTP connections from a specified VRF instance.

Default Values

By default, no IPv6 ACLs are applied to HTTP connections.

Command History

Release 18.3	Command was introduced.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Usage Examples

The following example specifies that HTTP access is restricted by applying the previously configured IPv6 ACL (**MyIPv6ACL**):

(config)**#http ipv6 access-class MyIPv6ACL in**

http ipv6 secure-access-class <*ipv6 acl name*> in

Use the **http ipv6 secure-access-class in** command to restrict access to the Internet Protocol version 6 (IPv6) Hypertext Transfer Protocol secure (HTTPS) server using the specified IPv6 access control list (ACL). Use the **no** form of this command to remove the IPv6 ACL from the HTTPS connection. Variations of this command include:

http ipv6 secure-access-class <*ipv6 acl name*> **in**
http ipv6 secure-access-class <*ipv6 acl name*> **in any-vrf**
http ipv6 secure-access-class <*ipv6 acl name*> **in vrf** <*name*>

Syntax Description

<*ipv6 acl name*>	Specifies the previously configured IPv6 ACL to use for HTTPS access restriction.
in	Specifies that the ACL is applied to incoming IPv6 HTTPS connections.
any-vrf	Optional. Allows incoming IPv6 HTTPS connections from any virtual routing and forwarding (VRF) instance.
vrf <*name*>	Optional. Allows incoming IPv6 HTTPS connections from a specified VRF instance.

Default Values

By default, no IPv6 ACLs are applied to HTTPS connections.

Command History

Release 18.3	Command was introduced.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Usage Examples

The following example specifies that HTTPS access is restricted by applying the previously configured IPv6 ACL (**MyIPv6ACL**):

(config)**#http ip secure-access-class MyIPv6ACL in**

http language

Use the **http language** command to specify the language of the Web-based Graphical User Interface (GUI) on the AOS device. Use the **no** form of this command to return the GUI language to the default value. Variations of this command include:

http language english
http language frenchcanadian
http language italian
http language latinamspanish
http language simplifiedchinese

Syntax Description

english	Specifies the GUI language is English.
frenchcanadian	Specifies the GUI language is French Canadian.
italian	Specifies the GUI language is Italian.
latinamspanish	Specifies the GUI language is Latin American Spanish.
simplifiedchinese	Specifies the GUI language is Simplified Chinese.

Default Values

By default, the GUI is displayed in English.

Command History

Release 3.1	Command was introduced.
Release 13.1	Command was expanded to include Italian.
Release 14.1	Command was expanded to include French Canadian, Latin American Spanish, and Simplified Chinese languages.
Release 18.3	Command syntax was changed to remove the **ip** keyword to support IPv6 in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example specifies that the AOS GUI is displayed in French Canadian:

(config)**#http language frenchcanadian**

http report errors

Use the **http report errors** command to store a Hypertext Transfer Protocol (HTTP) error report on the unit's primary Flash memory when an HTTP server error occurs. The report is subsequently sent to the email address(es) specified by the command *logging email error-report address-list <email address> ; <email address> on page 1583*. Use the **no** form of this command to disable HTTP error reporting.

Syntax Description

No subcommands.

Default Values

By default, HTTP error reporting is enabled.

Command History

Release R10.8.0	Command was introduced.

Usage Examples

The following example enables HTTP error reporting:

(config)**#http report errors**

http secure-ciphersuite

Use the **http secure-ciphersuite** command to enable a secure sockets layer (SSL) cipher suite on Hypertext Transfer Protocol (HTTP) and HTTP secure (HTTPS) connections. Use the **no** form of this command to remove the SSL cipher suite configuration. Variations of this command include:

http secure-ciphersuite aes128-sha
http secure-ciphersuite aes256-sha
http secure-ciphersuite des-cbc-md5
http secure-ciphersuite des-cbc-sha
http secure-ciphersuite des-cbc3-md5
http secure-ciphersuite des-cbc3-sha
http secure-ciphersuite dhe-rsa-aes128-sha
http secure-ciphersuite dhe-rsa-aes256-sha
http secure-ciphersuite edh-rsa-des-cbc-sha
http secure-ciphersuite edh-rsa-des-cbc3-sha
http secure-ciphersuite rc4-md5
http secure-ciphersuite rc4-sha

Syntax Description

aes128-sha	Enables a secure sockets layer version 3.0 (SSLv3) cipher suite with the following properties: Key exchange algorithm (Kx) = Rivest, Sharmir, and Adleman (RSA) Authentication (Auth) = RSA Bulk encryption algorithm (E) = 128-bit Advanced Encryption Standard (AES) Hash function (Hash) = secure hash algorithm 1 (SHA-1)
aes256-sha	Enables an SSLv3 cipher suite with the following properties: Kx = RSA Auth = RSA E = 256-bit AES Hash = SHA-1
des-cbc-md5	Enables a secure sockets layer version 2.0 (SSLv2) cipher suite with the following properties: Kx = RSA Auth = RSA E = 56-bit Data Encryption Standard (DES) Hash = message-digest algorithm (MD5)
des-cbc-sha	Enables an SSLv3 cipher suite with the following properties: Kx = RSA Auth = RSA E = 56-bit DES Hash = SHA-1

des-cbc3-md5	Enables an SSLv2 cipher suite with the following properties: Kx = RSA Auth = RSA E = 168-bit Triple-DES (3DES) Hash = MD5
des-cbc3-sha	Enables an SSLv3 cipher suite with the following properties: Kx = RSA Auth = RSA E = 168-bit 3DES Hash = SHA-1
dhe-rsa-aes128-sha	Enables an SSLv3 cipher suite with the following properties: Kx = DH) Auth = RSA E = 128-bit AES Hash = SHA-1
dhe-rsa-aes256-sha	Enables an SSLv3 cipher suite with the following properties: Kx = DH Auth = RSA E = 256-bit AES Hash = SHA-1
edh-rsa-des-cbc-sha	Enables an SSLv3 cipher suite with the following properties: Kx = DH Auth = RSA E = 56-bit DES Hash = SHA-1
edh-rsa-des-cbc3-sha	Enables an SSLv3 cipher suite with the following properties: Kx = DH Auth = RSA E = 168-bit 3DES Hash = SHA-1
rc4-md5	Enables an SSLv2 or SSLv3 cipher suite with the following properties: Kx = RSA Auth = RSA E = 128-bit Rivest Cipher 4 (RC4) Hash = MD5
rc4-sha	Enables an SSLv3 cipher suite with the following properties: Kx = RSA Auth = RSA E = 128-bit RC4 Hash = SHA-1

Default Values

By default, no cipher suites are enabled.

Command History

Release 18.2	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example enables the SSL cipher suite **rc4-sha** for HTTP connections:

(config)**#http secure-ciphersuite rc4-sha**

http secure-server

Use the **http secure-server** command to enable the Hypertext Transfer Protocol (HTTP) secure (HTTPS) server and specify the server use secure sockets layer (SSL) version 3. Use the **no** form of this command to disable the HTTP server. Variations of this command include:

http secure-server
http secure-server allow-tls1.0
http secure-server allow-tls1.0 allow-tls1.1
http secure-server allow-tls1.0 allow-tls1.1 allow-sslv3
http secure-server allow-tls1.0 allow-sslv3
http secure-server allow-tls1.1
http secure-server allow-tls1.1 allow-sslv3
http secure-server allow-sslv3
http secure-server <*TCP port*>
http secure-server <*TCP port*> **allow-tls1.0**
http secure-server <*TCP port*> **allow-tls1.0 allow-tls1.1**
http secure-server <*TCP port*> **allow-tls1.0 allow-tls1.1 allow-sslv3**
http secure-server <*TCP port*> **allow-tls1.0 allow-sslv3**
http secure-server <*TCP port*> **allow-tls1.1**
http secure-server <*TCP port*> **allow-tls1.1 allow-sslv3**
http secure-server <*TCP port*> **allow-sslv3**

Syntax Description

allow-tls1.0	Optional. Allows the server to use Transport Layer Security protocol version 1.0. If **allow-tls1.0** is enabled, SSLv3 can also optionally be enabled.
allow-tls1.1	Optional. Allows the server to use TLS protocol version 1.1. If allow-tls1.1 is enabled, SSLv3 can also optionally be enabled.
allow-sslv3	Optional. Allows the server to use SSLv3. If SSLv3 is enabled, TLS version 1.0 is automatically enabled.
<*TCP port*>	Optional. Specifies an alternate Transmission Control Protocol (TCP) port to use for HTTPS connections.

Default Values

By default, the HTTP secure server is disabled. When the HTTP secure server is enabled, it uses SSLv3 by default.

Command History

Release 3.1	Command was introduced.
Release 17.6	Command was expanded to include the **allow-sslv2** parameter.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.

Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.
Release R12.3.0	Command was changed to remove the **allow-sslv2** keyword. In addition, the **allow-tls1.0** and **allow-sslv3** parameters were added.
Release R13.9.0	Command was expanded to include the **allow-tls1.1** parameter.

Usage Examples

The following example enables the HTTP secure server:

(config)**#http secure-server**

http server

Use the **http server** command to enable the Hypertext Transfer Protocol (HTTP) server on the AOS device. Enabling the server enables Web access to the AOS unit. Use the **no** form of this command to disable the HTTP server. Variations of this command include:

http server
http server <*TCP port*>

Syntax Description

<*TCP port*>	Optional. Specifies an alternate Transmission Control Protocol (TCP) port for the HTTP server.

Default Values

By default, the HTTP server is disabled.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example enables the HTTP server:

(config)#**http server**

http session-limit <*number*>

Use the **http session-limit** command to set the maximum number of Hypertext Transfer Protocol (HTTP) or HTTP secure (HTTPS) sessions allowed on the AOS device. Use the **no** form of this command to return the maximum number of allowed sessions to the default value.

Syntax Description

<*number*>	Specifies the maximum number of allowed HTTP/HTTPS sessions. Valid range is **0** to **100** sessions.

Default Values

By default, up to **100** HTTP/HTTPS sessions are allowed.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example limits the maximum number of allowed HTTP sessions to **75**:

(config)**#http session-limit 75**

http session-timeout <*value*>

Use the **http session-timeout** command to set the Hypertext Transfer Protocol (HTTP) or HTTP secure (HTTPS) session timeout value. Use the **no** form of this command to return the session timeout period to the default value.

Syntax Description

<*value*>	Specifies the HTTP/HTTPS session timeout period. Valid range is **10** to **86400** seconds.

Default Values

By default, the HTTP/HTTPS session times out after **600** seconds.

Command History

Release 3.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.

Usage Examples

The following example changes the HTTP session timeout period to **1500** seconds:

(config)**#http session-timeout 1500**

http source-interface <*interface*>

Use the **http source-interface** command to specify a source interface for Hypertext Transfer Protocol (HTTP) traffic originated by the AOS unit. Specifying the virtual routing and forwarding (VRF) instance using the **vrf** <*name*> keyword applies the configuration to the named VRF instance. Omitting the **vrf** <*name*> keyword applies the configuration to the default unnamed VRF. The IP address of the specified interface will be used to source all HTTP traffic. Use the **no** form of this command if you do not wish to override the default source IP address. Variations of this command include:

http source-interface <*interface*>
http vrf <*name*> **source-interface** <*interface*>

This command pertains to the HTTP client and not the HTTP server.

Syntax Description

<*interface*>	Specifies the source interface for HTTP traffic. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **ip http source-interface ?** for a complete list of valid interfaces.
vrf <*name*>	Specifies the name of the VRF to which to configure the source interface.

