

## NetVanta Unified Communications Technical Note

---

# Selecting NetVanta UC Server VMware and Platform Servers

This technical note specifies the minimum computer hardware requirements for NetVanta Unified Communication (UC) products, including which VMware virtual machines and platform servers are best suited to operate with the NetVanta UC Server versions 5.1 and later. This technical note discusses the following VMware and server selections:

- *NetVanta UC Server Platform Recommendations on page 1*
- *VMware Virtual Machine Configuration Parameters on page 4*

### NetVanta UC Server Platform Recommendations

The server components of the UC server support the following Microsoft® Windows operating systems:

- Microsoft Windows Server 2008 (32 bit or 64 bit)
- Microsoft Windows Small Business Server 2008 (64 bit)
- Microsoft Windows Server 2003 R2 (SP1 or SP2) (32 bit)
- Microsoft Windows Server 2003 (SP1 or SP2) (32 bit)
- Microsoft Windows Small Business Server 2003 (SP1) (32 bit)

Other software platforms are not supported. Of specific note, the deployment of the UC server on Server Core or Hyper-V is not currently supported.

*Table 1 on page 2, Table 2 on page 3, Table 3 on page 3, and Table 4 on page 4* list the specifications that ADTRAN recommends for use as server platforms for NetVanta UC Server versions 5.1 and later. The recommendations are made based on the number of users for the NetVanta Enterprise Communications System (ECS), the NetVanta Unified Communication Server (UCS), the NetVanta Business Communication System (BCS), and the number of channels for the NetVanta Business Application Server (BAS). The servers recommended are configured for expanded configurations, which have higher traffic levels, extensive databases or built-in data table usage, higher levels of text-to-speech (TTS) usage, complex auto attendants, extensive use of interactive voice response (IVR), outbound dialing, or personal business assistant (PBA) services requiring a large number of media channels. The expanded configurations use about 17 percent of the processor for the number of users or channels in the configuration. Therefore, the recommended servers have a considerable built-in processing safety margin for standard configurations. If you have a standard configuration, using a standard feature bundle with few feature additions, then you might be able to use a smaller, less expensive server platform.

When selecting your server platform, ADTRAN recommends that:

- You take future system growth of users, TTS, IVR, and database usage into account. Selection of a server that will accommodate future growth will typically save you money in the long run since the incremental cost of a larger server is much lower than replacing a server later. Additionally, you avoid the cost and inconvenience associated with server migration and service interruption.
- You select a server that exceeds the minimum requirements for your selected capacity including future growth. The server platform is the most critical hardware component in your UC server system, but it typically accounts for only one to three percent of the cost of your system. For a very marginal additional cost, adding cores, faster processors, or more sockets to your server provides additional peck capacity, decreases delays, and reduces the potential for problems.
- You take into consideration that as feature enhancements are added to the newer releases of the NetVanta UC systems, it is possible that the hardware requirements for the system will also increase over time.

## NetVanta ECS, UCS, and BCS Server Platforms

The recommended server platforms for the NetVanta ECS, UCS, and BCS with Windows Server 2003 and 2008 are listed in *Table 1*. The following assumptions are included when selecting a server platform for the NetVanta ECS, UCS, or BCS:

- The maximum calculated average CPU utilization is engineered to never exceed 34 percent under maximum sustained traffic load.
- An average amount of offered traffic (the industry standard is six congestion control schemes (CCS) per user).
- A moderate amount of TTS resources are included as part of the traffic modeling.

**Table 1. NetVanta ECS, UCS, and BCS with Windows Server 2003 and 2008**

Bundle Size (Number of Users)	Generic Specifications	ADTRAN Supported Platform Type
1 to 100	1 x Pentium G630, 4G 1333 MHz RAM, No RAID, 250G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	NetVanta 420E or PowerEdge R210 II
100 to 200	1 x Core i3-2100, 4G 1333 MHz RAM, RAID 1, 2 x 500G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	PowerEdge T110 II/R210 II
200 to 400	1 x Core i3-540, 4G 1333 MHz RAM, RAID 5, 3 x 500G SATA 7200 rpm, 100/1000 NIM, Dual Power Supply	PowerEdge T310/R310
400 to 1200	2 x Xeon E5603, 8G 1333 MHz RAM, RAID 5, 3 x 300G 15K rpm, Dual 100/1000 NIM, Power Supply	PowerEdge T410/R410
1200 to 2000	2 x Xeon X5650, 8G 1333 MHz RAM, RAID 5, 3 x 300G 15K rpm, Dual 100/1000 NIM, Power Supply	PowerEdge T410/R410