Default Values

By default, no HTTP source interface is defined.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the asynchronous transfer mode (ATM) interface.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release 18.3	Command syntax was changed to remove the **ip** keyword for IPv6 support in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the **ip** keyword for Adtran voice products.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Functional Notes

This command allows you to override the Sender field in the IP packet. If you have multiple interfaces in your unit, changing the Sender tells the receiver where to send replies. This functionality can also be used to allow packets to get through firewalls that would normally block the flow.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured.

Usage Examples

The following example configures the unit to use the **loopback 1** interface as the source IP for HTTP traffic:

(config)**#http source-interface loopback 1**

The following example configures the unit to use the **loopback 1** interface as the source IP for HTTP traffic on VRF RED:

(config)**#http vrf RED source-interface loopback 1**

hw-access-map <*name*>

Use the **hw-access-map** command to create and name a hardware access map. This command also enters the map's configuration mode. Using the **no** form of this command deletes the hardware access map.

For a complete list of all hardware access map configuration commands, refer to the *Hardware ACL and Access Map Command Set on page 4235*.

Syntax Description

<name>	Specifies the name of the hardware access map.

Default Values

By default, all AOS security features are disabled, and there are no configured hardware access maps.

Command History

Release 17.6	Command was introduced.

Functional Notes

This command only creates an empty hardware access map, it does not configure it. For additional hardware access map configuration commands and configuration parameters, refer to the *Hardware ACL and Access Map Command Set on page 4235* or the *Hardware ACLs in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example creates a hardware access map **Map1** and enters the hardware access map configuration mode:

```
(config)#hw-access-map Map1
(config-hw-access-map)#
```

Technology Review

Hardware access maps can only forward traffic. This action can be performed based on the criteria outlined in a single IP hardware access control list (ACL), a single medium access control (MAC) hardware ACL, or both. Like the hardware ACLs, the hardware access map will match traffic in top-down order.

If you configure the access map to reference a nonexistent IP or MAC hardware ACL, the ACL will be created. Note that this newly created ACL will have **permit any** as the default entry because no other entries are present.

Hardware access maps are not active until they are applied to a VLAN. For instructions on how to apply an access map to a VLAN, refer to *vlan <vlan id> on page 1889*.

Changing hardware ACL or hardware access map configuration or application causes new information to be reinstalled on the hardware. It is possible to run out of hardware resources depending on how many resources are needed to apply the desired change. If there are not enough hardware resources to install the new criteria in the hardware, an error message is displayed. You can view the amount of hardware resources available using the command *show hw-filter-resource on page 672*.

interface efm-group

Use the **interface efm-group** command to create an Ethernet in the first mile (EFM) group and enter the group's configuration. Use the **no** form of this command to remove the EFM group. Variations of this command include:

interface efm-group *<group number>*
interface efm-group *<slot/group>*
interface efm-group *<slot/group.subinterface id>*

Syntax Description

<group number>	Specifies the EFM group for use with Metro Ethernet Forum (MEF) configurations. Range is **1** to **1024**.
<slot/group>	Specifies the EFM group for use with carrier Ethernet Ethernet virtual connections (EVCs). The slot is the slot in which the interfaces bonded to the group reside. Group range is **1** to **1024**.
<slot/group.subinterface id>	Creates a Layer 3 subinterface on the Metro Ethernet network (MEN) port for Layer 3 services and enters the subinterface's configuration mode.

Default Values

By default, no EFM groups exist.

Command History

Release A4.01	Command was introduced.
Release R10.10.0	Command was expanded to include EFM group configuration for EVCs and Layer 3 subinterfaces on the MEN port.

Functional Notes

The EFM group is a logical interface that represents the EFM bonding group. The interfaces that are connected to the EFM group provide physical links to carry the bonded traffic. For more information about configuring the EFM group for MEF, refer to *MEF EFM Group Command Set on page 3599*. For more information about configuring the EFM group for EVCs or Layer 3 subinterfaces, refer to *Carrier Ethernet EFM Group Command Set on page 3691*.

Usage Examples

The following example creates EFM group **1** for MEF configurations and enters the group's configuration mode:

```
(config)#interface efm-group 1
(config-efm-group 1)#
```

interface mef-ethernet <*slot/port*>

Use the **interface mef-ethernet** command to enter the Metro Ethernet Forum (MEF) Ethernet Interface Configuration mode.

Syntax Description

<*slot/port*>	Specifies the slot and port of the MEF Ethernet interface.

Default Values

No default values are necessary for this command.

Command History

Release A4.01	Command was introduced.

Functional Notes

The MEF Ethernet interface is a virtual interface that provides connection between the Ethernet in the first mile (EFM) network interface module (NIM2) and the AOS unit.

If you are using 802.1q encapsulation, you must have a native VLAN MEF Ethernet subinterface configured for the EFM NIM2 to communicate with the AOS unit.

For more information about the MEF Ethernet interface, refer to *MEF Ethernet Interface on page 3604*. For more information about the configuration of EFM NIM2s and the MEF Ethernet interface, refer to the *Configuring EFM NIM2s and the MEF Ethernet Interface in AOS* configuration guide available online at https://supportcommunity.adtran.com.

Usage Examples

The following example enters the configuration mode for MEF Ethernet interface in slot **1** port **1**:

(config)**#interface mef-ethernet 1/1**

interface range *<interface type> <slot/port>* - *<slot/port>*

Use the **interface range** command to enter configuration mode for a range of interfaces.

Syntax Description

<interface type>	Specifies the interface type (e.g., Ethernet, Gigabit Ethernet, etc.). Type **interface range ?** for a complete list of valid interfaces.
<slot/port>	Specifies the slot/port number of the first interface in the desired range of interfaces to be configured, followed by a hyphen (-) for consecutive ports or a comma (,) for nonconsecutive ports.
<slot/port>	Specifies the slot/port number of the last interface in the desired range of interfaces to be configured.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 11.1	Command was expanded to include the foreign exchange office (FXO) range.
Release 14.1	Command was expanded to include the Gigabit Ethernet interfaces.
Release 18.2	Command was expanded to include the Single-Pair High-Speed Digital Subscriber Line (SHDSL) interface.
Release R10.10.0	Command was expanded to include the very high-speed digital subscriber line (VDSL), symmetric digial subscriber line (SDSL), and 10 gigabit switchport interfaces.

Functional Notes

All configuration changes made in this mode will apply to all interfaces in the range specified.

Usage Examples

The following example selects seven consecutive Ethernet ports for configuration:

(config)**#interface range eth 0/3-0/12**
(config-eth 0/3-12)#

The following example selects nonconsecutive Ethernet ports for configuration:

(config)**#interface range eth 0/14, 0/16, 0/18**
(config-eth 0/14, 0/16, 0/18)#

interface tunnel <*number*>

Use the **interface tunnel** command to create a tunnel interface and enter the tunnel's configuration mode. Use the **no** version of this command to remove the tunnel interface. Variations of this command include:

interface tunnel <*interface id*>
interface tunnel <*interface id*> **gre ip**
interface tunnel <*interface id*> **multipoint-gre ip**
interface tunnel <*interface id*> **vxlan**

Syntax Description

<interface id>	Specifies the tunnel's numerical label identifier. Valid range is **1** to **1024**.
gre ip	Specifies the tunnel is a point-to-point Generic Routing Encapsulation (GRE) tunnel, and that it is an Internet Protocol version 4 (IPv4) tunnel. This tunnel type encapsulates all IP traffic (both IPv4 and IPv6) in an IPv4/GRE delivery header.
multipoint-gre ip	Specifies the tunnel is a multipoint GRE tunnel. This tunnel type is used in Dynamic Multipoint Virtual Private Network (DMVPN) applications.
vxlan	Specifies the tunnel is a virtual extensible local area network (VxLAN) tunnel. This tunnel type is used to expand Layer 2 network segments across Layer 3 networks.

Default Values

By default, no tunnels are created.

Command History

Release R10.1.0	Command was introduced.
Release R11.9.0	Command was expanded to include the **multipoint-gre** parameter.
Release R13.1.0	Command was expanded to include **vxlan** parameter.

Functional Notes

The **interface tunnel gre ip** command replaces the **tunnel mode gre** command used from the tunnel interface in AOS firmware versions prior to R10.1.0. When the command is entered with the **gre ip** parameter, and a new tunnel interface is being created, the parameter creates the tunnel interface, specifies that all traffic (both IPv4 and IPv6) is encapsulated in an IPv4/GRE delivery header, and enters the tunnel's configuration mode. If the **gre ip** parameter is NOT used and the tunnel interface has NOT been previously created, an error is generated because the tunnel mode must be specified when creating a new tunnel interface. If the **gre ip** parameter is NOT used and the tunnel interface has been previously created, the command enters the tunnel's configuration mode. This logic also applies when using the **multipoint-gre ip** and **vxlan** parameters.

VxLAN tunnel implementation is point-to-point only since AOS does not currently support multicast VxLAN tunnels. VxLAN tunnel support is limited to IPv4 for underlay networks. However, IPv6 overlay networks can be created over IPv4 underlay networks.

Usage Examples

The following example creates a new tunnel interface, specifies the tunnel's mode as GRE, and enters the tunnel's configuration mode:

(config)**#interface tunnel 1 gre ip**
(config-tunnel 1)#

ip access-list extended *<ipv4 acl name>*

Use the **ip access-list extended** command to create an empty Internet Protocol version 4 (IPv4) access control list (ACL) and enter the Extended ACL Configuration mode. Use the **no** form of this command to delete an extended ACL and all the entries contained in it.

For a complete list of all extended IPv4 ACL configuration commands, refer to the IPv4 Access Control List Command Set on page 4252.

Syntax Description

<ipv4 acl name>	Specifies the name of the IPv4 ACL.

Default Values

By default, all AOS security features are disabled, and there are no configured IPv4 ACLs.

Command History

Release 2.1	Command was introduced.

Functional Notes

This command only creates an empty extended IPv4 ACL, it does not configure it. For additional extended ACL configuration commands and configuration parameters, refer to the *IPv4 Access Control List Command Set on page 4252*.

Usage Examples

The following example creates an extended IPv4 ACL **AllowIKfacility loopback objectE** and enters the Extended ACL Configuration mode:

(config)**#ip access-list extended AllowIKE**
(config-ext-nacl)#

Technology Review

IPv4 ACLs are used as packet selectors by different AOS IPv4 features (firewall, virtual private network (VPN), quality of service (QoS)); by themselves they do nothing. ACLs are composed of an ordered list of entries with an implicit **deny all** at the end of each list. An ACL entry contains two parts: an action (**permit** or **deny**) and a packet pattern. A **permit** ACL is used to match packets (meeting the specified pattern) to enter the router system. A **deny** ACL advances AOS to the next access policy entry. AOS provides two types of ACLs: standard and extended. Standard ACLs match based on the source of the packet. Extended ACLs match based on the source and destination of the packet.

ACLs are performed in order from the top of the list down. Generally, the most specific entries should be at the top and the more general at the bottom.

IPv4 ACLs cannot have the same name as IPv6 ACLs. If you are using both IPv4 and IPv6, you must have different ACLs for each IP version.

virtual routing and forwarding (VRF) on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

More information on IPv4 ACL, ACP, and AOS firewall configuration is available in the *IPv4 Firewall* configuration guide, located online at https://supportcommunity.adtran.com.

ip access-list standard *<ipv4 acl name>*

Use the **ip access-list standard** command to create an empty IPv4 access control list (ACL) and enter the Standard ACL Configuration mode. Use the **no** form of this command to delete an extended ACL and all the entries contained in it.

> NOTE *For a complete list of all standard IPv4 ACL configuration commands, refer to the IPv4 Access Control List Command Set on page 4252.*

Syntax Description

<ipv4 acl name>	Specifies the name of the IPv4 ACL.

Default Values

By default, all AOS security features are disabled, and there are no configured IPv4 ACLs.

Command History

Release 2.1	Command was introduced.

Functional Notes

This command only creates an empty standard IPv4 ACL, it does not configure it. For additional standard IPv4 ACL configuration commands and configuration parameters, refer to the *IPv4 Access Control List Command Set on page 4252*.

Usage Examples

The following example creates a standard IPv4 ACL **AllowIKE** and enters the Standard ACL Configuration mode:

```
(config)#ip access-list standard AllowIKE
(config-std-nacl)#
```

Technology Review

IPv4 ACLs are used as packet selectors by different IPv4 AOS features (firewall, virtual private network (VPN), quality of service (QoS)); by themselves they do nothing. ACLs are composed of an ordered list of entries with an implicit **deny all** at the end of each list. An ACL entry contains two parts: an action (**permit** or **deny**) and a packet pattern. A **permit** ACL is used to match packets (meeting the specified pattern) to enter the router system. A **deny** ACL advances AOS to the next access policy entry. AOS provides two types of ACLs: standard and extended. Standard ACLs match based on the source of the packet. Extended ACLs match based on the source and destination of the packet.

ACLs are performed in order from the top of the list down. Generally, the most specific entries should be at the top and the more general at the bottom.

IPv4 ACLs cannot have the same name as IPv6 ACLs. If you are using both IPv4 and IPv6, you must have different ACLs for each IP version.

Virtual routing and forwarding (VRF) on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

More information on ACL, ACP, and AOS firewall configuration is available in the *IPv4 Firewall* configuration guide, located online at https://supportcommunity.adtran.com.

ip classless

Use the **ip classless** command to forward classless packets to the best supernet route available. A classless packet is a packet addressed for delivery to a subnet of a network with no default network route.

Syntax Description

No subcommands.

Default Values

By default, this command is enabled.

Command History

Release 1.1	Command was introduced.

Functional Notes

AOS products only function in classless mode. You cannot disable this feature.

Usage Examples

The following example enables the system to forward classless packets:

(config)**#ip classless**

ip crypto

Use the **ip crypto** command to enable AOS virtual private network (VPN) functionality and allow crypto maps to be added to the interfaces. Use the **no** form of this command to disable the VPN functionality. Variations of this command include:

ip crypto
ip crypto fast-failover

> *Disabling the AOS security features (using the **no ip crypto** command) does not affect VPN configuration settings (with the exception of the removal of all crypto maps from the interfaces). All other configuration parameters will remain intact, and VPN functionality will be disabled.*

Syntax Description

fast-failover	Optional. This setting is used when the same crypto map is applied to two different egress interfaces. It allows the quick deletion of Internet key exchange (IKE) and IPSec SAs when the default route policy class changes.

Default Values

By default, all AOS VPN functionality is disabled.

Command History

Release 4.1	Command was introduced.
Release 11.2	Command was expanded to include the **fast-failover** feature.

Functional Notes

VPN-related settings will not go into effect until you enable VPN functionality using the **ip crypto** command. AOS allows you to perform all VPN-related configuration prior to enabling **ip crypto**, with the exception of assigning a **crypto map** to an interface. The **no ip crypto** command removes all crypto maps from the interfaces. Enabling **ip crypto** enables the IKE server on User Datagram Protocol (UDP) Port 500. The **no** form of this command disables the IKE server on UDP Port 500.

Usage Examples

The following example enables VPN functionality:

(config)**#ip crypto**

ip crypto ffe

Use the **ip crypto ffe** command to enable the RapidRoute Engine for IP Security Protocol (IPSec) security associations (SAs). Use the **no** form of this command to disable the RapidRoute functionality for IPSec SAs. Variations of this command include:

ip crypto ffe
ip crypto ffe max-entries <*entries*>

Syntax Description

max-entries <*entries*>	Optional. Specifies the maximum number of entries per inbound (decrypting) IPSec SA. Valid range is from **1** to **8192**.

Default Values

By default, RapidRoute is not enabled for IPSec SAs. The default number of **max-entries** is **4096**.

Command History

Release 17.6	Command was introduced

Functional Notes

The RapidRoute Engine can be used to help reduce routing overhead, and thus reduce overall routing times. Routing times are reduced by the creation of a flow table on the ingress interface. The maximum number of entries that can be stored in the flow table at any one time can be specified by using the **max-entries** parameter.

Usage Examples

The following example enables RapidRoute for IPSec SAs and sets the maximum number of entries in the flow table to **50**:

(config)**#ip crypto ffe max entries 50**

ip crypto ipsec profile <*name*>

Use the **ip crypto ipsec profile** command to create a new crypto Internet Protocol security (IPsec) profile and enter the profile's configuration mode.Use the **no** form of this command to delete the IPsec profile.

Syntax Description

<*name*>	Specifies a unique, case-sensitive name for the IPsec profile to be created. Profile names cannot exceed **80** characters in length.

Default Values

By default, no IPsec profiles are configured.

Command History

Release R11.9.0	Command was introduced.

Functional Notes

IPsec profiles can be applied to one or more tunnel interfaces.

An IPsec profile must have a transform set defined in order to function. Refer to the command *set transform-set on page 5268* for more information.

Usage Examples

The following example creates the IPsec profile **PROFILE1** and enters its configuration mode:

(config)**#ip crypto ipsec profile PROFILE1**
(config-crypto-profile)#

ip crypto ipsec transform-set *<name> <parameters>*

Use the **ip crypto ipsec transform-set** command to define the transform configuration for securing data (e.g., esp-3des, esp-sha-hmac, etc.) using Internet Protocol version 4 (IPv4) IP security (IPsec). The transform set is then assigned to a crypto map using the map's **set transform-set** command. Refer to *set transform-set on page 5243*. Use the **no** form of this command to disable this feature.

The following additional subcommands are available once you have entered the Transform Set Configuration mode:

mode tunnel

Syntax Description

<name>	Specifies the name of the transform set. Names must be unique, and are specified in an alphanumeric string of up to **80** characters.	
<parameters>	Assigns a combination of up to three security algorithms to the set. Available security algorithms are as follows:	
	ah-md5-hmac	Authentication Header. Uses 16 byte \ and HMAC-MD5-96 authentication.
	ah-sha-hmac	Authentication Header. Uses 20 byte key and HMAC-SHA1-96 authentication.
	esp-des	Encapsulating Security Payload. Data encryption standard using cipher block chaining and an 8-byte key (DES-56-CBC).
	esp-3des	Encapsulating Security Payload. Data encryption standard using cipher block chaining and a 24-byte key (3DES-168-CBC).
	esp-aes-128-cbc	Encapsulating Security Payload. Advanced encryption standard using cipher block chaining and a 16-byte key.
	esp-aes-192-cbc	Encapsulating Security Payload. Advanced encryption standard using cipher block chaining and a 24-byte key.
	esp-aes-256-cbc	Encapsulating Security Payload. Advanced encryption standard using cipher block chaining and a 32-byte key.
	esp-null	Encapsulating Security Payload with no encryption.
	esp-md5-hmac	Encapsulating Security Payload. Uses 16-byte key and HMAC-MD5-96 authentication.
	esp-sha-hmac	Encapsulating Security Payload. Uses 20-byte key and HMAC-SHA1-96 authentication.
mode tunnel	Specifies the encapsulation mode for the transform set is datagram encapsulation (tunnel) mode.	

Default Values

By default, no IPv4 IPsec transform sets are configured.

Command History

Release 4.1	Command was introduced.
Release R10.7.0	Command syntax was changed to include the **ip** keyword.

Functional Notes

Crypto map entries do not directly contain the transform configuration for securing data. Instead, the crypto map is associated with transform sets that contain specific security algorithms.

If no transform set is configured for a crypto map, the entry is incomplete and will have no effect on the system.

Usage Examples

The following example first creates a transform set (**Set1**) consisting of two security algorithms (up to three may be defined), and then assigns the transform set to a crypto map (**Map1**):

(config)**#ip crypto ipsec transform-set Set1 esp-3des esp-sha-hmac**
(cfg-crypto-trans)**#exit**
(config)**#ip crypto map Map1 1 ipsec-ike**
(config-crypto-map)**#set transform-set Set1**

ip crypto map

Use the **ip crypto map** command to define Internet Protocol version 4 (IPv4) crypto map entry names and numbers and to enter the associated mode (either Crypto Map Internet key exchange (IKE) or Crypto Map Manual). Use the **no** form of this command to disable this feature. Variations of this command include the following:

ip crypto map <*name*> <*index*>
ip crypto map <*name*> <*index*> **ipsec-ike**
ip crypto map <*name*> <*index*> **ipsec-manual**

Syntax Description

<*name*>	Specifies the name of the IPv4 crypto map entry. You can assign the same name to multiple crypto maps, as long as the map index numbers are unique.
<*index*>	Assigns a crypto map entry sequence number. Valid range is **0** to **65535**.
ipsec-ike	Specifies the crypto map IKE (refer to *Crypto Map IKE Command Set on page 5226*). This supports IPSec entries that will use IKE to negotiate keys.
ipsec-manual	Specifies the crypto map manual (refer to *IPv4 Crypto Map Manual Command Set on page 5244*). This supports manually configured IPSec entries.

Default Values

No default values are necessary for this command.

Command History

Release 4.1	Command was introduced.
Release R10.7.0	Command syntax was changed to include the **ip** keyword.

Functional Notes

Crypto map entries do not directly contain the transform configuration for securing data. Instead, the crypto map is associated with transform sets that contain specific security algorithms (refer to *data-call on page 1254*).

Crypto map entries do not directly contain the selectors used to determine which data to secure. Instead, the crypto map entry refers to an access control list (ACL). An ACL is assigned to the crypto map using the **match address** command (refer to *ike-policy <number> on page 5230*).

If no transform set or access list is configured for a crypto map, the entry is incomplete and will have no effect on the system.

When you apply a crypto map to an interface (using the **crypto map** command within the interface's mode), you are applying all crypto maps with the given map name. This allows you to apply multiple crypto maps if you have created maps that share the same name, but have different map index numbers.

Usage Examples

The following example creates a new IPv4 IPSec IKE crypto map called **testMap** with a map index of **10**:

(config)**#ip crypto map testMap 10 ipsec-ike**
(config-crypto-map)**#**

Technology Review

A crypto map entry is a single policy that describes how certain traffic is to be secured. There are two types of crypto map entries: **ipsec-manual** and **ipsec-ike**. Each entry is given an index that is used to sort the ordered list. When a nonsecured packet arrives on an interface, the crypto map set associated with that interface is processed in order. If a crypto map entry matches the nonsecured traffic, the traffic is discarded.

When a packet is to be transmitted on an interface, the crypto map set associated with that interface is processed in order. The first crypto map entry that matches the packet will be used to secure the packet. If a suitable security association (SA) exists, it is used for transmission. Otherwise, IKE is used to establish an SA with the peer. If no SA exists, and the crypto map entry is *respond only*, the packet is discarded.

When a secured packet arrives on an interface, its security parameter index (SPI) is used to look up an SA. If an SA does not exist, or if the packet fails any of the security checks (bad authentication, traffic does not match SA selectors, etc.), it is discarded. If all checks pass, the packet is forwarded normally.

ip default-gateway *<ip address>*

Use the **ip default-gateway** command to specify a default gateway on a switch or on a router if (and only if) IP routing is NOT enabled on the router. Use the **ip route** command to add a default route to the route table when using IP routing functionality. Refer to *ip route on page 1447* for more information. Use the **no** form of this command to disable this feature.