**Table 1. NetVanta ECS, UCS, and BCS with Windows Server 2003 and 2008 (Continued)**

<b>Bundle Size (Number of Users)</b>	<b>Generic Specifications</b>	<b>ADTRAN Supported Platform Type</b>
<b>1200 to 2000+ (Redundant Power Option)</b>	<b>4 x Xeon E7-4807, 16G 1066 MHz RAM, RAID 5, 3 x 300G 15K rpm, 100/1000 NIM, Dual Power Supply</b>	<b>PowerEdge R910</b>

*The NetVanta UC Server does not support more than 2000 users, however, you can select a server that will support more users for other desired functionality, such as a redundant power supply.*

The recommended server platforms for the NetVanta ECS, UCS, and BCS coinstalled in Windows Small Business Server 2003 and 2008 are listed in [Table 2 on page 3](#) and [Table 3 on page 3](#).

**Table 2. ECS, UCS, and BCS with Windows Small Business Server 2003**

<b>Bundle Size (Number of Users)</b>	<b>Generic Specifications</b>	<b>ADTRAN Supported Platform Type</b>
5 to 10	1 x Xeon E3-1230, 4G 1333 MHz RAM, No RAID, 500G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	PowerEdge T110 II/R210 II
10 to 24	1 x Xeon E3-1230, 4G 1333 MHz RAM, RAID 1.2 x 500G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	PowerEdge T110 II/R210 II
25 to 75	1 x Xeon X3460, 4G 1333 MHz RAM, RAID 5, 2 x 500G SATA 7200 rpm, 100/1000 NIM, Dual Power Supply	PowerEdge T310

**Table 3. ECS, UCS, and BCS with Windows Small Business Server 2008**

<b>Bundle Size (Number of Users)</b>	<b>Generic Specifications</b>	<b>ADTRAN Supported Platform Type</b>
5 to 10	1 x Xeon E3-1230, 8G 1333 MHz RAM, No RAID, 500G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	PowerEdge T110 II/R210 II
10 to 25	1 x Xeon E3-1230, 8G 1333 MHz RAM, RAID 1.2 x 500G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	PowerEdge T110 II/R210 II
25 to 75	1 x Xeon X3460, 8G 1333 MHz RAM, RAID 5, 2 x 500G SATA 7200 rpm, 10/1000 NIM, Dual Power Supply	PowerEdge T310

## NetVanta BAS Server Platforms

The recommended server platforms for the NetVanta BAS with Windows Server 2003 and 2008 are listed in [Table 4 on page 4](#). The following assumptions are included when selecting a server platform for the NetVanta BAS:

- The maximum calculated average CPU utilization is engineered to never exceed 34 percent under maximum sustained traffic load.
- Maximum load is considered using 100 percent channel occupancy with 30 second call durations.
- TTS is used approximately 33 percent of the time in services (that is, a ratio of one TTS voice channel per ever three media channels).
- The number of conference channels in use is equal to the number of channels.

**Table 4. BAS with Windows Server 2003 and 2008**

Bundle Size (Number of Channel)	Generic Specifications	ADTRAN Supported Platform Type
1 to 10	1 x Pentium G630, 4G 1333 MHz RAM, No RAID, 250G SATA 7200 rpm, 100/1000 NIM, Single Power Supply	NetVanta 420E or PowerEdge R210 II
10 to 40	1 x Core i3-540, 4G 1333 MHz RAM, RAID 5, 2 x 500G SATA 7200 rpm, 100/1000 NIM, Dual Power Supply	PowerEdge T310/R310
40 to 70	2 x Xeon E5603, 8G 1333 MHz RAM, RAID 5, 3 x 300G 15K rpm, Dual 100/1000 NIM, Power Supply	PowerEdge T410/R410
70 to 200	2 x Xeon X5650, 8G 1333 MHz RAM, RAID 5, 2 x 300G 15K rpm, Dual 100/1000 NIM, Power Supply	PowerEdge T410/R410

## VMware Virtual Machine Configuration Parameters

The following sections provide the configuration parameters that ADTRAN recommends for use with VMware virtual machines for all versions of the NetVanta UC Server running 5.1 or later. The recommendations are made based on the number of users for the NetVanta ECS, UCS, and BCS, and the number of channels for the NetVanta BAS.

### RAM/Mass Storage/PCM for NetVanta ECS, UCS, and BCS

The recommended amount of RAM, mass storage, and processing capacity multiplier (PCM) for VMware virtual machines used with the NetVanta ECS, UCS, and BCS with Windows Server 2003 and 2008 are listed in [Table 5 on page 5](#).