Syntax Description

<ip address>	Specifies the default gateway IP address. IP addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).

Default Values

By default, there is no configured default gateway.

Command History

Release 1.1	Command was introduced.

Usage Examples

The following example disables IP routing on a router and configures a default gateway for **10.10.10.1**:

(config)**#no ip routing**
(config)**#ip default-gateway 10.10.10.1**

The following example specifies a default gateway for the management interface on a switch:

(config)**#ip default-gateway 10.10.10.1**

ip dhcp database local

Use the **ip dhcp database local** command to configure a Dynamic Host Configuration Protocol version 4 (DHCPv4) database agent with local bindings. Use the **no** form of this command to disable this option.

Syntax Description

No subcommands.

Default Values

No default values are necessary for this command.

Command History

Release 10.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** parameter for Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** parameter for Adtran voice products.

Usage Examples

The following example configures the DHCPv4 database agent with local bindings:

(config)**#ip dhcp database local**

ip dhcp excluded-address

Use the **ip dhcp excluded-address** command to specify IPv4 addresses that cannot be assigned to Dynamic Host Configuration Protocol version 4 (DHCPv4) clients. Use the **no** form of this command to remove a configured IPv4 address restriction. Variations of this command include:

ip dhcp excluded-address *<start ipv4 address>*
ip dhcp excluded-address *<start ipv4 address> <end ipv4 address>*
ip dhcp excluded-address vrf *<name> <start ipv4 address>*
ip dhcp excluded-address vrf *<name> <start ipv4 address> <end ipv4 address>*

Syntax Description

<start ipv4 address>	Specifies the lowest IPv4 address in the range OR a single IPv4 address to be excluded.
<end ipv4 address>	Optional. Specifies the highest IPv4 address in the range. This field is not required when specifying a single IPv4 address. IPv4 addresses should be expressed in dotted decimal notation (for example, **10.10.10.1**).
vrf *<name>*	Optional. Specifies the nondefault virtual routing and forwarding (VRF) instance to which the IPv4 addresses are associated. If a VRF is not specified, the default unnamed VRF is assumed.

Default Values

By default, there are no excluded IPv4 addresses.

Command History

Release 2.1	Command was introduced.
Release 17.1	Command was expanded to include the **vrf** parameter.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran voice products.

Functional Notes

The AOS DHCPv4 server (by default) allows all IPv4 addresses for the DHCPv4 pool to be assigned to requesting clients. This command is used to ensure that the specified address or addresses are never assigned by the DHCPv4 server. When static-addressed hosts are present in the network, it is helpful to exclude the IPv4 addresses of the host from the DHCPv4 server IPv4 address pool. This will avoid IPv4 address conflict.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured. Therefore, executing the above mentioned commands without specifying a VRF will only affect the default unnamed VRF.

Usage Examples

The following example excludes an IPv4 address of **172.22.5.100** and the range of IPv4 addresses **172.22.5.200** through **172.22.5.250**:

(config)**#ip dhcp excluded-address 172.22.5.100**
(config)**#ip dhcp excluded-address 172.22.5.200 172.22.5.250**

The following example excludes an IPv4 address of **172.22.5.100** and the range of IPv4 addresses **172.22.5.200** through **172.22.5.250** for the VRF instance named **RED**:

(config)**#ip dhcp excluded-address vrf RED 172.22.5.100**
(config)**#ip dhcp excluded-address vrf RED 172.22.5.200 172.22.5.250**

ip dhcp ping packets *<number>*

Use the **ip dhcp ping packets** command to specify the number of ping packets the Dynamic Host Configuration Protocol version 4 (DHCPv4) server will transmit before assigning an IPv4 address to a requesting DHCPv4 client. Transmitting ping packets verifies that no other hosts on the network are currently configured with the specified IPv4 address. Use the **no** form of this command to prevent the DHCPv4 server from using ping packets as part of the IPv4 address assignment process.

Syntax Description

<number>	Specifies the number of DHCPv4 ping packets sent on the network before assigning the IPv4 address to a requesting DHCPv4 client.

Default Values

By default, the number of DHCPv4 server ping packets is set at **2** packets.

Command History

Release 2.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran voice products.

Functional Notes

Before assigning an IPv4 address to a requesting client, the AOS DHCPv4 server transmits a ping packet on the network to verify there are no other network hosts already configured with the specified address. If the DHCPv4 server receives no reply, the IPv4 address is assigned to the requesting client and added to the DHCPv4 database as an assigned address. Configuring the **ip dhcp ping packets** command with a value of **0** prevents the DHCPv4 server from using ping packets as part of the IPv4 address assignment process.

Usage Examples

The following example configures the DHCPv4 server to transmit **4** ping packets before assigning an address:

(config)**#ip dhcp ping packets 4**

ip dhcp ping timeout <*value*>

Use the **ip dhcp ping timeout** command to specify the interval (in milliseconds) the Dynamic Host Configuration Protocol version 4 (DHCPv4) server will wait for a response to a transmitted DHCPv4 ping packet. The DHCPv4 server transmits ping packets before assigning an IPv4 address to a requesting DHCPv4 client. Transmitting ping packets verifies that no other hosts on the network are currently configured with the specified IPv4 address. Use the **no** form of this command to return to the default timeout interval.

Syntax Description

<*value*>	Specifies the number of milliseconds the DHCPv4 server will wait for a response to a transmitted DHCPv4 ping packet. Valid range is **1** to **1000** milliseconds.

Default Values

By default, the **ip dhcp ping timeout** is set to **500** milliseconds.

Command History

Release 2.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran voice products.

Functional Notes

Before assigning an IPv4 address to a requesting client, the AOS DHCPv4 server transmits a ping packet on the network to verify there are no other network hosts already configured with the specified address. If the DHCPv4 server receives no reply, the IPv4 address is assigned to the requesting client and added to the DHCPv4 database as an assigned address.

Usage Examples

The following example configures the DHCPv4 server to wait **900** milliseconds for a response to a transmitted DHCPv4 ping packet before considering the ping a failure:

(config)**#ip dhcp ping timeout 900**

ip dhcp pool <*name*>

Use the **ip dhcp pool** command to create a Dynamic Host Control Protocol version 4 (DHCPv4) server address pool and enter the pool's configuration mode. The server pool is used to define the information to be assigned to DHCPv4 clients by the DHCPv4 server. The pool chosen to serve a specific client's request is determined by the current pool selection algorithm. Refer to the *DHCPv4 Pool Command Set on page 4336* for more information.

Syntax Description

<name>	Specifies the name of the DHCPv4 server address pool using an alphanumeric string (up to 32 characters in length).

Default Values

By default, there are no configured DHCPv4 address pools.

Command History

Release 2.1	Command was introduced.
Release 18.3	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran internetworking products.
Release R10.1.0	Command syntax was changed to remove the hyphen and the **server** keyword in Adtran voice products.

Functional Notes

Use the **ip dhcp pool** command to create multiple DHCPv4 server address pools for various segments of the network. Multiple address pools can be created to service different segments of the network with tailored configurations.

Usage Examples

The following example creates a DHCPv4 server address pool (labeled **SALES**) and enters the DHCPv4 server pool's configuration mode:

```
(config)#ip dhcp pool SALES
(config-dhcp)#
```

ip ffe limit exceptions *<value>*

Use the **ip ffe limit exceptions** command to specify a limit to the number of unhandled Internet Protocol version 4 (IPv4) fast forwarding engine (FFE) exception packets allowed at any given time by the RapidRoute feature. Use the **no** form of this command to return the limit to the default value.

Syntax Description

<value>	Specifies the maximum number of unhandled FFE exception packets allowed at a given time. Valid range is **1** to **1024**.

Default Values

By default, no more than **128** exception packets are allowed.

Command History

Release R10.4.0	Command was introduced.

Functional Notes

Exception packets are any packets that RapidRoute cannot handle, for example, traffic that matches ineligible entries, fragmented packets, packets with header errors, or the first packet in a given traffic flow that is used to build an FFE entry. Once the limit of unhandled FFE exception packets is reached, subsequent exception packets are dropped until the previously unhandled exceptions are resolved.

Usage Examples

The following example specifies the maximum number of IPv4 exception packets allowed by RapidRoute are **200**:

(config)**#ip ffe limit exceptions 200**

ip ffe max-entries *<value>*

Use the **ip ffe max-entries** command to specify a global limit to the number of Internet Protocol version 4 (IPv4) fast forwarding engine (FFE) entries allowed at any given time by the RapidRoute feature. Use the **no** form of this command to return to the default value.

Issuing this command will cause all RapidRoute entries to be cleared from the unit.

Syntax Description

<value>	Specifies the total number of RapidRoute entries for all interfaces. Valid range is **1** to **500000**.

Default Values

By default, the **ip ffe max-entries** is set to **16384**.

Command History

Release 13.1	Command was introduced.
Release R10.4.0	Command was changed to include up to **500000** entries.

Usage Examples

The following example sets the total maximum number of IPv4 RapidRoute entries to **500**:

(config)**#ip ffe max-entries 500**

ip ffe timeout

Use the **ip ffe timeout** command to set the time to live (TTL) for Internet Protocol version 4 (IPv4) RapidRoute fast forwarding engine (FFE) entries based on their IPv4 protocol. Use the **no** form of this command to return to the default value. Variations of this command include:

ip ffe timeout ah <*max timeout*>
ip ffe timeout ah <*max timeout*> <*inactive timeout*>
ip ffe timeout esp <*max timeout*>
ip ffe timeout esp <*max timeout*> <*inactive timeout*>
ip ffe timeout gre <*max timeout*>
ip ffe timeout gre <*max timeout*> <*inactive timeout*>
ip ffe timeout icmp <*max timeout*>
ip ffe timeout icmp <*max timeout*> <*inactive timeout*>
ip ffe timeout other <*max timeout*>
ip ffe timeout other <*max timeout*> <*inactive timeout*>
ip ffe timeout tcp <*max timeout*>
ip ffe timeout tcp <*max timeout*> <*inactive timeout*>
ip ffe timeout udp <*max timeout*>
ip ffe timeout udp <*max timeout*> <*inactive timeout*>

Syntax Description

ah	Specifies timeout values in seconds for Authentication Header (AH) Protocol.
esp	Specifies timeout values in seconds for Encapsulating Security Payload (ESP) Protocol.
gre	Specified timeout values in seconds for Generic Route Encapsulation (GRE) Protocol.
icmp	Specifies timeout values in seconds for Internet Control Message Protocol (ICMP).
other	Specifies timeout values in seconds for all protocols not listed.
tcp	Specifies timeout values in seconds for Transmission Control Protocol (TCP).
udp	Specifies timeout values in seconds for User Datagram Protocol (UDP).
<*max timeout*>	Specifies maximum age timeout in seconds. This is the maximum amount of time an entry will be kept in the RapidRoute table regardless of activity. Valid range is **60** to **86400** seconds.
<*inactive timeout*>	Optional. Specifies idle timeout in seconds. This is the amount of time an entry will remain in the RapidRoute table with no additional activity. Valid range is **10** to **86400** seconds.

Default Values

By default, the maximum age timeouts are set to **1800** seconds and the inactive timeouts are set to **15** seconds.

Command History

Release 13.1	Command was introduced.
Release 17.6	Command was expanded to include the **gre** parameter.

Usage Examples

The following example sets the time to live for IPv4 RapidRoute entries of TCP packets to **1000** seconds.

(config)**#ip ffe timeout tcp 1000**

ip firewall

Use the **ip firewall** command to enable Internet Protocol version 4 (IPv4) AOS security features, including IPv4 access control policies (ACPs) and lists (ACLs), network address translation (NAT), and the stateful inspection firewall. Use the **no** form of this command to disable the security functionality.

*Disabling the AOS IPv4 security features (using the **no ip firewall** command) does not affect security configuration. All configuration parameters will remain intact, but no security data processing will be attempted.*

*For information regarding the use of open shortest path first (OSPF) with **ip firewall** enabled, refer to the **Functional Notes** for router ospf <process id> on page 1690.*

*Regarding the use of Internet key exchange (IKE) negotiation for virtual private network (VPN) with **ip firewall** enabled, there can be up to six channel groups with 2 to 8 interfaces per group. Dynamic protocols are not yet supported (only static). A physical interface can be a member of only one channel group.*

Syntax Description

No subcommands.

Default Values

By default, all AOS IPv4 security features are disabled.

Command History

Release 2.1	Command was introduced.

Functional Notes

This command enables firewall processing for all interfaces with a configured policy class. Firewall processing consists of the following functions:

Attack Protection: Detects and discards traffic that matches profiles of known networking exploits or attacks.

Session Initiation Control: Allows only sessions that match traffic patterns permitted by ACPs to be initiated through the router.

Ongoing Session Monitoring and Processing: Each session that has been allowed through the router is monitored for any irregularities that match patterns of known attacks or exploits. This traffic will be dropped. Also, if NAT is configured, the firewall modifies all traffic associated with the session according to the translation rules defined in NAT access policies. Finally, if sessions are inactive for a user-specified amount of time, the session will be closed by the firewall.

Application-Specific Processing: Certain applications need special handling to work correctly in the presence of a firewall. AOS uses application-level gateways (ALGs) for these applications.

AOS includes several security features to provide controlled access to your network. The following features are available when security is enabled (using the **ip firewall** command):

1. Stateful Inspection Firewall

AOS (and your unit) act as an ALG and employ a stateful inspection firewall that protects an organization's network from common cyber attacks, including Transmission Control Protocol (TCP) syn-flooding, IP spoofing, Internet Control Message Protocol (ICMP) redirect, land attacks, ping-of-death, and IP reassembly problems. In addition, further security is added with use of NAT and port address translation (PAT) capability.

2. IPv4 Access Policies

AOS IPv4 ACPs are used to allow, discard, or manipulate (using NAT) data for each physical interface. Each ACP consists of an action (**allow**, **discard**, **nat**) and a selector (access control list (ACL)). In a sense, the ACPs answer the question, “What should I do?” while the ACLs answer the question, “On which packets?”

When packets are received on an interface with an ACP applied, the ACP is used to determine whether the data is processed or discarded. Both ACLs and ACPs are order dependent. When a packet is evaluated, the matching engine begins with the first entry in the list and progresses through the entries until it finds a match. The first entry that matches is executed. The ACP has an implicit **discard** at the end of the list. Typically, the most specific entries should be at the top and the most general at the bottom.

3. IPv4 Access Lists

IPv4 ACLs are used as packet selectors by ACPs. They must be assigned to an ACP in order to be active. ACLs are composed of an ordered list of entries. Each entry contains two parts: an action (**permit** or **deny**) and a packet pattern. A **permit** action is used to allow packets (meeting the specified pattern) to enter the router system. A **deny** action is used to disregard packets (that do not match the pattern) and proceed to the next entry on the ACP. The ACL has an implicit **deny** at the end of the list.

The AOS provides two types of ACLs: **standard** and **extended**. A **standard** ACL allows source IP address packet patterns only. An **extended** ACL may specify patterns using most fields in the IP header and the TCP or User Datagram Protocol (UDP) header.

Usage Examples

The following example enables the AOS IPv4 security features:

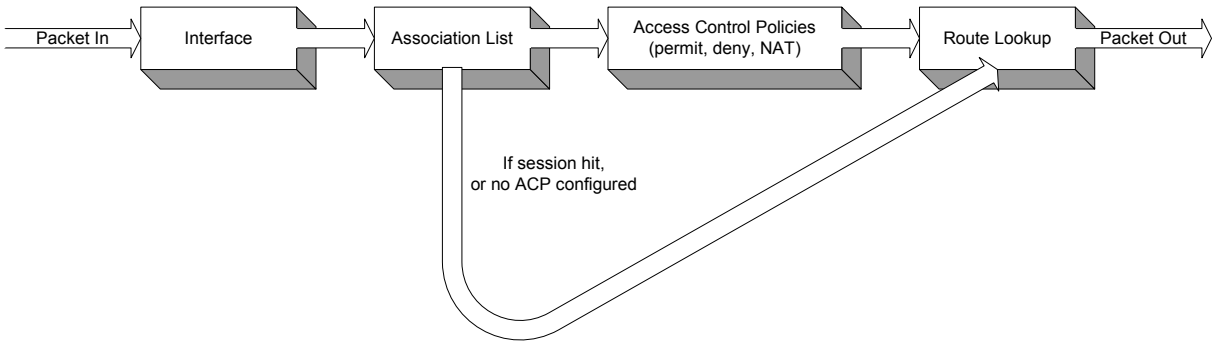
(config)**#ip firewall**

Technology Review

Concepts: IPv4 access control using the AOS firewall has two fundamental parts: ACLs and ACPs. ACLs are used as packet selectors by other AOS systems; by themselves they do nothing. ACPs consist of a selector (ACL) and an action (**allow**, **discard**, **nat**). ACPs integrate both **allow** and **discard** policies with NAT. ACPs have no effect until they are assigned to a network interface.

Both ACLs and ACPs are order dependent. When a packet is evaluated, the matching engine begins with the first entry in the list and progresses through the entries until it finds a match. The first entry that matches is executed.

Packet Flow:



Case 1: Packets from interfaces with a configured policy class to any other interface

IPv4 ACPs are applied when packets are received on an interface. If an interface has not been assigned a policy class, by default it will allow all received traffic to pass through. If an interface has been assigned a policy class, but the firewall has not been enabled with the **ip firewall** command, traffic will flow normally from this interface with no firewall processing.

Case 2: Packets that travel in and out a single interface with a configured policy class

These packets are processed through the IPv4 ACPs as if they are destined for another interface (identical to Case 1).

Case 3: Packets from interfaces without a configured policy class to interfaces with one policy class

These packets are routed normally and are not processed by the IPv4 firewall. The **ip firewall** command has no effect on this traffic.

Case 4: Packets from interfaces without a configured policy class to other interfaces without a configured policy class

This IPv4 traffic is routed normally. The **ip firewall** command has no effect on this traffic.

Attack Protection:

When the **ip firewall** command is enabled, IPv4 firewall attack protection is enabled. AOS blocks traffic (matching patterns of known networking exploits) from traveling through the device. For some of these attacks, the user may manually disable checking/blocking while other attack checks are always on anytime the firewall is enabled.

The table (on the following pages) outlines the types of IPv4 traffic discarded by the firewall attack protection engine. Many attacks use similar invalid traffic patterns; therefore, attacks other than the examples listed below may also be blocked by the firewall. To determine if a specific attack is blocked by the AOS firewall, please contact Adtran technical support.

Invalid IPv4 Traffic Pattern	Manually Enabled?	AOS Firewall Response	Common Attacks
Larger than allowed packets	No	Any packets that are longer than those defined by standards will be dropped.	Ping of Death
Fragmented IP packets that produce errors when attempting to reassemble	No	The firewall intercepts all fragments for an IP packet and attempts to reassemble them before forwarding to destination. If any problems or errors are found during reassembly, the fragments are dropped.	SynDrop, TearDrop, OpenTear, Nestea, Targa, Newtear, Bonk, Boink
Smurf Attack	No	The firewall will drop any ping responses that are not part of an active session.	Smurf Attack
IP Spoofing	No	The firewall will drop any packets with a source IP address that appears to be spoofed. The IP route table is used to determine if a path to the source address is known (out of the interface from which the packet was received). For example, if a packet with a source IP address of 10.10.10.1 is received on interface fr 1.16 and no route to 10.10.10.1 (through interface fr 1.16) exists in the route table, the packet is dropped.	IP Spoofing
ICMP Control Message Floods and Attacks	No	The following types of ICMP packets are allowed through the firewall: echo, echo-reply, TTL expired, dest. Unreachable, and quench. These ICMP messages are only allowed if they appear to be in response to a valid session. All others are discarded.	Twinge
Attacks that send TCP URG packets	Yes	Any TCP packets that have the URG flag set are discarded by the firewall.	Winnuke, TCP XMAS Scan
Falsified IP Header Attacks	No	The firewall verifies that the packet's actual length matches the length indicated in the IP header. If it does not, the packet is dropped.	Jolt/Jolt2

Invalid IPv4 Traffic Pattern	Manually Enabled?	AOS Firewall Response	Common Attacks
Echo	No	All UDP echo packets are discarded by the firewall.	Char Gen
Land Attack	No	Any packets with the same source and destination IP addresses are discarded.	Land Attack
Broadcast Source IP	No	Packets with a broadcast source IP address are discarded.	
Invalid TCP Initiation Requests	No	TCP SYN packets that have ack, urg rst, or fin flags set are discarded.	
Invalid TCP Segment Number	No	The sequence numbers for every active TCP session are maintained in the firewall session database. If the firewall received a segment with an unexpected (or invalid) sequence number, the packet is dropped.	
IP Source Route Option	No	All IP packets containing the IP source route option are dropped.	

Application-Specific Processing

The following applications and protocols require special processing to operate concurrently with IPv4 NAT/firewall functionality. The AOS IPv4 firewall includes ALGs for handling these applications and protocols:

AOL Instant Messenger (AIM®)
VPN ALGS: ESP and IKE
FTP
H.323: H.245 Q.931 ASN1 PER decoding and Encoding
ICQ®
IRC
Microsoft® Games
Net2Phone
PPTP
Quake®
Real-Time Streaming Protocol
SMTP
HTTP
CUseeme
SIP
L2TP
PcAnywhere™
SQL
Microsoft Gaming Zone

To determine if a specific application requires special processing, contact Adtran technical support at www.adtran.com.

ip firewall alg

Use the **ip firewall alg** command to enable the Internet Protocol version 4 (IPv4) application-level gateway (ALG) for a particular application. Use the **no** form of this command to disable ALG for the application.

Variations of this command applicable for nonvoice capable Adtran products include the following:

ip firewall alg ftp
ip firewall alg h323
ip firewall alg h323 timeout <*number*>
ip firewall alg msn
ip firewall alg mszone
ip firewall alg pptp
ip firewall alg rtsp
ip firewall alg sip

Variations of this command applicable for voice capable Adtran products include the following:

ip firewall alg ftp
ip firewall alg h323
ip firewall alg h323 timeout <*number*>
ip firewall alg msn
ip firewall alg mszone
ip firewall alg pptp
p firewall alg rtsp

The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

ftp	Enables the File Transfer Protocol (FTP) ALG.
h323	Enables the H.323 ALG. H.323 is a protocol that sets standards for multimedia communications over packet-switched networks, allowing dissimilar communication devices to communicate with each other via a standard communication protocol.
h323 timeout <*number*>	Optional. Allows the configuration of the timeout for the policy-session that controls the H.323 call, and specifies the length of time before the H.323 call is terminated after a timeout. Range is **1** to **4294967295** seconds.
msn	Enables the Microsoft Service Network (MSN) ALG.
mszone	Enables the MSZONE ALG.
pptp	Enables the PPTP ALG.
rtsp	Enables the Real Time Streaming Protocol (RTSP) ALG.

sip	Enables the Session Initiation Protocol (SIP) ALG. This ALG is only used in Adtran router and switch products, not voice products.