**Table 5. RAM/Mass Storage/PCM for NetVanta ECS, UCS, and BCS**

<b>Number of Users</b>	<b>RAM (GB)</b>	<b>Mass Storage (GB)</b>	<b>PCM</b>
5	4	32	5
10	4	32	10
15	4	32	15
25	4	32	25
50	4	32	50
75	4	34	75
100	4	34	100
125	4	34	125
150	4	35	150
175	4	35	175
200	4	36	200
225	4	36	225
250	4	36	250
300	4	38	300
350	4	39	350
400	4	40	400
500	4	42	500
600	4	44	600
800	4	48	800
1000	4	52	1000
1200	4	58	1200
1400	4	62	1400
1600	4	66	1600
1800	4	70	1800
2000	4	74	2000

## RAM/Mass Storage/PCM for NetVanta BAS

The recommended amount of RAM, mass storage, and PCM for VMware virtual machines used with the NetVanta BAS with Windows Server 2003 and 2008 are listed in [Table 6](#).

**Table 6. RAM/Mass Storage/PCM for NetVanta BAS**

Number of Channels	RAM (GB)	Base Mass Storage (GB)	PCM
10	4	32	100
20	4	35	320
30	4	37	600
40	4	40	960
50	4	39	1100
60	4	41	1440
70	4	44	1680
80	4	46	2080
90	4	51	2520
100	4	54	3000
110	4	57	3300
120	4	60	3600
130	4	60	3900
140	4	62	4200
150	4	62	4500
160	4	62	4800
170	4.5	69	5100
180	4.5	69	5760
190	5	77	6080
200	5	77	6400

## Determining the Required VMware Processing Capacity (in MHz)

VMware vSphere indicates and reserves processing capacity in terms of processing cycles in MHz. You can determine the processing capacity requirement in MHz for standard deployments by multiplying the PCM value in [Table 5 on page 5](#) and [Table 6 on page 6](#) by the VMware MHz per user for the Intel Xeon processor type in use in your VMware server from [Table 7 on page 8](#). If you do not want to engineer your solution, use the CPU requirement for an enhanced configuration, and multiply the capacity required in MHz for a standard deployment by a factor of two.

## Ensure Adequate Call Processing Capacity in the VMware Server Processors

You must ensure that the processors in your VMware vSphere server platform have adequate call processing capacity for your deployment. The maximum calls per second associated with the server's processors in [Table 7 on page 8](#) must be greater than or equal to the call processing rate required by your deployment. Multiply calls per second by 3600 to determine the estimated number of busy hour call completions (BHCC) that can be accommodated by the processors in use. If the call processing rate of the processors in your server is not adequate for your deployment then employ a server with a processor that has a higher call processing rate. You might have to choose a server with a different processor configuration having higher clock rates, lower numbers of cores per processor, no hyper-threading, or few populated server sockets in order to achieve a higher call processing rate.

## Configuring VM Logical Processors

In general, more logical CPUs provide better performance for the NetVanta UC Server. Therefore, you must configure at least two virtual CPUs in your virtual machine, but more will provide better performance. You might have to configure more virtual CPUs in your virtual machine in order to achieve the processing capacity that you require in MHz.

## Detailed VMware Configuration Information

When configuring a VMware vSphere virtual machine for NetVanta UC Server, you must specify all the same information that you would normally specify for a server-based deployment. This includes the operating environment and how much RAM, mass storage, and processing capacity is required. Once you have determined your Windows operating environment, determine the RAM and mass storage requirement for your virtual machine (refer to [Table 5 on page 5](#) and [Table 6 on page 6](#)). Lastly, specify the processing requirement for your virtual machine. VMware vSphere indicates and reserves processing capacity in terms of processing cycles in MHz. You can specify the processing requirement by using the VMware MHz per user column in [Table 7 on page 8](#). This value is an estimate of the processing capacity required per user by NetVanta UC Server for the processor type in use in the server.

To determine the processing capacity required in your virtual machine for standard deployments, multiply the numbers of users in your configuration by VMware MHz per user for the processor in use in your VMware host server (refer to [Table 7 on page 8](#)). Use the following equation:

$$(\text{MHz/User} \times \text{Number of Users}) = \text{VMware processing capacity required}$$

If you do not want to engineer your solution, use the CPU requirement for an enhanced configuration and multiply the capacity required in MHz for a standard deployment by a factor of two.

## MHz per User/Maximum Calls per Second for Recent Intel Xeon Processors

[Table 7 on page 8](#) describes the MHz per user and maximum calls per second for Intel Xeon processors. These statistics can be used to determine the processing capacity required in VMware virtual machines for NetVanta UC deployments.

**Table 7. MHz per User/Maximum Calls per Second for Intel Processors**

<b>Intel Processor</b>	<b>MHz per User</b>	<b>Maximum Calls per Second</b>
Xeon E3-1220	4.46	325