Default Values

By default, all AOS IPv4 security features are disabled until the IPv4 firewall is enabled. By default, the ALG for FTP, PPTP, RTSP, and SIP are enabled. Conversely, the ALG for MSN, MSZONE, and H.323 are disabled by default. There are no SIP ALGs present on voice capable Adtran products. By default, the timeout value for H.323 is set for 8 hours.

Command History

Release 8.1	Command was introduced.
Release 10.1	Command was expanded to include H.323.
Release 14.1	Command was expanded to include MSN.
Release 15.1	Command was expanded to include H.323 timeout feature.
Release 17.4	Command was expanded to include MSZONE.
Release R10.1.0	Command was expanded to include RTSP.

Functional Notes

Enabling the ALG for a specific protocol gives the firewall additional information about that complex protocol and causes the firewall to perform additional processing for packets of that protocol. When the ALG is disabled, the firewall treats the complex protocol as any other simple protocol. The firewall needs no special knowledge to work well with simple protocols.

Disabling the IP firewall ALG may cause the firewall to block some of the traffic for the specified protocol.

Microsoft Service Network (MSN) ALG Information

In some instances where the firewall is enabled and traffic is source NATed through the unit, some features of MSN's instant messenger program will not work (i.e., file sharing, direct connection, etc.). Enabling the MSN ALG allows the firewall to inspect the MSN messaging protocol to allow some of these features to work through network address translation (NAT). If the traffic is not NATed, then this ALG is not required and should be disabled.

Session Initiation Protocol (SIP) ALG Information

By default, the AOS SIP ALG is enabled. This ALG allows the firewall to examine the ALL SIP packets it identifies and maintain knowledge of SIP transmissions on the network based on the SIP header.

Usage Examples

The following example disables ALG for FTP:

(config)**#no ip firewall alg ftp**

The following example enables ALG for MSN:

(config)**#ip firewall alg msn**

Technology Review

SIP is one protocol in a suite of protocols that was designed to replace H.323 for IP telephony. SIP operates in Layer 7 of the OSI model (application level) to create, modify, and terminate sessions between nodes. SIP not only provides recommendations for IP telephony, but multimedia distribution and conferences as well. SIP version 1.0 was defined in RFC 2453, and was refined to SIP version 2.0 in RFC 3261.

SIP operations occur between SIP UAs and SIP servers. Types of SIP servers include proxy, redirect, registrar, and presence. The part of a SIP UA that sends messages is known as the user agent client (UAC). The part of a SIP UA that receives messages is known as a user agent server (UAS).

SIP was originally designed for use over User Datagram Protocol (UDP). SIP servers, by default, listen on port 5060. Due to security concerns, SIP is now transitioning to Transmission Control Protocol (TCP) and transport layer security (TLS). SIP servers using TLS-over-TCP listen on port 5061. SIP UAs listen on a range of ports.

SIP uses the Session Description Protocol (SDP) to format the SIP message body in order to negotiate a Realtime Transport Protocol (RTP)/Realtime Transport Control Protocol (RTCP) connection between two or more UAs. The ports used for this will always be selected in a pair, with the even port used for RTP and the odd port for RTCP. SIP, because it uses SDP and RTP, causes many problems for standard firewalls. Neither SIP nor RTP are guaranteed to be symmetric, thus causing problems for stateful inspection firewalls that rely on symmetric flows. SIP and SDP carry IP addresses and ports embedded in the packet, and standard NAT implementations only modify the IP and TCP/UDP headers. A true SIP ALG is required to modify the packets as needed for NAT, but also to open holes in the firewall as needed for traffic flow based on the information carried in the SIP header.

Enabling the AOS SIP ALG (using the **ip firewall alg sip** command) configures the firewall to examine the ALL SIP packets it identifies and maintain knowledge of SIP transmissions on the network. Since SIP packet headers include port information for the call setup, the ALG must intelligently read the packets and remember the information.

ip firewall attack-log threshold *<number>*

Use the **ip firewall attack-log threshold** command to specify the number of possible attack conditions AOS will identify and block before generating a log message when using Internet Protocol version 4 (IPv4). Use the **no** form of this command to return to the default threshold.

> NOTE *The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.*

Syntax Description

<number>	Specifies the number of possible attack conditions AOS IPv4 will identify before generating a log message. Valid range is **0** to **4294967295**.

Default Values

By default, the **ip firewall attack-log threshold** is set at **100**.

Command History

Release 2.1	Command was introduced.

Usage Examples

The following example specifies a threshold of **25** attacks before generating a log message for the IPv4 firewall:

(config)**#ip firewall attack-log threshold 25**

ip firewall check reflexive-traffic

Use the **ip firewall check reflexive-traffic** command to enable the AOS stateful inspection firewall to process Internet Protocol version 4 (IPv4) traffic from a primary subnet to a secondary subnet on the same interface through the firewall. Use the **no** form of this command to disable this feature.

The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

No subcommands.

Default Values

All AOS IPv4 security features are disabled by default until the **ip firewall** command is issued at the Global Configuration mode prompt. In addition, the reflexive traffic check is disabled until the **ip firewall check reflexive-traffic** command is issued.

Command History

Release 8.1	Command was introduced.

Functional Notes

This command allows the firewall to process IPv4 traffic from a primary subnet to a secondary subnet on the same interface through the firewall. If enabled, this IPv4 traffic will be processed through the access policy on that interface and any actions specified will be executed on the traffic.

Usage Examples

The following example enables the AOS IPv4 reflexive traffic check:

(config)**#ip firewall check reflexive-traffic**

ip firewall check rst-seq

Use the **ip firewall check rst-seq** command to enable Transmission Control Protocol (TCP) reset sequence number checking. Use the **no** form of this command to disable this feature.

The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

No subcommands.

Default Values

All AOS security features are disabled by default until the **ip firewall** command is issued at the Global Configuration mode prompt. In addition, TCP reset sequence number checking is disabled until the **ip firewall check rst-seq** command is issued.

Command History

Release 8.1	Command was introduced.

Usage Examples

The following example enables TCP reset sequence number checking:

(config)**#ip firewall check rst-seq**

ip firewall check syn-flood

Use the **ip firewall check syn-flood** command to enable the AOS stateful inspection firewall to filter out phony Transmission Control Protocol (TCP) service requests and allow only legitimate requests to pass through. Use the **no** form of this command to disable this feature.

> NOTE *The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.*

Syntax Description

No subcommands.

Default Values

All AOS security features are inactive until the **ip firewall** command is issued at the Global Configuration mode prompt. In addition, the SYN-flood check is enabled by default but remains inactive until the **ip firewall** command is issued.

Command History

Release 2.1	Command was introduced.

Functional Notes

SYN flooding is a well-known denial-of-service attack on TCP-based services. TCP requires a three-way handshake before actual communications begin between two hosts. A server must allocate resources to process new connection requests that are received. A potential intruder is capable of transmitting large amounts of service requests (in a very short period of time), causing servers to allocate all resources to process the phony incoming requests. Using the **ip firewall check syn-flood** command configures the AOS stateful inspection firewall to filter out phony service requests and allow only legitimate requests to pass through.

Usage Examples

The following example disables the AOS SYN-flood check:

(config)**#no ip firewall check syn-flood**

ip firewall check winnuke

Use the **ip firewall check winnuke** command to enable the AOS stateful inspection firewall to discard all out-of-band (OOB) data (to protect against WinNuke attacks). Use the **no** form of this command to disable this feature.

> NOTE *The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.*

Syntax Description

No subcommands.

Default Values

All AOS security features are inactive until the **ip firewall** command is issued at the Global Configuration mode prompt. In addition, WinNuke attack checking is disabled until the **ip firewall check winnuke** command is issued.

Command History

Release 2.1	Command was introduced.

Functional Notes

WinNuke attack is a well-known denial-of-service attack on hosts running Microsoft Windows® operating systems. An intruder sends OOB data over an established connection to a Windows user. Windows cannot properly handle the OOB data, and the host reacts unpredictably. Normal shut-down of the hosts will generally return all functionality. Using the **ip firewall check winnuke** command configures the AOS stateful inspection firewall to filter all OOB data to prevent network problems.

Usage Examples

The following example enables the firewall to filter all OOB data:

(config)**#ip firewall check winnuke**

ip firewall fast-allow-failover

Use the **ip firewall fast-allow-failover** command to automatically clear all open Internet Protocol version 4 (IPv4) firewall policy allow sessions when a route table change occurs. This allows the router to immediately send traffic to the failover interface. Otherwise, the router tries to send traffic from existing allowed policy sessions out from the failed IP address until the session times out, resulting in a loss of connectivity. This command should be configured when destination-specific rules are configured. Destination-specific rules are most often used in failover and IP load sharing configurations. Refer to the command *ip policy-class <ipv4 acp name> on page 1434* for more information. Use the **no** form of this command to disable this feature.

The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

No subcommands.

Default Values

By default, all AOS IPv4 security features are disabled until the IPv4 firewall is enabled. By default, fast allow failover is disabled.

Command History

Release R10.1.0	Command was introduced.

Functional Notes

In cases where failover takes place between an interface which uses network address translation (NAT) and an interface which does not use NAT, both **ip firewall fast-nat-failover** and **ip firewall fast-allow-failover** commands must be enabled. Using **fast-nat-failover** causes the policy session using NAT to be deleted when the session fails over and the route table changes to indicate a route that does not use NAT. Using **fast-allow-failover** causes the policy session to be deleted when the session is an allowed policy session and the route table changes to indicate a route that uses NAT.

Usage Examples

The following example enables **fast-allow-failover**:

(config)**#ip firewall fast-allow-failover**

ip firewall fast-nat-failover

Use the **ip firewall fast-nat-failover** command to automatically clear all open Internet Protocol version 4 (IPv4) firewall policy sessions when a route table change occurs. This allows the router to immediately send traffic to the failover interface. Otherwise, the router tries to send traffic from existing sessions out from the failed IP address until the session times out, resulting in a loss of connectivity. This command should be configured when destination-specific rules are configured. Destination-specific rules are most often used in failover and IP load sharing configurations. Refer to the command *ip policy-class <ipv4 acp name> on page 1434* for more information. Use the **no** form of this command to disable this feature.

The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

No subcommands.

Default Values

By default, all AOS IPv4 security features are disabled until the IPv4 firewall is enabled. By default, fast NAT failover is disabled.

Command History

Release 9.3	Command was introduced.

Functional Notes

In cases where failover takes place between an interface which uses network address translation (NAT) and an interface which does not use NAT, both **ip firewall fast-nat-failover** and **ip firewall fast-allow-failover** commands must be enabled. Using **fast-nat-failover** causes the policy session using NAT to be deleted when the session fails over and the route table changes to indicate a route that does not use NAT. Using **fast-allow-failover** causes the policy session to be deleted when the session is an allowed policy session and the route table changes to indicate a route that uses NAT.

Usage Examples

The following example enables **fast-nat-failover**:

(config)**#ip firewall fast-nat-failover**

ip firewall fin-timeout <*value*>

Use the **ip firewall fin-timeout** command to specify the time period allowed for Transmission Control Protocol (TCP) FIN. Use the **no** form of this command to return to the default setting.

> *The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.*

Syntax Description

<*value*>	Specifies the time period in seconds allowed for TCP FIN. Range is **0** to **4294967295** seconds.

Default Values

By default, **ip firewall fin-timeout** is set to **4** seconds.

Command History

Release 10.1	Command was introduced.

Usage Examples

The following example sets the TCP FIN time period to **120** seconds:

(config)**#ip firewall fin-timeout 120**

ip firewall local-traffic-only

Use the **ip firewall local-traffic-only** command to enable the Internet Protocol version 4 (IPv4) firewall for the processing of local traffic only. Forwarded traffic is not sent to the firewall when this feature is enabled. Use the **no** form of this command to disable the IPv4 firewall. Variations of this command include:

ip firewall local-traffic-only
ip firewall vrf <*name*> **local-traffic-only**

Syntax Description

vrf <*name*>	Optional. Specifies that the local traffic firewall is enabled on the specified virtual routing and forwarding (VRF) instance. If no VRF is specified, the firewall is enabled on the default (unnamed) VRF. Refer to *ip firewall vrf <name> on page 1390* for more information.

Default Values

By default, the IPv4 firewall is disabled.

Command History

Release R11.4.0	Command was introduced.

Functional Notes

When the firewall is configured to process local traffic only (traffic arriving at the unit's local IP stack), routed traffic is allowed to flow through the AOS unit uninspected, but locally destined traffic is inspected by the firewall. This feature allows the firewall to protect local services running on the AOS unit even when routed traffic bypasses the firewall. When local traffic processing is enabled, several other security features are impacted, such as IPsec, policy classes, IP route cache, Generic Routing Encapsulation (GRE), and network address translation (NAT).

- Local traffic only firewall processing cannot be used with cryptography (**ip crypto**) because for IPsec to function, traffic must proceed through the firewall. If the firewall is configured to process local traffic only, routed traffic that requires IPsec protection will not flow through the firewall and therefore will not receive IPsec protection.
- Policy classes are applied only to traffic destined to the local stack when local traffic processing is enabled. The **self** policy class is applied to local traffic originating from the local stack, allowing all traffic, and cannot be changed.
- IP route cache entries are not created for local destinations or for the loopback interface when local traffic processing enabled.
- Local GRE traffic encapsulated by a GRE tunnel interface will bypass the firewall when local traffic processing is enabled.
- The full firewall is required any time NAT is needed to translate packets that would typically be forwarded by the AOS unit. The local firewall is not sufficient.

For additional IPv4 firewall configuration information, refer to *ip firewall on page 1367*.

Usage Examples

The following example enables the firewall for local traffic processing on the default VRF:

(config)**#ip firewall local-traffic-only**

ip firewall nat-preserve-source-port

Use the **ip firewall nat-preserve-source-port** command to enable the firewall to preserve the source port of a Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) session for traffic going through source network address translation (NAT). By enabling this feature, the router will try to allocate NAT ports that match the original source ports of the traffic. If the source port is already allocated for a different traffic flow, it will choose the next available source port. Use the **no** form of this command to disable this feature. Variations of this command include the following:

ip firewall nat-preserve-source-port
ip firewall nat-preserve-source-port record-source-address

The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

record-source-address	Optional. Specifies that the original source port be preserved for multiple TCP/UDP traffic flows with the same source address.

Default Values

By default, the nat-preserve-source-port feature is enabled.

Command History

Release 14.1	Command was introduced.

Functional Notes

Specifying **record-source-address** consumes 250 k of memory per public NAT IP address. Be sure there is adequate memory available before enabling this feature.

Usage Examples

The following example enables **nat-preserve-source-port**:

(config)**#ip firewall nat-preserve-source-port**

ip firewall policy-log threshold *<value>*

Use the **ip firewall policy-log threshold** command to specify the number of Internet Protocol version 4 (IPv4) access control policy (ACP) events identified by AOS before generating a log message. Use the **no** form of this command to return to the default value.

> NOTE *The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.*

Syntax Description

<value>	Specifies the number of IPv4 policy events AOS identifies before creating the log. Valid range is **0** to **4294967295**.

Default Values

By default, the **ip firewall policy-log threshold** is set to **100**.

Command History

Release 2.1	Command was introduced.

Usage Examples

The following example specifies that a log is generated when **150** IPv4 ACP events are detected on the default VRF:

(config)**#ip firewall policy-log threshold 150**

ip firewall rst-timeout <*value*>

Use the **ip firewall rst-timeout** command to specify the time period allowed for Transmission Control Protocol (TCP) reset. Use the **no** form of this command to return to the default setting.

The AOS firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

<*value*>	Specifies the time period in seconds allowed for TCP reset. Range is **0** to **4294967295** seconds.

Default Values

By default, **ip firewall rst-timeout** is set to **20** seconds.

Command History

Release 10.1	Command was introduced.

Usage Examples

The following example sets the TCP reset time period to **120** seconds:

(config)**#ip firewall rst-timeout 120**

ip firewall stealth

Use the **ip firewall stealth** command to disable Internet Protocol version 4 (IPv4) Transmission Control Protocol (TCP) reset for denied IPv4 firewall associations. The stealth setting allows the route to be invisible as a route hop to associated devices. Use the **no** form of this command to disable this feature.

The AOS IPv4 firewall must be enabled (using the command ip firewall on page 1367) for the stateful inspection firewall to be activated.

Syntax Description

No subcommands.

Default Values

By default, the stealth option is disabled.

Command History

Release 9.3	Command was introduced.

Usage Examples

The following example enables the **stealth** option for the IPv4 firewall:

(config)**#ip firewall stealth**

ip firewall vrf *<name>*

Use the **ip firewall vrf** command to enable the firewall for a particular Internet Protocol version 4 (IPv4) virtual routing and forwarding (VRF) instance. The IPv4 firewall can be enabled or disabled independently for each VRF. Firewall settings are applied globally across all VRF instances and cannot be changed on an individual VRF basis. Refer to the command *ip firewall on page 1367* for more information on configuring IPv4 firewall settings. Use the **no** form of this command to disable the firewall for the specified VRF.

Syntax Description

<name>	Specifies the VRF instance.

Default Values

By default, the IPv4 firewall is disabled.

Command History

Release 17.1	Command was introduced.

Functional Notes

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured.

Usage Examples

The following example enables the IPv4 firewall on the VRF named RED:

(config)**#ip firewall vrf RED**

ip flow cache sample one-out-of <*number*>

Use the **ip flow cache sample one-out-of** command to configure the integrated traffic monitoring (ITM) cache sampling rate. The **no** form of this command disables sampling. Variations of this command include:

ip flow cache sample one-out-of <*number*> **deterministic**
ip flow cache sample one-out-of <*number*> **random**

Syntax Description

deterministic	Specifies that traffic flow sampling be done at a fixed rate.
random	Specifies that traffic flow sampling be done at a random rate.
<*number*>	Specifies the number of traffic flow packets to be observed before another packet is sampled. Range is **1** to **255** packets.

Default Values

By default, sampling is disabled and every packet is recorded.

Command History

Release 16.1	Command was introduced.
Release 17.1	Command was expanded to include the **deterministic** keyword.

Functional Notes

Sampling provides a snapshot of traffic flow activity. It allows the cache to collect only one out of a specified number of IP packets that the interface is receiving or sending. Often, network traffic arrives in fixed patterns. This pattern can make statistics inaccurate if deterministic sampling is used. Therefore, random sampling is recommended over deterministic sampling to ensure an accurate sampling of traffic flow patterns. By reducing the amount of traffic flow data collected, sampling minimizes memory and CPU usage.

For users of large routers (for example, the NetVanta 5305), a sampling rate of greater than or equal to one out of every 100 packets is recommended.

Usage Examples

The following example configures ITM to sample one packet out of every **100** at a **random** sample rate:

(config)**#ip flow cache sample one-out-of 100 random**

ip flow cache timeout

Use the **ip flow cache timeout** command to configure the integrated traffic monitoring (ITM) cache for entry expiration. The **no** form of this command resets the expiration time to the default setting. Variations of this command include:

ip flow cache timeout active <*minutes*>
ip flow cache timeout inactive <*seconds*>

Syntax Description

active <*minutes*>	Specifies the amount of time a single traffic flow that continues to have packets detected at the observation point is stored before exportation. Range is **1** to **60** minutes.
inactive <*seconds*>	Specifies the amount of time that idle traffic flows (which no longer have packets detected at the observation point) are stored before exportation. Range is **10** to **600** seconds.

Default Values

By default, active flows are set to expire in **30** minutes, and inactive flows are set to expire in **15** seconds.

Command History

Release 16.1	Command was introduced.

Functional Notes

Traffic flow entry expiration can occur in one of three ways: (1) the configured expiration time has passed; (2) the Transmission Control Protocol (TCP) connection between the cache and the flow collector has expired due to FINISH/RESET signaling; or (3) critical configuration changes have been made (for example, changing the sampling rate). The default mode of expiration is based on a configured number of minutes for the traffic flow entry to be stored in the cache.

Usage Examples

The following example configures an expiration time of **15** minutes for **active** traffic flow entries:

(config)**#ip flow cache timeout active 15**

ip flow export

Use the **ip flow export** command to configure traffic flow data exportation parameters for integrated traffic monitoring (ITM). Use the **no** form of this command to disable the export functionality or to remove an associated destination if multiple entries are specified. Variations of this command include:

ip flow export destination <*ip address*> <*port*>
ip flow export destination <*ip address*> <*port*> **source** <*interface*>
ip flow export vrf <*name*> **destination** <*ip address*> <*port*>
ip flow export vrf <*name*> **destination** <*ip address*> <*port*> **source** <*interface*>

Syntax Description

destination <*ip address*> <*port*>	Specifies the IP address and User Datagram Protocol (UDP) port through which the destination will receive data export packets.
source <*interface*>	Specifies a source interface to send the data export packets. Specify an interface in the format <*interface type [slot/port* | *slot/port.subinterface id* | *interface id* | *interface id.subinterface id]*>. For example, for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; and for an ATM subinterface, use **atm 1.1**. Valid interfaces are those that can have an IP address. Type **source ?** for a complete list of valid interfaces.
vrf <*name*>	Specifies the virtual routing and forwarding (VRF) location to be used in data export.

Default Values

By default, **ip flow export** is disabled.

By default, if no source is specified, the router interface at the hop closest to the data collector will be sourced.

Command History

Release 16.1	Command was introduced.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.

Functional Notes

Up to two different destinations can be specified for traffic flow data export.

Using the source command specifies an interface from which to send the data export packets. If using a VRF destination, the source must be on the same VRF as the destination or it will be ignored and the routing table will determine the source interface. Most often, a source will only need to be specified for security purposes. For example, if an access control list (ACL) is active on the external data collector, a source interface may need to be specified.

Usage Examples

The following example configures the export destination to be the external data collector at the IP address **208.61.209.5** through the User Datagram Protocol (UDP) port **1010**.

(config)**#ip flow export destination 208.61.209.5 1010**

ip flow export template

Use the **ip flow export template** command to configure template exportation rates for integrated traffic monitoring (ITM). Use the **no** form of this command to return rate values to the default setting. Variations of this command include:

ip flow export template refresh-rate <*packets*>
ip flow export template timeout-rate <*minutes*>

Syntax Description

refresh-rate <*packets*>	Specifies the number of packets to be sent before the template information is sent to an external collector. Range is **1** to **600** packets.
timeout-rate <*minutes*>	Specifies the time in minutes that passes between instances of resending the template information. Range is **1** to **3600** minutes.

Default Values

By default, template information is sent every **20** packets, and template information is re-sent every **30** minutes.

Command History

Release 16.1	Command was introduced.

Usage Examples

The following example configures the template information to be sent every **50** packets:

(config)**#ip flow export template refresh-rate 50**

In the following example, traffic flow template information is configured to resend every **15** minutes:

(config)**#ip flow export template timeout-rate 15**

Technology Review

When exporting traffic flow data, there are multiple types of information sent to the external data flow collector. There is data information about each traffic flow, system information about each traffic flow, and the traffic flow record itself. The information about the traffic flow record is called a template. Templates are used to describe the types and lengths of individual header fields within a traffic flow data record. Templates also communicate to the external data collector what type of information to expect in the ITM flow record.

The following tables describe the information contained in each template.

Table 1. Data Template Information

Source IP Address
Destination IP Address
Transport Protocol Type
Source Port
Destination Port
Type of Service (ToS) Bits
Packets in a Flow
Bytes in a Flow
Interface (Input or Output)
System Up Time of First Packet
System Up Time of Last Packet
Flow Direction

Table 2. Options (System) Template Information

Active-Flow Timeout
Inactive-Flow Timeout
Sampling Rate
Sampling Algorithm (Random)
Total Packets Exported to Collectors
Total Flows Exported to Collectors
Total Bytes Exported to Collectors

Templates are sent to the external data collector after a user-specified number of expired traffic flow entries. They are also re-sent periodically at user-defined intervals. The templates must be re-sent periodically because User Datagram Protocol (UDP) is often unreliable, and the collector may discard all traffic flow data lacking valid template information.

ip flow top-talkers

Use the **ip flow top-talkers** command to enable Top Talker functionality for integrated traffic monitoring (ITM) and enter Top Talker configuration mode. Use the **no** form of this command to disable the Top Talkers functionality and remove all associated settings.

> NOTE *For Top Talkers functionality to be enabled, ITM must be enabled on an interface. Refer to the **ip flow egress | ingress** command. Refer to ip flow on page 2202 for more information on enabling ITM.*

Syntax Description

No subcommands.

Default Values

By default, the Top Talkers feature is disabled.

Command History

Release 17.1	Command was introduced.

Usage Examples

The following example enables top talkers:

```
(config)#ip flow top-talkers
(config-top-talkers)#
```

Technology Review

Using the internal Top Talkers data collection feature of ITM, several of the most important flow cache statistics can be viewed at a glance from within the router itself. The Top Talkers feature incorporates the statistics of Top Talkers (top bandwidth users by source IP address), Top Listeners (top bandwidth users by destination IP address), and Port Lists (amounts of traffic observed on specific ports) into easily viewed output, accessed through either the command line interface (CLI) or Web-based graphical user interface (GUI). These statistics are captured by the metering process at the traffic flow observation point, and collected as traffic flow entries expire from the flow cache. These statistics allow the user to see the nature of traffic being processed by the router without having to configure an external server to collect data.

The internal Top Talkers data collector can be enabled instead of or in conjunction with an external data collector, or it can operate with no external data collector configured. Because Top Talkers collects and processes expired flow cache entries in a separate function from their exportation, it can function independently of an external collector. With both an external data collector and Top Talkers enabled, expired flow cache entries are sent to both the external data collector and through the Top Talkers collector. The separation of Top Talkers collection from external data collectors provides methods of separate data collector configuration, therefore, allowing the enablement of only Top Talkers collection, Top Talkers collection in addition to external data collection, or external data collection only. For more information on the ITM Top Talkers feature, refer to the *Integrated Traffic Monitoring configuration guide* available online at https://supportcommunity.adtran.com.

ip forward-protocol udp <*value*>

Use the **ip forward-protocol udp** command to specify the protocols and ports AOS allows when forwarding broadcast packets. Use the **no** form of this command to disable a specified protocol or port from being forwarded. Specifying the virtual routing and forwarding (VRF) instance using the **vrf** <*name*> keyword applies the command to the named VRF instance. Omitting the **vrf** <*name*> keyword applies the command to the default unnamed VRF. Specify a VRF instance other than the default by adding the **vrf** <*name*> parameter to the command as follows:

ip forward-protocol vrf <*name*> **udp** <*value*>

*The **ip forward-protocol udp** command can be used in conjunction with the **ip helper-address** command, issued in a valid interface, to configure AOS to forward User Datagram Protocol (UDP) broadcast packets.*

Syntax Description

<*value*>

Specifies the UDP traffic type (using source port).

The following is the list of UDP port numbers that may be identified using the text name:

biff (Port 512)
bootps (Port 67)
discard (Port 9)
dnsix (Port 195)
domain (Port 53)
echo (Port 7)
isakmp (Port 500)
mobileip (Port 434)
nameserver (Port 42)
netbios-dgm (Port 138)
netbios-ns (Port 137)
netbios-ss (Port 139)
ntp (Port 123)
pim-auto-rp (Port 496)
rip (Port 520)
snmp (Port 161)
snmptrap (Port 162)
sunrpc (Port 111)
syslog (Port 514)
tacacs (Port 49)
talk (Port 517)
tftp (Port 69)
time (Port 37)
who (Port 513)
xdmcp (Port 177)

Alternately, the <*value*> may be specified using the following syntax: <0-65535>. Specifies the port number used by UDP to pass information to upper layers. All ports below 1024 are considered well-known ports and are controlled by the Internet Assigned Numbers Authority (IANA). All ports above 1024 are dynamically assigned ports that include registered ports for vendor-specific applications.

vrf <*name*>

Specifies the name of the VRF on which to configure broadcast packet forwarding other than the default VRF instance.

Default Values

By default, AOS forwards broadcast packets for all protocols and ports.

Command History

Release 2.1	Command was introduced.

Functional Notes

Use this command to configure AOS to forward UDP packets across the wide area network (WAN) link to allow remote devices to connect to a UDP service on the other side of the WAN link.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured.

Usage Examples

The following example forwards all domain naming system (DNS) broadcast traffic to the DNS server with IP address **192.33.5.99**:

(config)**#ip forward-protocol udp domain**
(config)**#interface eth 0/1**
(config-eth 0/1)**#ip helper-address 192.33.5.99**

ip ftp access-class <*acl*> in

Use the **ip ftp access-class in** command to assign an access control list (ACL) to all self-bound File Transfer Protocol (FTP) incoming sessions. Use the **no** form of this command to disable this feature. Variations of this command include:

ip ftp access-class <*acl*> **in**
ip ftp access-class <*acl*> **in any-vrf**
ip ftp access-class <*acl*> **in vrf** <*name*>

Syntax Description

<*acl*>	Specifies the ACL to apply to the FTP traffic.
in	Specifies that the ACL is applied to incoming FTP connections.
any-vrf	Optional. Allows incoming FTP connections from any virtual routing and forwarding (VRF) instance.
vrf <*name*>	Optional. Allows incoming FTP connections from a specified VRF instance.

Default Values

By default, all FTP access is allowed.

Command History

Release 2.1	Command was introduced.
Release R10.7.0	Command was expanded to include the **any-vrf** and **vrf** <*name*> parameters.

Usage Examples

The following example applies the configured ACL, named **Inbound_FTP**, to inbound FTP traffic:

(config)**#ip ftp access-class Inbound_FTP in**

ip ftp server

Use the **ip ftp server** command to enable the File Transfer Protocol (FTP) server and optionally specify the default location for the FTP server to store and retrieve files. Use the **no** form of this command to disable the FTP server. Variations of this command include:

ip ftp server
ip ftp server default-filesystem cflash
ip ftp server default-filesystem flash
ip ftp server default-filesystem ramdisk
ip ftp server default-filesystem usbdrive0

Syntax Description

default-filesystem	Specifies the default file system for the FTP server to use.
cflash	Optional. Specifies the FTP server use the CompactFlash® card as the default file system.
flash	Optional. Specifies that the FTP server use the system flash as the default file system.
ramdisk	Optional. Specifies that the FTP server use the volatile RAM disk as the default file system.
usbdrive0	Optional. Specifies that the FTP server use the Universal Serial Bus (USB) flash drive as the default file system.

Default Values

By default, the **ip ftp server default-filesystem** is set to **flash**.

Command History

Release 13.1	Command was introduced.
Release 17.7	Command was expanded to include the **ramdisk** parameter.
Release 18.2	Command was expanded to include the **usbdrive0** parameter.

Usage Examples

The following example enables the FTP server:

(config)**#ip ftp server**

The following example specifies **cflash** file system as the default:

(config)**#ip ftp server default-filesystem cflash**

ip ftp source-interface <*interface*>

Use the **ip ftp source-interface** command to use the specified interface's IP address as the source IP address for File Transfer Protocol (FTP) traffic transmitted by the unit. Specifying the virtual routing and forwarding (VRF) instance using the **vrf** <*name*> keyword applies the configuration to the named VRF instance. Omitting the **vrf** <*name*> keyword applies the configuration to the default unnamed VRF. Use the **no** form of this command if you do not wish to override the default source IP address. Variations of this command include:

ip ftp source-interface <*interface*>
ip ftp vrf <*name*> **source-interface** <*interface*>

Syntax Description

<*interface*>	Specifies the interface to be used as the source IP address for FTP traffic. Specify an interface in the format <*interface type [slot/port	slot/port.subinterface id	interface id	interface id.subinterface id	ap	ap/radio	ap/radio.vap]*>. For example, for a T1 interface, use **t1 0/1**; for an Ethernet subinterface, use **eth 0/1.1**; for a PPP interface, use **ppp 1**; for an ATM subinterface, use **atm 1.1**; and for a wireless virtual access point, use **dot11ap 1/1.1**. Type **ip ftp source-interface ?** for a complete list of valid interfaces.
vrf <*name*>	Specifies the name of the VRF to which to configure the source interface.

Default Values

No default values are necessary for this command.

Command History

Release 6.1	Command was introduced.
Release 9.1	Command was expanded to include the high level data link control (HDLC) interface.
Release 14.1	Command was expanded to include the tunnel interface.
Release 15.1	Command was expanded to include the bridged virtual interface (BVI).
Release 17.1	Command was expanded to include the asynchronous transfer mode (ATM) interface.
Release A4.01	Command was expanded to include the Metro Ethernet Forum (MEF) Ethernet interface.
Release A5.01	Command was expanded to include the Gigabit Ethernet interface.
Release R10.7.0	Command was expanded to include the **vrf** <*name*> parameter.

Functional Notes

This command allows you to override the *sender* field in the IP packet. If you have multiple interfaces in your unit, changing the *sender* tells the receiver where to send replies. This functionality can also be used to allow packets to get through firewalls that would normally block the flow.

VRF on AOS products allows a single physical router to be partitioned into multiple virtual routers. Each router instance has its own route table and interface assignments. Beginning with Release 16.1, all AOS routers supporting multiple VRF instances (multi-VRF) have an unnamed default VRF instance regardless of whether multi-VRF is configured.

Usage Examples

The following example configures the unit to use the **loopback 1** interface as the source IP for FTP traffic:

(config)**#ip ftp source-interface loopback 1**

The following example configures the unit to use the **loopback 1** interface as the source IP for FTP traffic on the VRF RED:

(config)**#ip ftp vrf RED source-interface loopback 1**

ip hw-access-list extended <*name*>

Use the **ip hw-access-list extended** command to create and name an IP hardware access control list (ACL). This command also enters the ACL's configuration mode. Using the **no** form of this command deletes the IP hardware ACL.

For a complete list of all IP hardware ACL configuration commands, refer to the *Hardware ACL and Access Map Command Set on page 4235*.

Syntax Description

<name>	Specifies the name of the IP hardware ACL.

Default Values

By default, all AOS security features are disabled, and there are no configured hardware ACLs.

Command History

Release 17.6	Command was introduced.

Functional Notes
